Extract from the Political Code.

SECTION 2296. Books may be taken from the Library by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS THEREOF, and by other State officers at any time.

SEC. 2298. The Controller, if notified by the Librarian that any officer has failed to return books taken by him within the time prescribed by the Rules, and after demand made, must not draw his warrant for the salary of such officer until the return is made, or three times the value of the books; or of any injuries thereto, has been paid to the Librarian.

SEC. 2299. Every person who injures or fails to return any book taken is liable to the Librarian in three times the value thereof.

No person shall take or detain from the General Library more than two volumes at any one time, or for a longer period than two weeks. BOOKS OF REFERENCE SHALL NOT BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from the Rules.]

—The Foregoing Regulations will be strictly enforced.—

California Raisins.

The good time coming seems to be right at hand in the matter of California raisins, and in view of the rapid increase of the product it is a matter for congratulation. We have been contending for years for two things: first, to make our product both as good and as stylish as the European article, and, second, to convince Eastern consumers of the fact. It seems both these things are, in a measure at least, accomplished. One of the largest firms of dealers in New York, in a circular dated June 1st, says:

The larger receipts of California raisins the past year has resulted in so scattering them that acquaintance with them has been multiplied in all directions. So greatly improved have been most of the lots sent that comparatively little remains to suggest, while the uniformity of quality in the box and general uniformity of entire invoices exceeds that of similar foreign raisins. In a word, we find them received with general favor, and in many cases preferred to foreign.

Though this indicates great accomplishment on the part of our producers, it should not suggest the slightest relaxation of the effort for uniformity and excellence which has secured it. The experience of our canners a few years ago in canning trash because the California product was selling upon its name, should be a warning to all producers that a good name may be lost as well as gained, and generally lost in a fraction of the time required to gain it. There is still room for great improvement in our raisins. If all were as good as the best, what a vast increase of money our State would gain from its raisin product. This state of affairs will never be attained in the very nature of things, but if the effort for excellence continues as it has for the last 10 years, our best will be the fancy article of the world, and our average will stand far in advance of the imported product. Let the effort then still be for the most careful selection of fruit, for the most excellent curing and packing, and for honest uniformity throughout the package, and full weight above all things. Our product can be hurt now only by carelessness or cupidity. These two things have wrought such sorry results in the history of productive enterprises, that California, having all this experience to profit by, should learn a lesson for her lasting good.

WHEAT CROP OF THE WORLD.—In a country like England, where so much attention is given to manufacturing and where the produce of the soil does not support the inhabitants, a close watch is kept upon the food supply to be obtained from other nations. Accordingly the supply is forecasted by economists and grain-brokers with a great deal of precision. So far the impression on the British mind is that the world's supply of grain this year will be short. Naturally the first attention would be given to home prospects, and next to India. In England the harvest this year will be late, and its product will depend on favorable weather, not to be relied on. At best, it will be far short of the needs of the population. The crop in India is short. The American crop is set down below the average, although the lands sown to spring wheat promise well. The Russian crop looks fair. Australia will yield a small surplus, and the wheat regions of South America will yield well. The chances for good rates for cereals are better than usual, and farmers who have grain may reasonably expect good prices.

George Washington.

For a century or more the average patriot's idea of Washington has been that of a petrified soldier standing erect or sitting upon a perpetual horse, clad in continental regimentals, with the winter at Valley Forge, the march across Jersey, Trenton, Princeton, Monmouth Court-house and Yorktown stamped in durable rigidity upon his face. That grave, sedate countenance has become rooted in the mental photograph of every man, woman and child. To draw any other picture of the "Father of his

Washington certainly ate and chewed victuals like the rest of us; slept, perhaps snored, and had the toothache. And to tell the truth, we have always liked Washington better ever since we read how he gave Gen. Lee, at Monmouth, a little cursing for his cowardice or villainy in disobeying orders; not that we approve of swearing; for we do not, but we catch at everything that makes Washington a real man. The age of demi-gods has passed.

THE WEATHER AND CROP BULLETIN of the Signal Service reports the weather during the

WASHINGTON IN 1772.

Country" may seem to some, even in this iconoclastic age, as downright blasphemy.

But now comes the Rev. Ed. Everett Hale of Boston, and says that our Washington was human, that he traded horses sharply, liked pretty girls, would sometimes use a cuss-word, get angry and throw a pitchfork at a negro. These Boston preachers have no reverence. The next thing we know some of them will be asserting of their own knowledge that our George cheated at marbles when a boy, stole water-melons, ran after dog-fights, and several times got into the watch-house. That he whistled negro melodies, danced hoe-downs on the corner of the street while some one patted juba. Pour it all out at once while you are at it. When you commence to tar and smut a sacred name, smear it on thick, and don't do it half-way.

But when we come to think of it, why not?

week ending June 25th as generally favorable for the principal crops. The rains in the South Atlantic States have doubtless improved the condition of the staple crop in that region. More rain is needed in the cotton districts. The weather has been favorable for harvesting in the wheat region, there having been an excess of sunshine and very little rain. In the corn region, the weather has been generally favorable, although in some localities more rain is needed, and the cool weather of the past week must have slightly retarded the growth of the corn crop.

DR. ALFRED R. WALLACE, the eminent English scientist, returned a few days ago from a trip through Sonoma county, and honored our sanctum with a call.

LOS ANGELES is to make a fruit show at St. Louis during the Grand Army Encampment.

The Land of Booms.

"And they sailed away to the land of booms."

The above might be made the refrain of many a melody at this time, for we are having booms all along the line. In the East we have oil booms and railroad booms and booms of almost every kind and character. There has been no period in the world's history when there was such a marked activity in large industrial operations as just now—when there were such wonderful developments in every essential of the world's progress. Never before was the opportunity presented for the rapid amassing of large fortunes. Millionaires and multiple millionaires are as plenty now as were those 30 years ago who counted their wealth only by a few hundred thousand. Monopolies, corners and speculations of every kind are of daily occurrence at every important commercial center. Great works of engineering in the damming of streams, building of bridges, digging canals, building railroads to far-off and what were formerly considered unapproachable places, are now events of every-day undertaking. Huge leviathan ships of several thousand tons burden have taken the place of those of 500 or 600, which were considered large ships a few years ago. Tiny cockleshell yachts of a few tons burden are now built to move through the water at what was formerly considered an unattainable speed.

Gold, silver, copper and lead are now raised in quantities which would have been regarded as fabulous 40 and 50 years ago. Large sections of country are lighted up with furnace fires fed by the products of our iron and coal mines, which are now yielding their output in such immense quantities as to tax the skill and capital of both railroad and steamer to move them from pits to furnaces. There is a veritable boom in every class of mining. "A New South" is just being opened up to the industry and capital of the country. That genial portion of the Union was never so alive to the sound of the ax, the hammer, the saw and the mill-wheel as now; the boom there is genuine and unprecedented. A great empire has grown up within the life of a generation in the great Northwest, and another has made almost equal progress on the Pacific Slope.

Pig Iron Bessemer said two years ago that 1887 was to witness the beginning of the biggest boom the world ever saw—his prediction is being more than verified.

California was never so active as now in all the essentials of real progress. The whole State is alive and stirring as if of one accord. The boom which first made its appearance in Southern California about one year ago is spreading throughout the State—from Mexico to the Oregon line. The only question is: Will it last? We believe it will. The boom has not yet struck the middlemen and laboring community with its full force. But it is surely coming to them also, and in time will reach all, if the great mass of the people are only true to themselves; for this is emphatically a producing nation, and the people, as a whole, can be depended upon to do their duty to both themselves and the public by each one doing something, creating something, producing something, to swell the grand aggregate of labor and effort out from which genuine booms always come.

ABOUT 76,000 sheep are being driven from various points in Oregon to Nebraska this year.

FLORICULTURE.

The Care of Tender Plants.

[Written for the Rural Press by GARDENER.]

By tender I do not mean those which are difficult to grow, but such plants as roses, pelargoniums, heliotropes, fuchsias, carnations and the like, which, in order to give fine blooms, need cultivation and care, in opposition to those which bloom well without it. Indeed, I think no one who expects to have a garden raised on the principle by which Topay "just grew" ought to plant any of these I have named.

It is true that, even when miserably neglected, such plants will sprawl through an unsightly existence, and one or more of them are oftentimes seen doing nicely in an otherwise utterly neglected garden; but, as a general rule, it will be found either that extra care was given them while young, securing a vigorous start and a constitution able to withstand after neglect, or else that they receive semi-occasionally a little extra attention in the shape of water or digging.

It is difficult to believe, till you have seen, the difference between the blooms from a sickly, stunted plant and those from one under good cultivation and doing its best. I know of no rosebush which, if sickly, gives more unsatisfactory or poorer blooms than the Marechal Niel or the Arch Duke Charles, yet the first is the finest yellow tea-rose grown, and the second, when perfect, one of the most lovely imaginable.

Frequently, flowers which ordinarily you would pass by without a second glance will, when carefully attended, be the most exquisite; therefore a few hints on the care of such may not be amiss.

Attention to Cultivation and Pruning.

The first thing to be attended to, then, is the soil. Try to keep it at least reasonably soft around them, although it is not necessary to have it like meal, merely digging it deeply and loose enough so that their little rootlets may find a way.

Next to digging—almost, I was going to say, here in California, more necessary—is frequent trimming and pruning.

In parts of the country where the ground freezes solid all winter and the heat burns them all summer, so that they have but a short time for growing each year, this rule will, of course, not hold good; but in California, where, with reasonable care, a plant will grow steadily, increasing in size the year round, it is a different matter.

A great many here still follow the old Eastern plan of doing all their pruning of plants in the fall; but it seems to me that where plants grow and act so differently there may be difference in treatment also, and in a climate so mild that we may gather carnations and heliotropes to deck our Christmas-trees, we need scarcely be governed by the same rules which apply in a climate where all plants must be taken up and carefully prepared to withstand the winter's cold, and force them for blooming in the spring.

Not only with roses, but with any of the plants I have named, frequent and severe clipping is a great aid to their health and subsequent growth, not to mention size and beauty of the blooms.

Carnations.

I was once advised by a friend, himself very skillful with flowers and extremely fond of them, never to bother with carnations. Said he: "They always grow straggling and sprawling, and never look well unless you are forever tying them up, and you will get no satisfaction from them." I mentally resolved that I would have carnations, and moreover that I would not have them either straggling or sprawling. I reasoned that the same general treatment ought to hold good with all plants to some extent, and therefore, instead of allowing mine to grow from year to year at the tips, as is usually done, presenting a lot of dry, unsightly stalks with a patch of green at the end, dragged down by the weight of the flower-buds, I proceeded to take my shears and cut them back to "bedrock," which meant that nothing but the bare brown stalks were left, standing about six inches high.

It was a doubtful experiment, for I knew nothing practically about their needs, and several flower-wise neighbors told me they were ruined. I protested stoutly that what was a good rule should be sauce for the goose as well as the gander, but was gravely informed that carnations were not like anything else, and couldn't be treated like roses. As a consequence, when, some three or four months after, my carnations (having been carefully dug around and watered in the meantime) put on a new green top of young shoots and stood literally loaded with buds, I was in no small degree elated.

But a short time ago on inquiring of a florist, who formerly grew large quantities of them, the reason of their scarcity, I was told that he "used to keep lots of 'em, but somehow they don't amount to anything; they grow a year or two and just die out."

At the same time, as I write, I can see three carnation plants—two of them five years old, the third being one of the originals on which I first experimented eight years ago. How old it was at that time I do not know, though it

was probably two years old at least; but at present it has on it, by actual count (I have counted as a matter of curiosity), 646 buds and blossoms, the whole plant looking like a newly rooted one.

The fact is that wherever cutting is done it forces new shoots, and these new shoots produce the flowers; therefore the more new shoots you can force the more flowers you will have, and vice versa.

Fuchsias.

A great many object to cutting fuchsias, as they think their natural drooping habit more graceful, and I even once heard an expostulation from a lady on the "barbarity" of "cutting the graceful fuchsia into a stiff shrub." However, I think that lady will find that her "graceful" fuchsia will in a short time be flowerless, and, although I do not agree with her that a fuchsia properly trimmed is anything approaching the ungraceful, still if the choice lies between grace and blooms, I prefer the blooms.

Just as soon as my plants (of any kind except annuals) give signs of being nearly out of bloom, and the foliage looks dry and no longer fresh, I cut them back with no gentle hand and rest them for new efforts. This not only does not prevent them from attaining size but rather seems to force rapid growing and vigorous shoots.

Heliotropes

Are greatly benefited by this trimming, and more particularly by a liberal application of soap-suds. I know of no plant which responds so readily to this stimulant, and I have had a dark-purple heliotrope, the tenderest and poorest bloomer of the whole family, give me great sprays of deepest purple blooms eight inches across, for two or three months after receiving a few bucketsful of suds.

Pelargoniums

Are benefited by cutting for two reasons; one, of course, the production of flower shoots, but also because they are brittle and easily broken, naturally growing with long, slender branches. By keeping them cut back to a round stocky bush, not only do they give a mass of bloom, but are prevented from being broken by the wind, etc. It takes very little frost to affect these and heliotropes, and even around Oakland they will often be killed if left uncovered during the winter nights. To cover them do not use anything heavy enough to break them; a newspaper does as well as anything, and is generally sufficient if properly secured over the top.

Other Plants.

Bulbous plants, lilies, gladiolus and the like require rich soil (it can hardly be made too rich) and moisture.

Dahlias, too, are plants which require the richest possible soil, and when supplied it gives most magnificent flowers for distant effects. Unless one is troubled with moles or gophers I think there is no necessity of taking up the bulbs or tubers here in California during the winter months, though I know many do so.

Roses, especially the red varieties, need the sun and all the richness of soil you can give them. Wood ashes or powdered charcoal are also excellent for them.

Deep cultivation (for any plants) takes the place of water to a great extent, though they do still better if they have a plenty.

All plants of whatever sort should have the blooms cut as soon as they begin to fade. Not only do the old blooms disfigure the appearance of the plant but the forming of seeds is a very exhausting one, and should be prevented as much as possible.

Watering.

When you water, do so at night, and thoroughly. You may think when you use a rose nozzle that you are putting on an immense quantity of water, when, in reality, you are giving them but little. Take a bucket and fill it from the sprinkler, and see how long it takes, and you will be able to judge about how much you are putting on. A well-grown plant, to get a good soaking, needs the equal of three or four wooden buckets of water, and to put them on with a sprinkler takes time and patience.

Do not allow the water to run with the full force of the stream, as it hardens the ground; moreover, if your soil is of the sort which packs, do not wet the whole bed, but only the individual plants, if possible covering afterward with dry soil. Of course, in a large garden, the labor of this renders it impracticable, but where there are few plants it may be done, and acts as the stitch in time which saves nine. Another way to hoard the moisture is to use a mulch of some kind around their roots. Good strawy manure is the best, but half-rotted straw, leaves, or even weeds pulled from the garden, do very well in lieu of better.

Give your roses, carnations, pelargoniums and such the sunny spots; the fuchsias, heliotropes, lilies, etc., the partial shade. Fuchsias do well anywhere if watered and cultivated, but their blooms are finer in the shade. Give your plants plenty of room and do not crowd them, setting them far enough apart so that they may all get the sun.

The difference in the size and beauty of the blooms seen at the florist's and those taken from private gardens is not by any means to be attributed always to their being grown under glass, for many of the cut flowers sold are grown in the open air. The great difference is in the constant, daily, intelligent care each variety receives, and when we give them the same care we shall receive the same results.

North Temescal.

HORTICULTURE.

State Horticultural Society Meeting.

The regular meeting was held in this city June 24th and was well attended. President Hilgard being unavoidably absent, Mr. Shinn was chosen as chairman of the meeting. After the reading of the minutes of the preceding meeting, Messrs. H. W. Rice of Haywards and I. Allegretti of West Berkeley were elected members of the society. The names of S. L. Goldman of San Francisco and W. A. Fisher of Napa were proposed for membership.

Fruit Exhibits.

There was exhibited a specimen of cherimoyor or custard apple grown by Joseph Sexton of Goleta, Santa Barbara county. The fruit was pear-shaped, about 4½ inches in diameter, the surface having something like pineapple markings, the color greenish, turning to yellow as ripening progresses. The fruit was unripe, but excited much interest for its novelty. The specimen will be kept for ripening by the secretary.

R. J. Trumbull showed a fine sized apricot ripening at San Rafael, nearly with the Pringle and considerably ahead of the Royal. He did not know the variety or whether it was a seedling or not. No one present could give the information.

James Shinn showed St. Ambrose apricots, quite large and handsome but still long from ripening.

The secretary showed Centennial cherries sent him by Leonard Coates of Napa, June 12th, being picked the day before. They were placed on a pantry shelf to see how long they would keep. At the meeting June 25th, they were still sound and handsome.

Fruit Reports.

B. M. Lelong, secretary of the State Board of Horticulture, submitted a long report on the condition of the fruit crop, with special reference to the excessive hot spells and frosts which have visited the State since April. The correspondence upon which the report was based covered nearly the whole State. We give below an outline of the report in condensed form, grouping the replies by counties:

Shasta County.

C. C. Bush, Redding: No damage in this vicinity from hot weather or frost this season. Fruit crop is exceptionally good up to this time. No insects or blights have been reported.

J. M. Lowe, Anderson: Fruit trees are all loaded to their fullest capacity. Bartlett pears very full. No damage has been done by heat, and the fruit crop promises to be a perfect success in all respects, except plums and prunes, which will not be more than half a crop.

Butte County.

John Bidwell, by G. M. Gray, Chico: Hot weather burned the China pears but did not hurt Bartlett; they stick tight and are a splendid crop. Peaches were not injured, but apples were burned on west side of the tree, and white cherries were burned and bruised somewhat. The codlin moth is our worst pest, but it is not as bad as last year. We have been over the bands twice this year, and one time found 1200 larvae. Two years ago we caught 17,500 worms the first time over. I think the reduction is because of close attention to the bands and spraying with sulphur and soap when the fruit was small.

Sutter County.

S. J. Stabler, Yuba City: The hot weather did not affect pears or peaches. Peach crop best we ever had, especially late varieties. Hot winds in May injured small fruit seriously. Estimate of the fruit crop of this county: Peaches, 1500 tons; apricots, 500 tons; pears, 200 tons; apples and nectarines, nominal; very few cherries in the county. No perceptible injury from frost.

Colusa County.

(Report unsigned.) Have not been able to detect any damage by heat. Fruit crop in this immediate vicinity I should estimate about 80 tons of raisin and table grapes, 1600 boxes of peaches. Other fruits are not yet in bearing. Frost did some injury to vines, but not to pears.

Yolo County.

Geo. W. Hinclay: The heavy norther blew off the pears. Bartlett crop light. So far as I know, no damage from codlin moth, yet attribute this to neighbor Thissell's bug trap, which has caught up all the codlins in this section of county.

J. R. Wolfskill, Winters: The hot weather caused the Bartlett pears to drop badly; also lost a few peaches and many apricots; Royals dropped one-fifth of the crop. Of the fruit crop I would say: Apricot yield, large; peaches, good; prunes, none; pears, fair; very few codlin moth larvae so far.

Webster Treat, Davisville: Hot weather of May 27th and 28th caused all kinds of pears to drop to some extent, but did no damage to peaches. Have not seen any codlin moth larvae this season. No injury by peach moth, no blight, no fungus.

Solano County.

A. T. Hatch, Suisun: Bartlett pears dropped from whipping of the wind, not by heat; peach-

es also suffered in the same way but not to any extent; yellow egg plums badly burned; gooseberries badly damaged; cherries, considerably. The crop of apricots, peaches, pears, nectarines, and almonds is large. Very few codlin and peach moth larvae this season. No blight on pears this year.

Napa County.

Leonard Coates, Napa: Bartlett pears have not dropped more than usual. We count a north wind good for pears, as likely to check fungoid diseases. Peaches are dropping somewhat. Small fruits and cherries were most injured by the hot spell. The fruit crop generally is a very fair average; peaches and apricots being above the average, though some are still falling off. Codlin moth larvae is hardly to be seen. I think the cold weather killed off the first moths. Last year at this time there were plenty of the larvae. The peach moth was very troublesome early in the season; also twig-boring beetles. We have about as much pear blight as usual. Washes do not seem to have done any good, but the north wind reduced it.

Sonoma County.

Robt. Hall, Sonoma: Pears were not injured by the hot weather, nor have they thinned themselves enough. Where trees were pruned heavily, there is a good crop free from blight. Where there is too much wood and a mass of foliage, they are more subject to fungus. Will be a fine peach and apricot crop. Hot weather caused plums to drop, but enough remain to make a good crop. Fruit outlook better than for several years. There is, however, great danger of high winds; if it blows as strong later as it did a few weeks ago, much of the fruit will undoubtedly be knocked off.

Luther Burbank, Santa Rosa: No injury to Bartlett's, and the trees are loaded. Winter Nellis is a failure this year, peach trees are overloaded; some apricots and apples dropped, but the apricot was never so fruitful as this year. French prune crop is short; Bartlett pears as usual; apples short. Codlin moth has done great damage in three years past; have not seen it yet this year. I see no apple and pear blight this season.

W. H. Pepper, Petaluma: The hot weather burned but few peaches, but at least half my plum crop was cooked by it. Some apples were burned; Newtown pippins and many other kinds set very light. Young trees in some parts of nursery were badly damaged by the frost in April. No apple worms so far, but I think it is not time for them to show yet, as the spring is so late.

Alameda County.

E. Munyan, Newark: Pears and peaches not injured by the heat, but blight is appearing on the Bartlett pears within the past week. Apples burned badly; cherries somewhat injured; gooseberries and currants almost ruined; plums are falling off fast. In this vicinity apples and pears will be about an average; peaches, apricots and quinces very heavy; plums fair; black cherries a good crop; Royal Ann almost a failure, the latter being injured seriously by the frost. Codlin moth does great injury. Pears slightly blighted, but helped by washing with wood ashes and lime.

Jas. Shinn, Niles: Pears and peaches uninjured by the heat; apples burned to some extent on the south side of the tree. No injuries from frost. Codlin moth very destructive last year, but not noticeable so far this year, probably because the season is so late. My pears of all kinds are unusually clean of all fungus.

W. C. Blackwood, Haywards: No injury to tree fruits, except plums, by the hot spell, and no dropping, to any extent, of fruit. Currants and gooseberry crops about one half destroyed; yellow and egg, Jefferson and Coe's Golden Drop badly damaged. No codlin moth has appeared yet. Paris green and London purple have been widely used, but it is too early to know the results. Have not heard of any damage by peach moth nor any blight on pears or apples.

C. C. Chase, Irvington: No damage to pears or peaches by the hot weather. Apple trees affected with blight, but cannot state amount of damage.

J. L. Beard, Centerville: No injury to pears; peaches are dropping somewhat, but not more than usual. Hot weather cooked two-thirds of my gooseberries and currants. Think I lost \$3000 worth of them. Plums were considerably injured, especially Jefferson. Codlin moth is very bad; last year lost one-quarter of my pear crop.

H. W. Meek, San Lorenzo: Hot weather did no injury to pears or peaches, but small fruits were badly burned; currants were injured at least 40 per cent; gooseberries 25 per cent, plums are not more than half a crop. Codlin moth larvae appeared to slight extent on June 15th, but not as numerous as last season.

Santa Clara.

John Britton, San Jose: Pears and peaches are dropping badly from blight and cold nights. In some localities the damage by frost was serious. Codlin moth has appeared, but cannot state to what extent yet. Last year it took three-quarters of the pear and apple crops.

A. Block, Santa Clara: The hot weather caused considerable injury by dropping of pears, peaches—late Crawfords worst—egg plums and Moorpark apricots. I have not data for a close estimate of the crop of the county, but I think there will be 5000 tons of apricots. Codlin worms have appeared, but in small

numbers, owing, I think, to lateness of the season.

San Benito County.

H. Donnelly, Hollister: Hot weather did but little damage. Codlin moth injurious in past years, but has not appeared so far this year. No peach moth; some blight, but not to any great extent. Fruit crop generally good.

John W. Green, Hollister: No damage to fruit crops. Estimate crop of the county at 450 tons.

Sacramento County.

Sol. Runyon, Courtland: Hot spell did no damage in this section unless it was to grapes which were just setting. We promise to have a full crop of peaches, apricots and apples; pears and plums are somewhat short. There has been no damage by frosts this season except to grapes in some parts of the county. I have not seen much of the codlin moth larvæ yet, and the peach moth is not as bad as last year.

C. W. Reed, Sacramento: No damage by heat in my orchard. Fruit crop is good except plums. Grapes injured here and there by the frost. Codlin moth larva has made its appearance. I have picked all the infested fruit, but do not think I have more than ten per cent as much as last year. No peach moth this year. No blight of pear or apple trees.

Sperry Dye, Walnut Grove: North wind dropped Bartlett pears, but the main injury was done, I think, by the striped beetle (*Diabrotica vittata*), which destroys the petals of the flowers, and the small pears fall. No other variety than the Bartlett is affected. Hot spell did no damage to peaches, nor has there been any injury by frost. Codlin moth larva has appeared, but not to any extent so far. Peach moth not abundant. I have not heard of blights or fungus diseases here this season. Have used B. M. Lelong's winter and summer washes with excellent results.

C. T. Davis, Richland: Heat caused too many Bartletts to drop. No effect noticed on the peach crop. Fruit crop of the county will exceed that of 1885. No damage by frost. Codlin moth has appeared as bad as ever. Apples are dropping off badly.

Placer County.

N. R. Peck, Penryn: Hot weather did no harm to pears and peaches, but burned apples on north side of tree. Injured some kinds of plums a little; caused oranges to drop. Fruit crop will be large, excepting plums. Frost hurt nothing but grapevines, and the damage was slight. Codlin moth has appeared, but not as bad as heretofore. No blight or fungus diseases reported.

P. W. Butler, Penryn: All varieties of pears promise full crop. No injury by hot weather. Peaches will be abundant, though some injury was done to the young trees by the cold weather of May 10th. The heat caused oranges to drop, and greatly reduced the raspberry crop. Peach and pear crop will doubtless be double that of any previous year.

C. M. Silva, Newcastle: Pears dropped badly before the hot weather came on, but there are still enough on the trees for a fair crop. No damage to peaches and the crop is large. Plum crop is light; full crop of nearly all other kinds of fruits. Vines on low ground somewhat injured by frost, but on high ground not at all.

El Dorado County.

E. G. M. Mortensen, Pilot Hill: No damage by heat to pears or other fruit, but some injury by frost and codlin moth. Fruit crop for Coloma section will be about one-third, being attributed to frost of May 11th. Peaches suffered most and pears the least. Codlin moth is our most injurious pest. Early varieties of apples are all dropping.

Nevada County.

Felix Gillet, Nevada City: All sorts of pears and apples have been dropping because of the black frosts of April 10th and May 11th, which were severe enough to weaken the stems. Still our trees are very full. Hot weather did no damage whatever. Cannot estimate fruit crop of the county, but if it were not for the codlin moth, our pear and apple crops would be more than a good average. The main sufferers from frost were the plums, cherries, peaches, apricots and small fruits. Outside of the codlin moth our mountains are entirely free from insect pests. Winter Nelis pear is the only kind attacked by blight or fungus.

Amador County.

G. L. Lebbs, Ione: Peaches not injured by hot weather, but slightly touched by frost of May 10th, from which some varieties dropped heavily. Peaches dropping within the last two weeks attributed to the cold weather which has prevailed. Cannot estimate fruit crop, but complaint is that it will be much less than was expected. Grapes are damaged about one-half by the frost. Pears and apples have been attacked by fungus, but cannot estimate amount of damage.

San Mateo County.

J. T. Doyle, Menlo Park: My apples, peaches and apricots were thinned before the hot spell, and do not see any injury from heat. Our crop is enormous, but the fruit small. Pears and plums give small crop; peaches and apricots very large; apples about average crop.

Santa Cruz County.

H. C. Morrell, Wrights: Hot weather did no damage. Bartletts are a full crop; Winter Nelis a failure, as usual, from black mildew. Cold north wind caused some Salway peaches to drop,

but other varieties are a full crop. I hear it estimated that the crop of this region will run thus: Plums, one-quarter of a crop; peaches and apricots, full crop; French prunes, full crop; German prunes, a failure; Hungarian prunes, full crop. The codlin moth had appeared in full force. The amount of damage last year was 75 per cent. Peach moth not here yet. Have had the gum blight for last three years, but it is passing off.

A. N. Onymous, Santa Cruz: Hot weather dropped Bartletts in some places, but not in all. No complaint of other fruit dropping. The peach crop is good; plums poor; Petite prunes light for us; pears rather poor; cherries good; olives very promising; codlin moth and black blight on pears and apples are very bad.

T. V. Mathews, Santa Cruz: Fruit crop is very good; 25 per cent better than ever before. We have some codlin moth, but it does little damage. We think it is prevented by night fogs.

San Joaquin County.

W. H. Robinson, Stockton: Hot weather caused too many pears to drop, but did not hurt the peaches. Late cherries were injured. Apples were scorched where the sun struck them, but the injury on the whole is not great. Vineyards somewhat damaged by the frost. Codlin moth larva have appeared, but not as bad as formerly. Peach moth has done slight damage. Blight has attacked Winter Nelis.

W. B. West, Stockton: Hot weather did not injure peach crop here; were not hurt by the frost, but on the Mokelumne river and slightly on the Calaveras, they were injured. Apples are not grown to any extent. Pear trees mostly free from blight.

Fresno County.

W. M. Williams: Heat did not cause pears or peaches to drop; in fact, they are too full now. Fruit crop of the county very heavy, but cannot give estimate.

Tulare County.

Isaac H. Thomas, Visalia: No injury by hot weather to either pears or peaches; in fact, more warm weather would be desirable; fruit 50 per cent better than last year, plums and prunes only being short. Codlin moth very bad last year, and probably the same this year; we are experimenting with numerous remedies. No blight known here.

Kern County.

C. Brower, Bakersfield: No injury either by hot weather or north wind, but small acreage in fruit here as yet. Plums and nectarines on low, wet land, very little crop. Few codlin moth last year, none so far this season.

Santa Barbara County.

J. Sexton, Goleta: The hot weather did not visit this section. Fruit all has to be thinned by hand. Winter Nelis has no fruit, from what cause I do not know. I do not think any fruit will go to waste except apricots; there is a larger crop of them than can be handled. Very little codlin moth here, not enough to do us much damage. We have no peach moth, nor have we heard of any blight or fungus on apple or pear trees.

Ellwood Cooper, Santa Barbara: Hot spell did not reach Santa Barbara. Bartletts in the Goleta district are fruiting abundantly; in fact, all our fruit trees are loaded. We have in some places the black scale and the Icerya. Fruit cannot be grown at a profit anywhere unless the insects are kept at bay.

Geo. W. Coffin, Santa Barbara: Taking 100 as an average standard, I would estimate the fruit crop as follows: Peaches 100, pears 100, apples 90, cherries 80, apricots 125, grapes 100, almonds 25, walnuts 125, figs 100, olives blooming full. I have seen codlin moth in former years, but none so far this year; in fact, it seems to be a bad year for insects generally.

O. N. Cadwell, Carpinteria: Bartlett pears promise very well; Winter Nelis very thin; plums falling off early; peaches looking well, and expect good crop; nectarines full crop; apricot crop very large. No codlin moth in this vicinity; no peach moth.

H. C. Ford, Carpinteria: All fruits are doing well. Apples are above the average; apricots and walnuts one-quarter above the average; peaches, plums and prunes a full crop. Pears in most localities, fair crop.

Ventura County.

N. W. Blanchard: No hot wave in this county. Fruit crop is good all around, and as large as two years ago. There was no frost except in the Ojai valley, and that injured nothing but plums. We have none of the popular pests, and no blights or fungoid diseases.

Los Angeles County.

Milton H. Thomas, Los Angeles: Have had no hot weather to do any damage to the fruit crop, which will be a good average.

S. McKenley, Los Angeles: Fruit crop of county very large and good. Have never seen better prospects for apricots. No damage from heat or frost. Are now marketing tomatoes.

Note by Mr. Lelong.

Samples of apples attacked by codlin moth larvæ were sent to this office by Mr. Gillet of Nevada City. They were small—the largest of the samples was only one inch in diameter and the smallest about one-half inch. Upon being cut, the larvæ that were found in them were nearly full grown, about ready to leave the apple. These samples were laid upon the mantel, and two days afterward it was found that two larvæ had bored out of the side and left the apple.

Several samples of burned fruit were also re-

ceived from various sections, but none to equal those sent by Mr. Robinson of Stockton, the upper side of the apple being badly burned.

From all reports received, I find that where Paris green and arsenites were used the ravages of the codlin moth larvæ are less than any previous season; also where sulphides were used against blights and fungoid diseases, they were less noticed than at any previous time.

Notwithstanding the many obstructions the fruit-growers of this State have had to overcome, they have shown that they can grow the best of fruits and grow them profitably. The healthy condition in which the large majority of the orchards of this State are found, in comparison with former years, is sufficient proof that progress has been made.

The Apricot Discussion.

The report of Mr. Lelong was heard with much interest, and afterward there was a discussion on the apricot, led by Judge Blackwood, of which we will give a report next week.

THE VETERINARIAN.

Colic in Horses.

EDITORS PRESS:—I have read a very interesting communication by Robert J. Dawson, V. S., in the RURAL on "Colic in Horses." It is apparently written with a view to prevent frequent attacks, but I wish to ask if Dr. Dawson will tell us, through your paper, what simple remedy or remedies he would recommend when a horse has an attack. Last year and this, each of my horses had a slight attack I think of colic, when fed freely on the new hay. I gave them about four or five ounces of brandy, diluted one-half, with about a tablespoonful of soda added, and it seemed to give them relief. What would Dr. Dawson prescribe? I think information on the subject would be appreciated by many of your readers.—A SUBSCRIBER, Los Gatos.

EDITORS PRESS:—In answer to "A Subscriber" I will endeavor to give the best treatment for horses suffering from colic or gripes. He is right when he says that my notes upon that subject treated mostly with preventive measures, and I maintain this is the most important matter in all diseases. In the first place, I guess that it is hardly necessary to point out to this gentleman that having clearly proved to his satisfaction that the cause of colic in his horse was due to the consumption of hay in a particular condition, he must discontinue to feed upon this kind of food, and the effect will cease. But in the case of those animals really suffering from pain, there must be two objects borne in mind, viz., to abate or altogether remove the pain by sedatives, and, secondly, to remove the offending material from the intestines by purgatives. As an extremely useful and efficient remedy for the first, I have used for many years the ordinary gum opium (powdered) in one-dram doses, mixed in a pint of warm water.

The dose may be repeated in two hours if relief has not been obtained. If it is a case of ordinary colic, this may be relied upon as a most effectual remedy. This one-dram dose is that for an ordinary sized horse, an animal of the kind and size of those usually worked upon the farm in buggies, etc. Of course, in the case of a small pony, such as a Shetland or Exmoor, half a dram is sufficient. And, on the other hand, a horse as large as some of our city firms employ, I have frequently given, in the course of one day, as much as four drams of opium. Some veterinary authorities say that the objection to opium is that it has a tendency to produce constipation of the bowels. This I will admit, but there is no medical agent which is so good a sedative in the practice of veterinary medicine; and the subsequent administration of a purgative counteracts this constipating effect. In many cases of intense pain from any cause, I have used, with much good effect, the injection of morphia under the skin, by means of a hypodermic syringe made for the purpose. And so quick is this remedy in producing the desired results, that a poor animal may be rolling and throwing itself about in the most intense agony, and one minute after the administration he will be absolutely free from pain and probably commence to eat. The application of blankets, which have been dipped in hot water and afterward wrung nearly dry, to the region of the bowels, is very comfortable and soothing to the suffering animal, and is a thing highly to be recommended. So much for the sedative treatment.

Secondly, if the colic is due to a spasmodic contraction of the bowels, produced by drinking while much heated of very cold water, the above-mentioned administration of opium, etc., is all that is needed; but if the attack is produced by the animal having eaten indigestible or unsuitable food, it is clearly evident that this material must be removed from the intestines by purgatives. For an ordinary-sized horse six drams of the best Barbadoes aloes should be given, mixed with one dram of Jamaica ginger, which will prevent griping; but it is necessary to remember in giving purgative medicine to horses that some horses, like some people, are very much more easily purged than others, and the administrator of veterinary medicine must remember this, as if he gives too strong a dose of laxatives the horse may die from super purgation. And this is an ailment—this diarrhea in horses—which is very difficult to stop, so that if the owner feels that he is not sufficiently acquainted with the individual peculiarity of the horse in question, he had better resort to giving bran mashes in large

quantities daily. This will have the effect of producing a loose discharge from the intestines, which can be regulated by means of lessening or increasing the quantity of bran. Linseed oil in this disease is also a safe medicine, given to the amount of one pint, and if a desired effect is not produced in 24 hours another half-pint may be given. I may state, in passing, that it takes 24 hours always in the horse to produce purgation.

There are a great many things in comparative pathology which are interesting, and speaking of colic in horses, I have often noticed that the animal is much more liable to an attack after extraordinary exertion, or when he has used up a great deal of vitality. It has been thought, but not proved, that new hay will at a certain period, when the chemical changes are taking place, the conversion into sugar, and so on, produce colic. Personally, I question this, and am much more inclined to think that the pain is produced by eating too much of this agreeable food, thereby over-distending the stomach, and the digestive system not being able to get rid of it, the ingesta undergoes fermentation and produces what is known as "flatulency," or windy colic. And in this disease the brandy and carbonate of soda, which "A Subscriber" gave, was rational treatment, and likely to do some good; the carbonate of soda neutralizing the generated gases and chemically converting them into liquids, which, taking less room in the intestines, does away with over-distention, and consequent pain. ROBERT J. DAWSON, 225 Geary St., S. F. Veterinary Surgeon.

POULTRY YARD.

A Born Orphan.

I am a lone, unfledged chick
Of artificial hatching;
A pilgrim in a desert wild,
By happier mothered chicks reviled,
From all relationships exiled,
To do my own lone scratching.

Fair Science smiled upon my birth
One raw and gusty morning;
And now the sounds of barnyard mirth
To lonely me have little worth;
I am alone in all the earth—
An orphan without burning.

Seek I my mother? I would find
A heartless personator;
A thing brass-hided, man designed,
With steampipe arteries interlined
And pulseless cotton-bating lined—
A patent incubator.

It wearies me to think, you see—
Death would be better, rather—
Should children e'er be born to me,
By fate's most pitiless decree
My little ones, alas, would be
With never a grandmother.

And when to earth I bid adieu,
To seek a greater,
I will not do as others do,
Who go to join the ancestral crew,
For I will just be gathered to
My incubator.

—Burdette, in Brooklyn Eagle.

Automatic Poultry-Feeders.

There has been something done in the way of automatic chicken-feeders, but the following from a correspondent of the *Calistogian* will be read with interest: A few days ago I saw an old lady emerge from a barn with a quantity of wheat in her apron, and heard her cry "chick, chick, chick," while she scattered the grains broadcast on the ground. I suppose that old lady has done the same thing day after day for years, and will continue to do so to the end of the chapter, if inventive genius does not come to her aid. As I watched the antediluvian process of feeding chickens, I wondered why the men who invented such labor-saving machines as egg-beaters, apple-parers, sewing-machines, etc., never thought of automatic, or some other matic, chicken-feeders. I have an idea borrowed from a pheasant preserve in Great Britain which may serve to put some practical mechanic in our district in the way of making a cheap and useful contrivance. In the preserve above mentioned, pheasants are fed with maize during the winter months, and I assure you a game-keeper would have a big job on his hands were he to feed all his birds by hand. Besides, were he to scatter it on the ground, all the birds of the forest would come in for a share. The difficulty is overcome by placing boxes in convenient localities and training the birds to come to them. The feeder is simply a box with a lid and a hole perforated low down on one side. Over the hole is a piece of board which swings on a pivot and opens or closes the aperture. On the side of the pivot away from the hole there is a step or a perch for a bird. When a pheasant lights on this perch, the maize runs out into a cup fastened to the side of the box. As soon as the bird flies away the lever falls back and covers the hole. The leverage is so arranged that birds lighter than pheasants fail to open the source of supply, and so the little sparrows, robins and wrens go on short rations. Could not old cracker-boxes with dented pieces of tin be manufactured into similar feed-boxes, and thus lessen the work of human chicken-tenders? It would be necessary to fill the boxes only once a week or month, according to the capacity of the box or the chickens.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

From the Veteran in Kansas.

We are gratified to hear again from Bro. T. A. Thompson, the pioneer Patron whose letter in the PRESS of April 9th many readers will recollect with pleasure, and we doubt not they will thank us for giving them the opportunity to read most of his latest missive and welcome him anon to the Grange homes and halls of California:

LAWRENCE, KANSAS, June 25, 1887.

Dear Sir and Brother: It is very gratifying to the early laborers in the Order to realize that it has outlived the opposition all new movements encounter and the mistakes of those who sought only pecuniary gain and never grasped the high and noble purpose to educate the farmers and bring them into association for social and intellectual development, and that it is firmly and securely established and destined to go on parallel with similar but older institutions, bringing to the farmers benefits little anticipated at first. Thousands who have stood aloof from the Order are now satisfied of its permanency and utility, and come flocking to its support.

I believe the Order is doing more good now than ever before. It commands the respect of all classes, and is enjoying a healthy and substantial growth. Very ignorant and dull must be that farmer who does not realize the necessity of organization by his class. The demand was never more pressing than now. Every other class and interest is organized, and only through organization can they expect to secure and enjoy their rights. I wish every farmer would ask himself, what is the tendency of the times, and whither are we drifting? and what has the Grange accomplished? and then seek to answer from an intelligent standpoint. An investigation of the facts will show the Grange came none too soon, and involves the welfare of the farmers, and, through their prosperity, the welfare of the whole people.

I am not located where I can enjoy any Grange privileges, there being no Grange in this vicinity, but Johnson county, adjoining this, is well organized, and the Patrons there have realized more from the Order than in any other county I am acquainted with. They have only demonstrated what the Order is capable of doing for a people. They have a bank and co-operative store, do their own business and mind their own business; have fine halls, and discuss questions relating to their interests, and advance in social and intellectual enjoyment.

I note with pleasure the reports of picnics and Grange meetings in the PRESS and the Patron. While you have many live and strong Granges, yet in California, as elsewhere, the Order is not so strong as it should be. Farmers think they cannot spend time to go to the Grange when it can be made the most profitable as well as the pleasantest time of the month. Farmers work too much and think too little; or rather, read and think and interchange ideas too little. As the Grange was designed, it is proving to be the greatest educator the farmers have ever enjoyed.

It has been my purpose to visit the Pacific Coast at as early a day as possible. This desire has been strengthened as I have become more familiar with the facts through the RURAL PRESS and California Patron, and documents sent by various friends. I have not been able yet to effect a sale of interests in Dakota and Minnesota. Before settling I wish to see various localities and visit many Granges, so as to be able to decide intelligently where I would like to make my home. To this end I now think of obtaining a ticket good for six months, and spending next winter in your State.

It has been my good fortune to enjoy a large observation of the practical workings of the Order; and if I mingle with the Patrons of California, I hope to give them such information as will encourage them to take renewed interest in the Order, and assist in strengthening the Granges; and where I can reach the public ear, aid in removing prejudice and indifference and awaken an interest in the Order, thereby increasing the membership.

Yours fraternally,
T. A. THOMPSON.

A New Grange in Placer.

Eureka Grange, P. of H., was organized June 18th, at the Columbia schoolhouse, five miles from Auburn, by State Deputy Overhiser. Bro. Flint, State Lecturer, was also present and lent valuable aid. This new organization, which starts with over 20 charter members, is largely due to the earnest efforts of Bro. V. W. Still, W. M. of Magnolia Grange. The officers are as follows: C. L. Corwin, M.; E. W. Striplin, O.; Mrs. R. C. Lewis, L.; J. C. Burns, S.; R. S. Futhy, A. S.; Mrs. L. Site, C.; Mrs. L. Site, T.; Annette Futhy, Sec.; E. E. Hulbert, G. K.; Elizabeth Hulbert, P.; Dora E. Burns, F.; Mrs. Burns, Ceres; Etta Hulbert, L. A. S.

POINT OF TIMBER GRANGE now counts over 40 members and expects to confer the fourth degree on a big class the 16th inst.

Interstate Commerce—Resolutions of Walnut Creek Grange.

The following preamble and resolutions, adopted at the last regular meeting of Walnut Creek Grange, were published in the Martinez Daily Item of June 25th:

WHEREAS, The Interstate Commerce Law, passed by the last Congress, has called forth much opposition and statements pro and con in regard to railroads; and

Whereas, The railroad companies, in our opinion, are seeking by odious and unwarranted constructions under said law to secure its modification and repeal in the interest of monopoly and favoritism and discriminations between persons and places; and

Whereas, We regard it as proper that we should express our opinion upon such vital questions; therefore,

Resolved, First—That railroad companies were not, in our opinion, chartered with the right of eminent domain and other rights which they enjoy, or organized, or permitted, for the sole purpose of making all the money possible for their promoters or shareholders; that the object of their creation was not to create any favored classes of people or particularly profitable business, but that the object of their creation was primarily the convenience and benefit of the public generally, and secondarily only, and incidentally only, the reasonable profit of the promoters and shareholders.

Second—That such and all other corporations authorized by law to administer a public trust, or

Grange Tracts.

Our National Lecturer, among other missionary work this year, is sending out various printed circulars, leaflets and slips to workers in the Order. Many of these campaign tracts are of a size convenient to slip into a common letter-envelope. Here, for example, is the body of one of the more recent—No. 11:

J. H. Brigham, Master of the Ohio State Grange, closed an address to the Patrons of that State with these words:

Let our watchword be, "Put none but honest, capable, sober, economical men in official positions." Let us demand a fair share of representation in the Legislature and Congress for the men who are directly interested in the nation's greatest industry. In a representative Government, the interests not directly represented always have and always will suffer. No one but a fool or knave will deny this. Shall past follies be repeated and continued? Shall we not act upon the theory that the "Lord helps those who help themselves"? There is no shadow of excuse for us. We can protect our every interest, and if we are not manly enough to do it then we deserve to suffer. If we are determined to give more attention to our own interests in the future, the first step must be to organize our forces. It is not probable that a political or party organization of farmers is desirable, but an organization which is not afraid of politics we must have. The Grange has its social, educational and moral features, but that is not all. We propose to boldly advocate political reforms, and co-operate for the overthrow of the "pirates."

THE BELLMAN INFORMED OF THE DECLARATION OF INDEPENDENCE.

use, or business, should at all times be subject to control by the public, and that any other theory or construction inevitably leads to the creation of favored classes, which we regard as inimical and destructive of republican institutions, and the rights and privileges of republican citizens, and at variance with and destructive of our form of republican government.

Third—That we recognize that the questions of proper control of such organizations are complicated and not easy of solution and require the calm and thoughtful consideration of our best talent; but that general rules prohibiting discrimination between persons and places and prohibiting excessive charges and prohibiting a higher charge for a short haul than a long haul, of which the short haul is a part, as embodied in the Interstate Commerce Act, are eminently just and should be the basis of all regulation.

Fourth—That the railroad companies should not be permitted to carry freights at nominal rates in order to build up business for themselves to the injury of local manufacturers or interests; that the people do not exist for the benefit of the railroads, but that the railroads exist for the benefit of the people.

Fifth—That the experience gathered after a few years of trial and strict enforcement of the said law will the better enable the Commission provided and Congress to apply proper remedies.

Sixth—That for these reasons we favor the strict enforcement of the said Interstate Commerce law for at least a sufficient number of years to allow business interests to adjust themselves thereto, and that we deprecate any attempt to change or alter said law until a sufficient number of years have elapsed to demonstrate whether the evils claimed to be consequent thereto are real, or mainly due to opposition to lawful control by the railroad companies.

STOCKTON GRANGE thinks the Interstate Commerce law should have a fair trial and has requested Congressman Biggs to use his best endeavors to that end.

who infest and sometimes control political parties. Farmers, join us in this work, and we will do you good, and hurt no man who is doing an honest, legitimate business.

The smaller ones usually end thus: "Read this, then hand it to your farmer neighbor, or fold it in the next letter you write. For further information about the Grange, address Mortimer Whitehead, Lecturer National Grange, Middlebury, New Jersey."

Bro. Whitehead invites Patrons to keep this kind of ammunition at hand, when writing letters or sending papers to friends or foes, and slip them in, and so keep them moving "for the good of our Order, our country and mankind." He also suggests that local papers might be willing to reprint some of them, as matter of interest. These suggestions are all worthy of consideration.

Grange Interests in Sonoma.

EDITORS PRESS:—Pomona Grange meets in Santa Rosa Grange hall the third Wednesday in July. Beside the usual business there will be a choice program of oratorical, rhetorical, musical, and elocutionary selections. A big attendance of Patrons is expected. All fourth degree members are welcome.

Santa Rosa Grange is growing. A class of four was elected at the last meeting. The visit of Worthy State Lecturer Daniel Flint was of great benefit. He made friends for himself and for the Order. Daniel Flint is the right man in the right place. But he will discharge the duties of any place with honor to himself, his friends and the position. As W. M. of the California State Grange, he amply

won the commendation, "Well done, good and faithful servant."

Santa Rosa Grange has just taken in five members by affiliation and one by initiation. There are also a number of applications for membership. The several committees appointed to make arrangements for the accommodation and entertainment of members of the State Grange are busily at work. There is no doubt of a large attendance at the October meeting of the State Grange. All who can should attend, for Santa Rosa is a splendid town, and a cordial welcome will be extended all visitors. D.

THE Patriotic Order Sons of America held their Eleventh National Convention in Chicago last week. The revised platform declares against permitting any foreign Socialists, Anarchists, or Nihilists to land at our ports, and would forbid foreign speculators and adventurers investing in American real estate.

THE Arcata Grangers' picnic at Dow's Prairie is said by the Union to have been an unusually happy occasion for all who participated.

Ring the Liberty Bell.

As near as we can remember, it was a hot and sultry summer day of 1776, that Thomas Jefferson gave a piece of his mind to the old folks across the water, in an essay or indictment called the Declaration of Independence. It was very handsomely done, and in substance says that the United Colonies had saved up money enough to set up housekeeping for themselves. On or about the 4th of July, 1776, this document was signed by Benjamin Franklin, John Hancock, et al., as plaintiffs in a case about to be tried in the Court of Mars. It is a very readable document and should be read once a year.

Suffice it to say that early in the morning of that memorable day everybody felt sure something startling was about to happen. Groups of excited men could be seen on the street or rushing toward the State house. Congress was talking over the great divorce question; the hour for the decree was approaching. The old bellman mounted to the belfry to be ready to proclaim the joyful news. The bell had been cast in England with this prophetic sentence around its rim: "Proclaim liberty throughout all the land unto all the inhabitants thereof." At length, at 2 o'clock the door of the hall opened and a voice exclaimed: "It has passed." Like lightning the words leaped from lip to lip and the building shook with huzzas. The boy at the foot of the ladder shouted to the old man in the belfry: "Ring, ring!" The first clang started every heart in Philadelphia like a bugle blast. "Clang, clang!" it sounded on; the echoes floated on the air to Boston, to New York, all over the land, blending with the boom of cannon, martial music and the shouts of a rejoicing people. The sound of that bell was borne on the breeze across the sea, and there is a tradition that old Lord North fainted, parliament cried like a child, and the whole island felt as solemn as a graveyard.

AGRICULTURAL NOTES.

CALIFORNIA.

Butte.

CHERRIES.—Oroville Register, June 23: Mr. A. B. Knepper has sent us a box of very fine Bigarreau cherries, grown at Forbestown, on red land without one drop of water, except what nature provided, or any fertilizers whatever. The altitude is 3000 feet above the sea level. The cherries were extremely large, of brilliant color and of fine flavor. The cherry grows very large and fine in Oroville, and, as Forbestown is 26 miles distant, the whole foothill slope of 26 miles, and up to the altitude named, is a favorable region for cherries.

Fresno.

WHEAT.—Republican, June 24: Reports from various portions of the county indicate that wheat is turning out considerably better than expected. Summer-fallow is giving a first-class yield, and nearly all the early sown wheat is making a fair crop. Most of the wheat is first quality and will rank No. 1 in the market. Farmers tell us that they will make more on their crop this year than they did last. The average yield will not be so heavy, but the higher prices will more than make up the difference.

APRICOTS FOR PROFIT.—J. H. Harding has a 10-acre apricot orchard in Washington colony, of the Royal, Peach and Moorpark varieties, and is now engaged in picking and curing the first-named variety. His trees were set out three years ago last February, and bore a fair crop last season. He is now taking an average of 115 pounds of fruit from each tree, and there are 108 trees to the acre. This fruit will sell on the tree for one cent per pound, the packers doing their own picking. The yield of 1080 trees will be 124,200 pounds, worth \$1242 on the trees. Mr. Harding proposes to do his own drying, however, and reap the profits of that labor. His fruit when dried will weigh about 20,000 pounds. First-class sun-dried apricots sell readily at from 12½ to 15 cents per pound, so that he expects to realize from \$1200 to \$1600 for picking and drying, which he will do with little help outside of his own family.

San Diego.

HONEY.—San Jacinto Register, June 23: P. Bell reports the honey product light. The quality is not so good as last year on account

of the lateness of the flowers. He has obtained four tons of honey this year. He had more than double this amount last season.... H. T. Hallock states that his bees have made two cards of honey weighing $9\frac{1}{2}$ pounds each, and two cards weighing 8 pounds each.

HORTICULTURAL MEETING.—The regular monthly meeting of the San Diego County Horticultural Society will be held at Poway, July 6th. A cordial invitation is extended to all, with comfortable lodgings and plenty to eat.

Los Angeles.

WESTMINSTER PRODUCTS.—"R. S." in Los Angeles Times of June 23: Everybody is busy with the hay crop; stacks line the roads. The apricot crop is very good, and is now ready for market. Our crop is the best in this whole section, and will probably all be sold for consumption in the surrounding towns. The early Moorpark is the best apricot now known to us, combining earliness, large size, beauty and fine flavor. These were fully ripe here June 14th. The peach and apple crops are very promising, and the Anderson peach has now a fine color and will soon be in the market. The potato crop is large.... Jas. A. McFadden has furnished the Anaheim *New Era* with the following statement of produce grown and shipped from Westminster township during the past year: 22,000 sacks corn, 2,640,000 pounds (110 cars); 5000 sacks potatoes, 500,000 pounds, (25 cars); 7000 sacks barley, 700,000 pounds (35 cars); 3000 tons hay, 6,000,000 pounds (300 cars); 3840 cases eggs, 230,400 pounds (12 cars); 288 coops fowls, 40,320 pounds (2 cars); 18,000 rolls butter, 36,000 pounds (2 cars); merchandise received at stores, regular freight rates, 275,800 pounds (14 cars); carload rates, 120,000 pounds (6 cars). The preceding does not include stock raised or sold.

Mendocino.

WOOL-DAY AT UKIAH.—*Dispatch and Democrat*, June 24: The streets presented a most animated appearance last Saturday, and wool-buyers from the city, as well as the home buyers, were busy examining the many loads of wool that the growers had brought in to sell. The Mendocino spring clip proved one of the best ever put upon the market, and our wool-growers reaped their reward. Nearly all the sales were made in the afternoon, and within two hours' time, amounting to some 600 bales, or 180,000 pounds, and sold at from 22 $\frac{1}{2}$ to 23 $\frac{1}{2}$ cents. Humboldt and Mendocino wool always commands the best prices going for the Pacific Coast product.

Sacramento.

EAST-BOUND FRUIT.—*Record-Union*, June 28: Five carloads of fruit went East last evening by the express train, which had to be run in two sections. Two carloads were from Sacramento, one from Vacaville and two from Newcastle. The shipments of full carloads of fruit to New York by passenger train are much more extensive this year than heretofore.

San Joaquin.

WATERMELONS.—*Lodi Sentinel*, June 25: On account of the cool weather during May, watermelons in this, as in all other portions of the State, will be two weeks later this season than last. Indications point to a good crop.

Santa Cruz.

A NEW BERRY.—*Pajaronian*, June 23: Judge J. H. Logan has produced a new small fruit by grafting raspberry on blackberry stock. It is as large as a blackberry, but more of the color of the raspberry. It is firm and should be a good shipper. The flavor of both berries is blended, while it is similar to the raspberry in odor.

Sonoma.

THE NEW CANNERY.—*Santa Rosa Democrat*, June 25: Between 20 and 30 carpenters and laborers are hard at work to finish the new cannery on Sixth street next week. The building is of brick, 120x80 feet, commodious, well lighted and ventilated, and capable of accommodating 600 hands during the busy season. The floor is composed of 2000 pieces of 2x6 timber, aggregating 20,000 feet. The walls are about 12 feet in height, from which the roof ascends at an easy incline to the peak, which is fully 40 feet from the ground. A 30-foot well has been sunk, and a 35 foot windmill and 6000-gallon tank are to be erected. The warehouse is filled to the roof with 40,000 cans and well stocked with box material, upon which the box makers will commence work next week. Three hundred tons of fruit have been contracted for already, and Mr. Perry states that about 1,000,000 cans will be put up during the season.

Siskiyou.

SCOTT VALLEY NOTES.—*Cor. Examiner*, June 21: All danger of June frosts has passed. The late rains have insured the wheat crop, which promises to be of an excellent quality, while other grains and hay look well. Hundreds of acres of the foothills have been sown to alfalfa, and in many instances will yield from one to four tons of hay to the acre. An irrigating ditch leading down the eastern side of the valley is one of the enterprises projected.

Tulare.

MAIZE, MELONS AND BLACK CAPS.—*Visalia Times*, June 23: The first watermelons of the season were brought to this city yesterday by B. C. Anderson, from his ranch four miles east of town. He also brought in a few sample boxes of the Black-Cap raspberries, which were very fine.... The residents of Lime Kiln have been feasting on green corn and watermelons for the last 10 days. Lime Kiln is in

the thermal belt of the Sierra Nevada, and this early production of green corn and melons shows what an opportunity there is for supplying the whole country from here to El Paso with early vegetables, were our mountain ranchers disposed to turn their attention and industry in that direction.

Stanislaus.

USING STRIPPERS.—*Modesto News*, June 24: The farmers who have small tracts of land in the hills east of Oakdale are cutting their grain this year with strippers, which are giving the best of success. The cost of this machine is about \$400, and can be worked with four horses and two men, and cuts eight feet.

Yolo.

A FINE APRICOT.—*Woodland Mail*, June 25: G. D. Fiske yesterday placed on our table one of the finest clusters of apricots we have yet seen. This fruit is of the Routier variety and was grown on the premises of W. Coleman, near town, on trees only three years old. The apricots are large and of a delicious flavor. There were about a dozen on the branch, which was not over six inches in length.

RAISIN PRODUCT.—*Davisville Cor. Democrat*: I am informed that the Briggs family will place upon the Eastern market 100,000 boxes of raisins, besides some 50,000 in the hands of friends,

of April. Grain of all kinds is making a very rank growth, and old settlers say that it will be so late in the season before it ripens that there will be some danger of its being frosted. Should the weather be dry, however, from now until the 1st of August, there will probably be the largest yield per acre ever grown in this upper country. There is some old wheat yet in producers' hands, and some of it two years old. The farmers have been keeping it in hopes of getting a better price after awhile; and now that the railroad is completed over the Cascade mountains, those who have grain are in high glee, thinking they will soon have a chance to ship to the California market. If the commission merchants and wheat buyers of San Francisco would arrange for receiving and handling grain at Tacoma so farmers could ship directly to them, they could secure the largest portion of the crop in this region. Wheat is now selling at 58 cents per bushel.—*G. F., Spangle, W. T., June 20th.*

Sonoma County Notes.

EDITORS PRESS:—That busiest of all seasons, the harvest, is now at hand; and consequently an ordinary farmer correspondent can hardly find time for newspaper work. This explains

how much damage may yet come to his vineyard in the next 60 days.

That portion of our farmers who are engaged in the sheep business here did well this season. Sonoma wool always finds a ready sale at tip-top prices. We know of farmers who have sold their spring clip in home market this year for 23 $\frac{1}{2}$ cents per pound. What do you think of that?

If one can believe half he hears, there will be many miles of rail laid in this county within a year. No one seems to doubt the construction of the road from Santa Rosa to Benicia. It will be a paying line and ought by all means to be built. Then the new road from Santa Rosa to Green valley via Sebastopol seems sure of construction. That also will be a paying line. It will tap one of the best and most prolific fruit sections of California. Then again, the S. F. & N. P. R. R., or Donahue line, will probably be extended from Oloverdale, the present terminus, to Ukiah, the thriving county seat of Mendocino county. This road would tap an immense timber section, as well as the fertile Russian river valley. All of these roads ought to be built. Let it be so, is our prayer.

The fruit crop is very large, but will all be cared for. At Petaluma there is an immense cannery; a large one also at Healdsburg, and the largest of all at Santa Rosa. Then there are fruit-driers at Sebastopol, Healdsburg and Santa Rosa, and beside many farmers have their own driers. Peaches and Bartlett pears are being contracted at \$30 and \$35 per ton. This seems to us a paying price for the producer.

Corn never promised a better yield. In short, everything in this grand old county is booming on a safe yet paying basis. We have no land boom, and do not want one. All we want is a steady growth, and that we have, and are sure to keep on having.

Lumbermen are busy making both lumber and money.

Dairymen talk of a short season, but say they have done fairly well.

Grangers growl, yet they ought to be the happiest people on earth.

State Grange season fast approaches. Santa Rosa expects a large crowd the first week in October. All who attend may expect a good time.

Next in order is the Fourth of July, and after that comes plenty of hard work. Here's to the Fourth and to the work!

OCCASIONAL.

Santa Rosa, June 28, 1887.

Mollie Pitcher.

The battle of Monmouth was fought on the 28th of June, 1778. It was on the Sabbath and the hottest day in the year. It was stubbornly contested, and may be regarded as a drawn battle. It was during this battle that an Irishman by the name of Pitcher, while serving his gun, was shot down. His wife, named Molly, only 22 years of age, employed herself, while he loaded and fired his piece, in bringing water from a spring near by for the thirsty soldiers. While returning with a supply, she saw him fall and heard the officer in command order the gun to the rear. She immediately ran forward, seized the rammer, declaring she would avenge his death. She fought her piece like a hero to the last. The next morning, Gen. Greene, who had been struck with her bravery, presented her to Washington, who immediately promoted her to a sergeant, and afterward had her name put on the half-pay list for life. Previous to this she fired the last gun when the Americans were driven from Fort Montgomery. Gentle Mollie was a fair specimen of our fore-mothers, whose amiable daughters now declare that taxation without representation is a wrong and an outrage that must be righted or there will be another rumpus in the land.

The Fourth of July.

After John Adams had signed the Declaration of Independence he wrote to his wife the following prophetic words concerning the Fourth of July:

It will be the most memorable day in the history of America. I am apt to believe that it will be celebrated by succeeding generations as the great anniversary festival. It ought to be commemorated as the day of deliverance by solemn acts of devotion to God Almighty. It ought to be celebrated with pomp and parade, with shows, games, sports, guns, bells, bonfires, and illuminations from one end of this continent to the other, from this time forward, forever more.

A MONUMENT TO STARR KING.—The Unitarian church in this city, built during the ministry of Thomas Starr King, has lately been sold and will soon be torn down. The remains of the mighty, brilliant, patriot-preacher will be taken up and laid elsewhere. This has again brought up, in grateful remembrance and admiration, his inestimable service to the State at the time of the war for the preservation of our national oneness, and a strong movement is well afoot to have a fitting monument erected in Golden Gate park in memory of the man who confessedly did more than any other to keep California loyal to the Stars and Stripes, and who gave his life for the cause of Liberty and Union as truly as did those who fell on southern battle-fields.

MOLL PITCHER AT MONMOUTH.

which they can contract. This is about one-sixth of the entire product of the State, and will justify their intention of entering the market independent of the middleman.

Yuba.

A FLOWING WELL.—*Marysville Appeal*, June 24: W. F. Lavy, whose place is about 10 miles south of this city, on the Sacramento road, says: "Four years ago I started boring a pump-well in one of my grazing fields. Imagine my surprise when at a depth of 30 feet a stream of water came out about one foot in the air. For six months of each of the past four years, that well has watered all my stock; and by digging deeper I could undoubtedly have secured a perpetual flow. In 1864, on the Eberhard ranch, I assisted in boring an artesian well which has made the large-sized pond now on the place, and which receives its life from that well. No, the surrounding country does not need irrigation—Dry creek runs through so much of it."

HARVEST HELP SCARCE.—*Wheatland Graphic*, June 25: On Wednesday and Thursday \$2.50 a day and board was offered, but every available man in town was at work or had been engaged. In consequence of the scarcity of local help, workmen had to be procured from Marysville and Sacramento, and then were hard to get.

WASHINGTON TERRITORY.

EDITORS PRESS:—More rain has fallen throughout the Palouse country during the month of June than has been known before for many years, and the ground is as thoroughly soaked as it is in ordinary seasons on the 1st

why "old Sonoma" has not been heard from lately.

The hot spell hit us here, but did very little serious damage. Wheat may be a trifle shrunken in consequence, but the yield will be remarkably large. There has not been such a crop of grain in this county for the past 10 years as will be harvested this summer. Already the self-raking reaper, the improved header, and the twine-binding harvester are to be seen in scores of grain-fields. Threshing has not commenced yet, but the machines are being put in order for that work, and soon the shrill whistle of the steam-threshing engine will be heard at early dawn, at noon-time and at dusk.

The hop crop of Sonoma is one of its staples, and brings many thousands of dollars to the tillers of the soil. So far the outlook for an abundant yield of hops is very encouraging, and the promise for price is not at all discouraging. Report hereabout says that certain dealers have offered to engage the coming crop at 20 cents per pound. That means \$400 per ton, which is a paying business.

In the vineyards there is every reason to expect a fair return of grapes. True, the late frosts did some damage, but the new acreage will more than offset the harm done by frost. Therefore, at the present writing, it seems the vintage of 1887 will be as large as that of 1886. That being the case, the outlook for price is not very encouraging, for wine-makers realized little profit last year, and they do not seem at all anxious about buying grapes, especially at fancy prices. However, there is yet abundant time for the grape crop to be materially damaged. The long, hot days of July and August are very trying, and no one knows

A Pioneer's Romance.

A Fourth of July Before the War.

[Written for the RURAL PRESS by M. B. D.]

Tom Raymond's proud turnout went glittering through the streets of Merrimac. The new buggy literally gleamed in the afternoon sunshine, and the pair of spanking bays were glossy as satin.

"The whole thing looks as though 'twas greased," said one newsboy to another as the equipage passed them.

It whirled on to the station, met the train, and soon came back; and now the vacant seat beside Mr. Raymond was occupied by a handsome girl. No stranger was she to the many they met, and who recognized her with a glance of surprise. Only a year ago she had left for her last term at Northampton, a slip of a girl, with the gentlest manners and a wild rose face that made her a general favorite. But what a change! She had returned not only with her graduating honors, but with a beauty and air of fashion that was evident even from the glance obtained of her in passing. Her cheeks glowed and her eyes sparkled through her fluttering veil, while she smiled and nodded to her old friends with conscious delight at seeing them. Yet there was a young man unrecognized, and he felt that one of those gay little nods to him would be a treasure, as he gazed with open admiration at this meteor which was soon out of sight, gliding on down the elm-shaded avenue.

This young man was Oliver Lloyd, the rich pioneer from California; for this was in the year 1861, when the pioneers of the Pacific Coast were young men, the most venturesome and the strongest of the country, who sought fame and fortune where those less vigorous and bold would hardly have dared to penetrate. Not a month ago his arrival in Merrimac had occasioned a ripple of excitement, especially among the young people, and immediately the girls had curled their tresses with more studied art, while their admirers were resolved on keeping their favor in spite of this dangerous lion, who was supposed to be a competitor for it. His first appearance was at a party given by Mrs. Elco, a leader in society. On the appointed evening her large triple parlors were ablaze with light, which glittered in the depths of broad mirrors over the fretwork of the gilded cornices and costly pictures.

Her nieces, Maud and Ina Hurley, were indeed striking figures among the bevy of bright and youthful ladies about them. They did their best to attract the particular attention of the new lion, and so did Miss Vincent, an acknowledged belle, whose dark eyes beamed bewitchingly over the plumes of her snowy fan; but all this array of beauty was in vain for him.

Nevertheless he was very genial and popular, and he attended their parties and picnics with a constancy and evident enjoyment that was gratifying to his entertainers. And yet there were shadows about his keen gray eyes, and, at times, a melancholy expression upon his rather strong and haughty features, that made him still more interesting to those who were either sentimental or sympathetic than he was to the light hearts of vanity. He might sometimes be seen at dusk upon a lonely ramble, and Miss Miller, a kindly old maid, declared that his sadness must be owing to some heartache. She was a music-teacher, and being out upon her errands of instruction, often met him. He frequently walked to the cemetery, and once she followed him out of curiosity, but was rewarded only by seeing him rest by his mother's grave. The dusk had nearly merged into night, when he started to return, and perceiving her, joined company and walked on to the village. To him her quaint humor and innocent gossip was amusing, and when he met her by chance he was not averse to listening to it. Along the avenue they proceeded until they had passed the more thickly settled portion of the town and found themselves again beyond the suburbs. Half a mile further on still, Miss Miller paused before a large, deep garden that nearly concealed the farmhouse it enclosed.

"I am going in to see Miss Belmont. You know she only returned this evening from her finishing term at school, and she will have lots of news and plans to tell of."

"May I have the pleasure of joining you?"

"Not for the world would I give you such trouble. I shall return quite late, perhaps, and my nephew will see me home."

Mr. Lloyd had been on the point of asking for an introduction to the little graduate, but, from the manner in which she interrupted him, was not quite certain that this would be agreeable to her. His surmise was well founded. Tom Raymond was her favorite nephew, and she strove to promote his wishes in regard to Miss Belmont, since, like others, he too had been charmed with her sweetness and beauty.

As Mr. Lloyd wandered on, the fragrance of roses and mignonette grew faint and was lost in the light air that blew from a grove in the west, where the sunset was dying in a glow which grew brilliant as carmine against the horizon. Taking a footpath, he began to penetrate the deepening shades of these groves, but before he had wandered far he reached a sheet of pure spring water, which was almost a lake. How its glassy face glimmered like a fire opal in the sunset light. Blushing lilies starred its margins, and tall reeds and bushes leaned over its marshy banks. A tiny boat was moored to a small sapling. The oars were secured inside, and, casting off the painter, he leaped into the light bark. He reached the middle of this fairy lake, then explored the shores, and finally found the outlet, a silvery stream that seemed to lose itself in the vistas of the wood. Following its course, at length he saw its ripples grow diamond-pointed by the moonbeams that fell through the opening above and between the trees.

"What a glorious place for a moonlight stroll!" thought he, pausing to enjoy the view; "but it is a trifle lonely," and a thought of the farmer's daughter in the farmhouse yonder came to his mind.

As if in response to the fancy, he saw a lady whose white dress was clearly outlined against the dark foliage behind her. A wealth of sunny curls fell down over her shoulders and reached to her waist in rich profusion, while a fleecy scarf covered her head and encircled her delicate face, now beaming with pleasure. At first she seemed alone, but presently he heard her merry voice and laugh as a tall man came from some rosebushes, with his hands full of fresh damask roses which he had just gathered for her. She took them with the eagerness of a child, and inhaled their dewy fragrance as joyously.

Mr. Lloyd frowned, thinking, "Here comes the lover—a fine old fellow, too; but I'll cut him out if mortal man can do it." He had passed the confines of the garden, and now, becoming aware of his trespass, hastened to leave it.

"I had better take you in out of this damp, Maggie," he heard the gentleman remark while he silently plied his oars.

"Oh! no, papa. I have not been so happy this summer as I am to-night. It must be lovely down by the pond; let us go."

Mr. Lloyd unconsciously listened for his reply, but could not catch it above the babbling of the brook. Then he hastened away. The quivering path of silver over which he floated seemed winding to the land of enchantment. He had recognized the girl whom he had seen in the fine equipage during the afternoon, and her moonlight walk disclosed to him her filial love and fondness for home, which he thought adorable traits of character.

On regaining the road he walked with rapid steps, and as he passed the farmhouse snapped from its stem a half-blown rosebud that leaned over the garden wall and fastened it in his buttonhole.

His resolution to win Miss Belmont he found difficult of accomplishment. At church, at parties, and in her own home, to which he soon gained admittance, he often met her; but she seemed as indifferent to him as she did to others who were just as anxious to gain her favor, and Mr. Raymond was not an exception, although he was a most formidable rival. She sometimes drove out with him in his fine carriage, and this Mr. Lloyd beheld with jealous pangs and renewed determination to carry out his resolve. He saw them on the morning of the Fourth of July speeding down the avenue just after the parade of the firemen and several societies that had turned out to celebrate the occasion.

This year the exercises were particularly interesting, since the breaking out of the war had aroused the patriotic spirit among them to the pitch of enthusiasm. Crowds of spectators were still watching the uniformed townsmen and listening to the strains of martial music which rang upon the sultry air, when the carriage passed him, and now he received a gay little nod from Miss Belmont, but not with the gratification he had once imagined such notice would give him. He was quite disturbed, but sauntered on, trying to devise some plan of making the evening particularly pleasant to her.

There was not to be any public display of fireworks, since the moon was full and would detract from its success. A public ball was to be given, but this she declined to attend.

Miss Miller looked from her high dormer window just as he turned a corner, and he caught sight of her sharp face, which expressed unusual satisfaction, for she too had seen the company her nephew had secured. Like a flash a plan came to his mind, and the idea that she would make a good assistant occurred to him; so shortly he found himself in her stiff little reception-room unfolding it to her unfriendly ears.

"Miss Vincent will be delighted, no doubt," she remarked at the conclusion, affecting not to understand his purpose, and added: "Indeed I will see the thing through; so let us begin."

The summer evening was simply perfect after the hot, oppressive day. A balmy breeze came from the woods, and the flowers seemed to revive in its gentle breath. Before the stars had fully appeared in the purple dome of heaven, the moon rose and dimmed their sparkling light with her full-orbed splendor.

It was a most select and brilliant assembly that gathered by twos and threes in the old farmhouse, until the parlors were overflowing. Maggie Belmont was in high spirits at the com-

pliment of this gay surprise party. Mr. Lloyd was at her side and seemed most devoted. He found an opportunity of calling her attention to the exquisite moonlight without, and solicited a walk.

"What a fine idea! We will all go down to the bridge," she returned merrily. And so, after some delay in securing the dainty wraps of the ladies, they sauntered out through the garden.

Miss Belmont walked demurely with Mr. Lloyd, pouting to herself because that gentleman had on a sealskin cap. "How absurd!" thought she. "A man nearly six feet high wearing a fur cap in July."

"What a warm climate you must have in California!" she said with an arch glance. "This must be cold in comparison."

"Yes, it is warmer, but much more comfortable, for we have not the humidity which makes the heat oppressive. The hottest day is followed by a cool, refreshing evening, such as we never know here. In mid-summer, when the verdure upon the hills of Tuolumne is dry and yellow, and even the green chaparral looks dusty against the cloudless skies, we always have a breeze of pure air winging up from the coast, or down from the lofty Sierras, until, like the Olympians, we seem blessed with a royal atmosphere."

They had been walking a little in advance of the others, and now reached the bridge that spanned the Merrimac river. The beauty of this stream invited them to pause, and as they gazed upon its dark, moon-kissed waves, she went on rather saucily:

"If you are afraid of the dews and damps of New Hampshire, perhaps an overcoat would be serviceable."

He had bent down, and stood leaning over the railing of the bridge, which was high above the current. Lifting a floating end of her scarf up at arm's length to adjust it, her bracelet clasp caught in the objectionable seal cap, and as she drew her arm back suddenly, it whirled through the air down, down until it rested like a tiny boat upon the waves below them.

"There!" she exclaimed with an unconscious smile of glee, as she saw it whirl like a leaf in the eddies. "What are you going to do now?" she asked, and her face had a half-wicked, half-sympathetic look in it that made it bewitching.

"I will forgive you the accident if you will return to the house with me by the shortest cut, up yonder through the woods."

He could hear Mr. Raymond and Miss Vincent, who were approaching in company, laugh, probably at his discomfiture, he imagined.

"Such a delightful way," Miss Belmont replied. "We will pass the mill and the pond further on;" and raising her voice, she called to the rest, "Follow your leader," rather proud to guide them through the romantic vistas ahead at the side of this lion who walked like a chief, as imperturbed at the loss of his cap as though he had never worn one. His fine thick hair was displayed to advantage, and his good spirits and pleased manner made him more agreeable than ever before.

The dark, silent mill loomed into view, its sharp outlines as distinct as those of an etching against the arch of moonlight beyond it. The milldam was dark and smooth as a lake of ink, its still depths being shadowed by the woods on one side and by lofty piles of new balsam-scented lumber on the other.

But a few steps further on was the pond, and they crossed the little stream, its outlet, upon a bridge of planks. On reaching the center of this insecure structure, Miss Belmont glanced up, and, raising her hands, exclaimed: "Look! look at the pond!"

A volcano seemed to have sprung up in the midst of it and to have thrown balls of fire all around the banks. Crimson and yellow and purple lanterns waved beneath the deep shadowy boughs of the tree, and the floating pyramid of light in the heart of the lake illuminated the whole of its limpid surface.

They rushed on to view the wonder more closely, and reached a nook where an old lady offered them sherbets and ices, which sparkled in pitchers arranged about her fairy cave. Further on was another, and here two little girls presided over a feast of sandwiches and cakes.

"What does this mean?" asked Miss Belmont, scanning the host of friends who had reached her and now gazed about with as much wonder as she betrayed.

Before their expressions of surprise had ceased, a new vista of light blazed out, and a band struck up a cheering strain that swelled till the waters of the pond seemed a-quiver, and the woods rang with myriad echoes. Pleasure was reflected upon every face. With the thoughtlessness and enthusiasm of youth, they dispersed in groups, examining the pretty wonders about, when a shower of Roman candles shot up from the floating ark of light and made the heavens as brilliant as the grove. Then what cheering and clapping of hands rose above the music! This was followed by rockets, and more candles from the banks, and again more cheers. Perfect success had crowned the surprise.

At the head of the lake a tent had been pitched, and the earth under it carpeted to protect its occupants from the dampness. A large company of older people were seated comfortably inside, or before it, enjoying the surprise of those who came later than themselves as well as the unusual scene about them.

The hours fled with rare mirth and pleasure until the moon looked down from her luminous

throne in the zenith, and the candles had burned low in the lanterns.

Miss Miller had been bustling about, giving a hint here and there of the part she had taken in preparing the entertainment; her chipper voice and mysterious suggestions making her for once the center of every circle she entered.

But the air had begun to grow cold, and she sighed for a hot cup of tea. In fancy she could see the thin steam curling up from the warm cup, and the sugar and cream waiting to be mixed with the fragrant beverage in the mimic well. There were sugar and cream, and tea and cups, but all were cold, so cold that she shivered at the thought of them. A bright idea came to her aid. Why not heat some tea in a tin bucket, gipsy fashion? It was easy enough to build a little camp-fire. Oh! she would add another surprise for her tea-loving friends.

In a few minutes she had a fine blaze leaping up a heap of dry twigs and cones under some fir trees. The kettle began to bubble, and her gaze, which had been earnestly riveted upon the steaming liquid, did not note the little sparks that had shot away from her camp-fire and now wound along like serpents over the dry fir needles that had long since fallen and become as inflammable as paper. These treacherous fires crept up the trunk of the tree behind her, growing fiercer and stronger as they fed on the rich resinous drops that exuded through its bark. Unfortunately this tree was dying at the top, and as soon as the fire reached above the green portion it began to rage and flare boldly, growing wilder every instant in the breeze that fanned it. The tongues of fire reached out for other trees that interlaced their green boughs among the crackling branches of this one.

The consternation and surprise which transformed the gay company at hand into dumb spectators of the threatening calamity can be readily imagined. Miss Miller observed the sudden change, and, discovering the danger almost above her head, fled precipitately, and, unwittingly stumbling, fell with a shriek into the pond.

"Oh! my father's mill and all the lumber!" moaned Miss Belmont, clinging to her companion's arm. "Oh! they will all be burned, and that means ruin to us," she exclaimed with sudden energy, looking up into Mr. Lloyd's face.

He left her with her mother. The next moment the scream and splash of Miss Miller told of her mishap. Throwing off his coat, he plunged into the water after her with all the confidence of a good swimmer, and soon brought her thin, drenched form to the bank and laid it upon the grass, to be cared for by her friends.

Then he dashed toward the flaming woods, snatching up as he went an ax that had been left by those who had pitched the tent. While with vigorous strokes he chopped at the trunk of the burning fir, strong, active men procured buckets from the mill and brought water to quench the burning branches as they fell, and prevent a further spread of the fire upon the dry leaves beneath.

At length, the blazing monster came down with a crash, its flaming crown falling toward the lake; and ere the flames upon its charred limbs were extinguished, the smaller trees which had caught fire crashed down upon it and shared the deluges from the buckets, filling the air with clouds of steam and smoke.

In less than an hour from the time the fire had first been observed, Oliver Lloyd had rescued a lady from drowning and prevented a conflagration. He leaned upon his ax before them, dripping with the water of the lake, flushed and burned with the heat, blackened by the falling cinders, and half exhausted by his heavy exertions.

The company gathered around him, vying with each other in offering attentions; for he was no longer a mere lion, but had become a hero. Miss Belmont insisted upon twining her fleecy scarf about his neck, at the same time murmuring, "This Fourth-of-July entertainment is worthy of a Roman, and we owe it all to you, in addition to the preservation of the mill." The glance of her glowing hazel eyes said even more to him than her words and manner, and he placed her arm through his own with an air of confidence.

Every spark of the lanterns and all of the fire had been carefully put out; so he led her back to the farmhouse in triumph, followed by her hosts of friends.

Miss Miller was not seriously injured by her accidental drenching and fright, and she soon recovered, when her gratitude to the new hero was unbounded. Mr. Raymond continued to be assiduous in his attentions to Miss Belmont as heretofore, but after this long-remembered Fourth-of-July evening he received no more encouragement, since Oliver Lloyd had become her hero, and when he returned to the genial climes of Tuolumne he took her with him—his bride.

EDIBLE SNAILS.—New Orleans is the largest consumer of snails in this country. They are first thrown into hot water, says a Southern epicure, and killed. Then they are washed in a weak solution of lye, which removes the slime, and the shells are cleaned with stronger lye. Then the meats are boiled and replaced in the shells, with a dressing of bread and parsley, and thus prepared the snails are roasted. When the covers are removed from the dish one must eat the snails whether one likes them or not, the flavor is so enchanting. They can be eaten in two ways—the meat can be picked out with a fork, or the shell may be put to the mouth and the snail sucked out bodily.

The Fourth of July.

[Written for the RURAL PRESS by DR. J. W. GALLY.]

HISTORIC.

Since great John Adams first did say
That this should be, for after times,
A celebrated "epocha"
Of loud applause and ringing chimes,
We have not been remiss in noise,
Of voice and powder loud and high;
Of marching crowds and shouting boys
On this the 4th day of July.
Ah! there were boys, some here to-day,
Who, fired with glory years ago,
Were happy in the home display
And thrilled with music's brazen blow.
What since have those old boys beheld
When war's dense vapor filled the air,
And home-bred foeman loudly yelled
To fright the flag of Union there?
Well, they have seen that we'd forgot
In our great growing, full of pride,
The older struggle for our lot
By those who nobly did and died;
Forgot the little things that make,
Like mountain rills, the greater stream,
Till, face to face, we wide awake,
In bloody battles, from our dream,
To waste in men, and cash, and might
[Saying naught of broken hearts, though brave],
Enough to twice have bought the right
Of Freedom to the unhappy slave;
But, patience lost, we wrathful grew,
Lost all respect we either held
For either and to battle flew,
One cheering while the other yelled.
Not so the old men of yon day,
The heroes, of July the Fourths
"Mankind's opinion," so wrote they,
[Except King George's or Lord North's,]
We do respect with decency;
And then they made their great appeal
Which, often as we read, we see
Is strong with reason, calm and real;
No haste, no anger, no vile word,
No taunt from out the tortured heart;
But quietly they drew the sword
And coolly played the hero's part.

NEW THINGS.

New times are grand, new things are bright,
New men, new measures, new machines,
Bring with them thrills of new delight
And hopes of greater human means.
We know not if these things be best
For man's great future; but we know
That rest is born of great unrest.

OLD THINGS.

His name is lost who first put wheels
Upon an axle for the ox,
And he, no doubt, took to his heels
Pursued by "packers" orthodox;
That other name is, also, lost
Of him who first wrought iron tools—
Gone, gone forever, tempest-tossed
"Mid Time's old prehistoric" tools;
But iron and axle, rail and wheel,
Have quickened modern thought and skill
Till now we know not but we feel
That man grows more a manlier will.
Hail then to him, our far-off sire,
Who first took pry to aid his left,
When hunting caves to feed his fire
And earthen pot with savage thrift!
Hail honest thought expressed in stone,
Or wood, or metal, word or deed,
From pry sticks to the telephone!
Thus human thought aids human need;
But never let us loose our hold
On those great anchors of the past.
Use well the new, respect the old
So long as time or men shall last—
Take Patrick Henry's lamp to guide
Our feet, when darkness shuts the way;
But look ahead, as Morning wide
Spreads the new glory of a day.

SOME THINGS.

But something now must we abate,
There must be naught of hate for hate;
The grander North, the newer South
Have far outstripped the Nation's youth,
And peace, with her white wings outspread
Shadows a blessing on the dead
And, dove-like, to the living still
Means peace on Earth—to all, good-will.

BRITISH THINGS.

Even Britain, our most heavy ancient foe,
For whom this day means battle's overthrow,
Has nearly learned that hatred does not pay,
And takes our (now dead) hero from his way,
Around the world, to show him all respect.
Why should not we, if wisely we reflect,
Return a compliment the same to her
At any time, should favoring chance occur?
And more than that has old Great Britain done.
(A marvel under all the shining sun),
She's nearly found, 'neath very wise control,
That a Corkonian has almost a soul;
Seven hundred years she's held to the reverse,
And that same holding been, to her, a curse—
Beneath her young-old Premier, who can tell
How soon John Bull will get entirely well
So long as his physician's Charles Parnell?

SOME OTHER THINGS.

But leaving politicians to their lot,
Which may be as it may be, we know not,
There is another power marching on;
A Knighthood, not the chivalry that's gone,
But the young blood, the brawny-fisted Knight,
He that has come to stay and stays to fight—
Not fight with violence or war's display
But just enough to have his say and day.
As wealth, and church, and crown have had
Their days of power, both good and bad,
Why should not labor, honest labor,
Marching with his next-door neighbor,
Step o'er the list, with glove in helm,
And claim a loud voice in the realm?
He, certainly, has earned the right
To show, if there is aught in might,
That he's the mightiest man abroad—
The very child of the living God—
Who, whether under curse or grace,
Lives by the sweat of his honest face.
Hail Knights of Labor! from the shop or farm!
We lean upon your stalwart arm
In peace; and when the war drum rolls alarm
To you we look to shield us from all harm.

THE LATEST.

Now, if browed labor and high scheming wealth
Can come together, openly or by stealth,
No matter how, so long as honor rules,
And all men's children still may have the schools,
When will this day, the day we celebrate,
Be what it was, for Freedom square and straight?
But if all wealth falls to the cunning few,
And education narrows in her view,
Then will our annual plaudits be a lie—
And then farewell the 4th day of July.

POST SCRIPTUM.

The Muse had a word about the flag,
And a thought that is free from pelf,
But what is the use to boast or brag?
"Old Glory" speaks for himself.

YOUNG HOLKS' COLUMN.

The Heart's-Ease.

There was once a king who had a very beautiful garden, with grounds arranged with taste to please the eye, to afford refreshing shade, retired walks, commanding views, and, besides, all the delightful fruits that could be procured. There was one superb old oak, so high and grand that it could be seen for miles around. There were roses and lilies, and flowering shrubs of every kind; in short, nothing was wanting to make it a most perfect spot. One

clinging to the trellis and trees, but trailing sadly on the ground. He stopped and said: "Grapevine, what is the matter with you? Why are you lying so dolefully on the ground?" "Ah," said the vine, "you see what a poor weak creature I am; I don't even hold up my own weight, but must cling to a tree or post, and what can I do? I neither give shade like the oak nor bear flowers like the shrubs; I always must depend for support upon something else, and surely I am of no use."

On went the king, quite in despair to see his place going to destruction; and it grieved him to think that for all that kind care and attention he had lavished upon his garden, he was to be repaid but by murmuring and repining. But he suddenly spied a little heart's-

San Francisco. Woodland is a very handsome city, and one of beautiful homes as well as fine business streets. It is surrounded also by a rich and progressive country.

We are glad to call the attention of our young people to this structure at Woodland and the association which has secured it. The work done among our young men and young women by these organizations is incalculably valuable. There should of right be a disposition on the part of the people to aid and support them, and a desire among our young people to show, by their profiting by the work of the association, that they appreciate what is being done for them. We would like to see such an institution as that at Woodland in every town in the State.

The Opening of the Ball.

Our fathers were fighters, men who believed in Providence, but kept their powder dry. When they heard the Stamp Act had passed, which provided that the pigs and toothpicks must all bear the stamp of the Government, the stamps to be paid for by the colonists, of course, they instantly held town meetings in all the district schoolhouses and hurled defiance at the British throne. Patrick Henry, a member of the Virginia Legislature, on hearing of it, arose and said: "Sir, we must fight—I repeat, sir, we must fight."

"Death to the man who offers a piece of stamped paper to sell!" shouted the people of Boston. The ball opened on the 18th of April, 1775, at Concord, where our fathers had very thoughtfully stored away a big lot of explosives, probably for the purpose of celebrating their forthcoming Fourth of July. The precious store was guarded by a small squad of minutemen. General Gage sent a detachment of about 3000 redcoats to destroy these explosives. In dead silence, by the dim moonlight, they stole out of Boston, supposing their movements were unknown. But the patriots had eyes that could see in the dark and ears that could hear in the silence. In the gray dawn of the morning, Major Pitcairn rode up to a company on the village green and said, "Disperse, you rebels!" Regarding the remark as rather impolite, the militia retorted, "You're another," whereon there was a pretty lively time for a few minutes. The woods were full of minutemen. There seemed to the dazed eyes of the redcoats that there was one behind every boulder and fence-post. From every house, barn, pigpen and fence sped the unerring ball. Darker and fiercer the storm gathered. Wearied, mortified and disgraced, they reached Charlestown late in the evening, and on counting noses found they were short 273 men. Pretty good for the first day's work. The accompanying cut is supposed to be a realistic representation of the British army on its retreat. It seems to have been conducted in a somewhat informal manner. The unstudied action of the pedal extremities indicate a pressing engagement suddenly remembered. There are sundry other anatomical peculiarities about this picture of which the least said the better.

DOMESTIC ECONOMY.

CREAM CAKE.—One-half cup butter or one cup sweet cream, $\frac{1}{2}$ cups sugar, four eggs (one beaten separately), one-half cup sweet milk, two teaspoonfuls cream of tartar, one teaspoonful soda. Bake in a long pan. When done, cut open and spread between one pint whipped cream, one cup sugar. Flavor with lemon.

CHICKEN CROQUETTES.—Take a cold chicken, roast, boiled or broiled; mince it very fine, or it will not adhere; moisten with a rich gravy or with cream; season with pepper and salt and a little mace, if you like the flavor; make up into small forms, dip in egg, roll in breadcrumbs and fry slowly in pot lard.

BEEF FRITTERS.—Chop pieces of steak or cold roast beef very fine; make a batter of milk, flour and an egg, and mix the meat with it. Put a lump of butter in a saucepan, let it melt, then drop the batter into it from a large spoon. Fry until brown, season with pepper and salt and a little parsley.

TEA CAKES.—Rub together four teaspoonfuls of butter and one of sugar, add one well-beaten egg, one tablespoonful of cream and two cups of flour, into which has been sifted two teaspoonfuls of baking powder. Bake in small pans and eat while fresh.

SUET PUDDING.—One cup of molasses, one cup suet, one cup raisins, one cup of milk, two teaspoonfuls baking powder; add flour till very stiff to beat with spoon; put in a steaming pan or floured bag, and steam constantly for three hours.

EGGLESS CAKE.—Two-thirds of a cup of sugar, $\frac{1}{2}$ of a cup of sweet milk, $\frac{1}{2}$ of a cup of butter, two cups of flour and two teaspoonfuls of baking powder. Flavor to taste, and before putting in the oven grate sugar over it.

CHOCOLATE COOKIES.—One cup of butter, two cups of sugar, three cups of flour, four eggs, one cup of grated chocolate, $\frac{1}{2}$ teaspoonful of soda, and one teaspoonful of cream of tartar. Roll thin and bake in quick oven.

CREAM SAUCE.—Melt three ounces of butter; add flour to thicken with half a pint of cream; season with pepper and salt; let it boil and serve with chicken, veal or sweetbreads.

NEW BUILDING OF THE Y. M. C. A. AT WOODLAND, CAL.

day the king's head gardener came in and exclaimed: "O king, pray come and see what is the matter with your garden; everything is wilting, drooping and dying!"

While he spoke the other gardeners came running in, and all had the same story to tell. So the king went out, and there found all as they had said. He went up first to the grand old oak tree, his pride and admiration, and said: "Why, old oak, what is the matter with

ease, low down on the ground, with its face turned up to him, looking as bright and smiling as possible. He stooped and said: "You dear little heart's-ease! what makes you look so bright and blooming, when everything around you is withering away?"

"Why," said the heart's-ease, "I thought you wanted me here; if you wanted an oak, you would have planted an acorn; if you wanted roses, you would have set out a rosebush; if

THE RETREAT OF THE BRITISH FROM CONCORD.

you that you are withering and dying away?" "Oh," said the oak, "I don't think I am of any use, I am so large and cumbersome; I bear no fruit or flowers, and I take up so much room; and, besides, my branches spread so wide and thick that it is all dark and shadow under them, and no flowers or fruit can grow there. Now, if I were a rosebush, it would be worth while, for I should bear sweet flowers; or if I were a peach or pear tree, or even like the grapevine, I could bear you fruit."

The king next went to his favorite rosebush, and said: "Well, rosebush, what is the matter with you—why are you so drooping?"

"Why," said the rosebush, "I am of no use; I can bear no fruit, I have nothing but flowers; if I were an oak, like that one in the middle of the grounds, I should be some use, for then I could shelter you, I could be seen for miles around and be an honor to your garden; but as it is, I might just as well die."

The king then went to a grapevine, no longer

you had wanted grapes, you would have put in a grapevine. But I knew what you wanted of me was to be heart's-ease; so I thought I would try to be the very best little heart's-ease that ever I could!"

Dear children: Would you be like the heart's-ease? Then be just what God made you—a child; loving, kind and good; be the best little heart's-ease that ever you can!

Y. M. C. A. Building at Woodland.

We give on this page an engraving of the front of the Young Men's Christian Association building now in course of construction in Woodland, Yolo county. It is a handsome design, and is the work of Gilbert & Son, architects of Woodland. It is a credit to the energetic young men of Woodland that their fine town has the second Association building on the coast, the first being on Sutter street, in

The Week.

The observance of the National Birthday promises to be unusually wide and pronounced this year. It is fitting that it should be. Patriotism, it is to be hoped, we shall always have with us, but patriotism assumes forms of expression according to the prevailing moods and conditions of the people. Therefore as the disposition of Californians at the present time is buoyant, as activity pervades all our lines of industry and of thought, and as progress seems to be stamped upon everything involved in the advancement and development of our State, it is natural that there should be a general tendency toward marked commemoration of the favorite American holiday, the Fourth of July. From Shasta to San Diego various towns are getting ready for a grand time next Monday. We have not space to specify the many details of arrangements at interior points which come to our notice. They are doubtless well watched for in the local papers by the people most interested. As some of our friends always like to come to San Francisco, we will state that preparations foreshadow a memorable celebration in the metropolis this year—in fact, it is promised that it will be the "grandest ever held in the city." It is expected that there will be over 9000 men in the procession. There are to be eight divisions, and at the head of each division will be a "float" expressing some patriotic idea. In front of the

Native Sons there will be the great seal of California. The usual literary exercises will be provided and no doubt those who become the city's guests on the Fourth will have quite as much sight-seeing as they can attend to.

Those who are prevented by distance or otherwise from participating in formal celebrations will, we trust, plan for themselves and their children some fitting exercises. It is a good thing to recall to mind, and to teach the youngsters the great significance of the day.

Desert Land Frauds.

Whatever may be said of the theory of the late "desert land law," and whatever honest development may have been done under it, it has been fully demonstrated that it has been the cloak of some of the most wholesale and shameless land-grabbing. There has been so much of this grabbing done during the last decade, under one pretext or another, that it is difficult perhaps to tell exactly which specious measure has cloaked the most, but certainly the "desert land law" did its full share of the mischief. It now appears that the Government, under the lead of Gen. Sparks, is recovering some of this land, by sending out agents to see what the sworn statements of improvements amount to. Last Saturday Gen. Sparks took the necessary preliminary steps to cancel 55 desert land entries in Wyoming Territory, aggregating in all about 35,000 acres. In these cases the "final proof" was, on the face of it, all that was required, documents being filed to show that by means of ditches already constructed an ample supply of water is at hand to properly irrigate the land; that the claimants own the right to the water thus secured, and have never parted with their interest and have never agreed to do so. But the real state of the case is shown by the report of an agent of the Land Office from which the following is taken:

Upon a majority of the entries no ditches that would convey water have ever been constructed, while the few ditches that have actually been constructed never have been utilized. A survey of one large and several lateral ditches was made, and a plow-furrow made in many places to show the line of surveys, but no actual bona fide ditching was ever done by the claimants, or by any one for them. All the ditching that was ever done was of the most shadowy nature, and was not substantially useful, nor intended to be so. The land has not been reclaimed or irrigated to the slightest degree in any one of the 55 cases enumerated, and was, at the date of investigation, in the condition it was at the time the entry was made.

It is upon this evidence that Gen. Sparks proposes to recover the land for the Government. Certainly land that has been clearly forfeited should be recovered. The law was certainly good or bad enough to have honest work done under it, and it should be insisted upon. The provisions were exceedingly favorable to those who took up land under it, and where they were not complied with, the land should revert.

We like to see development and progress, and wish the desert to blossom as the rose, etc., but it is time that there should be no more haste in disposing of the title to public lands. The country is settling up so fast that all the vacant areas will be soon called for by individuals who desire to make homes upon it, or by co-operative colonies who can furnish the amount of labor and capital required to bring in water and undertake other large enterprises. There is no need to dispose of more at wholesale to large operators, who desire to hold it as large ranges or to peddle it out in homesteads to settlers and thus enrich themselves at the expense of the settlers. The railroads have been liberally treated, and new lines are multiplying without bonuses because the traffic is worth contending for. It would seem the plainest common sense to hold the rest of the public lands for actual settlers, and thus save some room for the overflow of population from the old and thickly settled States. We are glad the Land Office has a head who believes the Government land is good for something else than to get rid of.

Fires more or less disastrous in field and forest are reported from various quarters—as usual at this season. The heedless camper, the dropped match, the cigar-stump and the gunwadding are chargeable with sad losses every year. Let us, each one of us, be careful that we do not cause the mischief.

The Declaration of Independence.

The movement for independence was not any sudden explosion of heated passion, nor was it the work of one man or assembly of men. For months it had been talked over as a "consummation devoutly to be wished" by the mechanic in his shop, the fisherman along the northern coast, the planter in the Sunny South and the pioneers and hunters of the West. It had been discussed in town meetings, social parties, in the pulpit, newspapers, pamphlet, committees of safety and Provincial Legislatures. The members of the Colonial Congress were no company of reckless adventurers who had everything to hope and nothing to lose by a revolution. They all hesitated and listened to hear the voice of the people. On the 10th of May, 1776, Mr. John Adams ventured to suggest a measure which Congress adopted, "that all the colonies which had not established governments suited to the exigencies of their affairs adopt such governments as would conduce to the happiness and safety of their constituents in particular and America in general." That was the first step. It was a feeler of the popular pulse. June 7th, Richard Henry Lee, in the name and by the special authority of Virginia, proposed this resolution: "That the United Colonies are and of a right ought to be free and independent States, that they are absolved from all allegiance to the British Crown, and that all political connection between them and the State of Great Britain is and ought to be dissolved." This resolution was seconded by John Adams. The debate that followed was long and warm. Many of the members hesitated about taking so decided a step. Some still hoped that the eloquence of Chatham and the influence of Rockingham might effect an honorable reconciliation. The matter was finally adjourned to the first day of July.

The day set apart to consider Lee's resolution arrived. Fifty-one members were in their places. The outlook was ominous. The excitement caused by the display of gallantry at Bunker Hill by untrained militia had passed over. The business of the day began by reading a letter from Gen. Washington, who returned the whole number of men under his command that were fit for duty as 7754.

Many of these were volunteers for a year, whose term of service had nearly expired. All needed money, clothing and ammunition, and Congress had no power to levy a tax nor credit to borrow. Sir Henry Clinton had just arrived before Charlestown with a line of battle-ships, and the safety of that place was in doubt. New York was threatened by Lord Howe with a formidable armament that had already arrived at Sandy Hook. Gen. Montgomery had panted out his brave soul under the walls of Quebec, and the little army that had invaded Canada with so much hope was on the retreat, badly shattered by disaster and disease. The Indians on the frontier were already on the war-path. As yet no foreign power had sent a word of sympathy that could kindle a ray of light in the bosom of the most sanguine. Such was the aspect of affairs on the first of July, 1776. Is it any wonder that, when the order of the day was announced, for a few moments a perfect silence prevailed? John Adams broke the solemn stillness by a speech which tradition says was sudden, impressive, impetuous and powerful, and on the evening of the second day the resolution passed with only one dissenting colony, New York, not yet being able to concur. The Rubicon was crossed. The old 13 British colonies stepped forth among the nations of the earth free and independent States.

It now only remained to give the world the reasons for this important act, and to indicate the principles which this new people would acknowledge as the basis of their political action. It was ordered that a committee be appointed to prepare a declaration in support of this measure. This committee was chosen by ballot, and consisted of Thomas Jefferson, John Adams, Benjamin Franklin, Roger Sherman and Robert R. Livingston. It is usual when committees are elected by ballot to arrange their order according to the number of votes each one received. Mr. Jefferson had the highest and Mr. Adams the next highest number. It is said there was only the difference of one vote between them. Standing thus at the head of the committee, they were requested by the

other members to act as a sub-committee to prepare a draft. Mr. Jefferson drew up the paper. He showed it separately to Adams and Franklin, who only made a few verbal corrections. Congress now entered upon the consideration of this document. For two days its statement of principles was closely analyzed, and every word critically scanned. On the Fourth of July, 1776, it received the final approbation of Congress, and copies were ordered to be sent to each State, and that it be read at the head of the army. The crowning act was on the Fourth of July, and hence for all time the recurrence of that day will be fragrant in the memory of every patriotic heart. We can render no higher homage to those noble men who laid the foundation of our nation than annually to baptize our souls afresh in the spirit and meaning of this declaration.

It has been said, as if it were in derogation of this Declaration, that it contained nothing new; that it was a recital of old ideas and arguments that had seen service before. No doubt people sitting in darkness, wearing the yoke of oppression, may at times have caught a glimpse of the truth, that all just government derives its powers from the governed, and started as one who in a foreign land has suddenly heard the familiar accents of home. The growth of this idea, like all other great ideas, was slow and silent. It was cradled in the Magna Charta extorted from King John, June 19, 1215. It grew through the centuries, as the great oaks grow, becoming strong and tough in wrestling with terrible gales. From the discovery of America to the settlement of Massachusetts and Virginia, nearly all over Europe political and religious events were taking place, that to the wise men and seers of the day were harbingers of a new era. England for more than a century, unconscious to herself, was undergoing an education that was destined one day to run under the sea and shoot up in a fresher soil into a richer growth. The fostering of the spirit of commerce, the encouragement given to arts and manufactures, the modification of the feudal system of entails, these and kindred measures were helping slowly to form a new class in society aside from the barons and great land-holders and retainers of the crown, that would sooner or later claim a voice in political affairs. The great religious controversies, from the times of Wycliffe and Luther, perhaps more than any one agency, helped to change and liberalize society. But still we may safely aver that, up to the time of the announcement of this Declaration, the idea of laying the foundation of government exclusively upon the will of the people at best had never been anything more than a beautiful ideal that had sadly failed on trial in Greece and Rome, but might be realized in the millennium. It was our fathers alone who had the genius and courage to rise above all traditional reverence for kingly prerogatives and heraldic families and assert, as the corner-stone of their new government, that God had mingled divinity in the blood of every man, and the poorest and lowliest might rise up and say, "I, too, am a sovereign."

Improved Condition of Orchards.

Inspector Klee, who has just come back from a tour among the orchards of several interior counties, informs us that in Alhambra valley, Contra Costa, he found the trees in good condition and fruit promising, although in some portions of the county the fruit is rather small on account of the drouth. A general improvement is noticeable here, owing to faithful application of insecticide treatment.

From Contra Costa the inspector passed up the Sacramento river, spending several days in this fruitful region, where, more than anywhere else, he noted a decided advance over previous years. Orchards which were in very bad condition last season now show renewed life and vigor, and the crop prospects in general were very encouraging.

At Winters, Vacaville and Pleasant Valley the peach and apricot crops are very large; the preparations to dry and pack for foreign shipment are extensive, and all available help is busily at work.

In some localities the late hot winds damaged the Tokay grape considerably, but they also nearly annihilated the San Jose scale, so perhaps the gains equaled or outweighed the losses.

ENTOMOLOGICAL.

The Life History of the Icerya.

Forms of the Male Cottony Cushion Scale.

[From Advance Sheets of Report by PROF. C. V. RILEY,
U. S. Entomologist.]

Last week we gave the different forms of the female *Icerya*, and this week we have forms which are distinctively those of the male sex. It will be understood that the sex of the egg and of the newly hatched larvæ is not distinguishable, consequently Fig. 1 and Fig. 2, as used last week as early stages of the female, are to be considered as also leading up to the more advanced forms of the male, as given on this page.

The following is a quotation from Prof. Riley's report describing the figures given on this page:

The Male Larva—Probable Second Stage.—Neither Mr. Coquillett nor Mr. Koebele were able to distinguish the male larvæ until these had reached the stage in which they form their cocoons. Among the specimens studied at the Department, and which were sent alive from Los Angeles by Mr. Koebele, we have found a larval form which has not yet been described, and which we strongly suspect may be the male in the second stage. This form is illustrated at Fig. 1. It differs from our supposed second stage of the female in its more slender form, longer and stouter legs, and longer and stouter antennæ. The legs and antennæ are not only relatively longer and stouter, but are absolutely so. The body above is much more thickly clothed with the short stout hairs than the corresponding female stage, and the mentum is longer and darker colored. The antennæ are six-jointed, and the joints have precisely the same strange relative proportions as in the female. The secretory pores are present, but are not quite so numerous as in the female.

Male Larva—Third Stage.—In this, the third or last larval stage, the male is readily distinguished with the naked eye from the female in any stage by the narrower, more elongate, more flattened, and evenly convex form of his body, as well as by his greater activity in crawling about the trunk or branches of a tree. More careful examination shows that the beak is entirely wanting, the tubercle from which it arises in the earlier stages being replaced by a shallow triangular depression. The body is almost naked, being very sparsely covered with a short, white, cottony matter, and is destitute of the short but stout black hairs which are found upon the body of the female during the third and fourth stages of her life. In the absence of black spots and in the nine-jointed antennæ he agrees with the similar or third stage of the female, and the average length when full grown is about three mm. and diameter about one mm.

The Male Pupa and Cocoon.—When the male larva has reached full growth and is ready to transform it wanders about in search of a place of concealment, finally secreting itself under a bit of projecting bark, under some leaves in the crotch of the tree, or even wedging itself down under a mass of females. Very frequently, probably in the majority of cases, it descends to the ground and hides under a clod of earth, or works its way into some crack in the ground. Having concealed itself, it becomes quiescent, and the delicate, flossy substance of which the cocoon is formed begins to exude abundantly from the body. This material is waxy in its character, but is lighter and more flossy and less adhesive than that of which the egg-sac of the female is composed. After a certain amount has been exuded the larva moves backward very slowly, the exudation continuing until the mass is from 7 mm. to 10 mm. in length. From this method of retrogression it happens that the body of the larva is frequently seen protruding posteriorly from the mass, which naturally leads to the erroneous conclusion that the material is secreted more abundantly from the fore part of the body, whereas the reverse is the case. When the mass has reached the proper length the larva casts its skin, which remains in the hind end of the cocoon and pushes itself forward into the middle of the cocoon.

The pupa (Fig. 2) has the same general color as the larva, the antennæ, legs and wing-pads being paler and the eyes dark. It has also the same general form and size. All the members are free and slightly movable, so that they vary in position, though ordinarily the antennæ are pressed close to the side, reaching to basal part of metathorax (ventrally); the wing-pads also against the side, elongate-ovate in form and reaching to second abdominal joint. The legs are rather shorter than the diameter of body, and the front pair thrust forward. The anal end is deeply excavated, the abdominal joints well separated, the mesonotum well developed and the pronotum tuberculous or with some eight prominences; but there are no other structural peculiarities. The surface is, however, more or less thickly covered with waxy filaments, which are sometimes exuded in sufficient quantities to give quite a mealy appearance.

Whenever the pupæ are taken from the cocoon and placed naked in a tin box, they exude a certain amount of wax, often enough to partially hide them from view. If disturbed,

they twist and bend their bodies quite vigorously.

The cocoon is of an irregular, elongate shape, appearing a little denser in the center where the pupa has placed itself, and at the edges delicate and translucent. The material of which the cocoon is composed is very delicate, and appears like the finest cotton, but on submission to a gentle heat it melts as readily as the coarser secretion of the female, and leaves the larva or pupa, as the case may be, clean and exposed.

The Adult Male (Fig. 3).—A careful description of the male of this species has never been published. It was unknown to Mr. Maskell at the date of his first paper and has not been mentioned in any of his subsequent papers. Mr. Trimen attempted to breed it, but was unsuccessful. He says: "So little is certainly known of the males of the Coccidæ that I have kept from time to time a large number of this *Dortheia* under glass in the hope of obtaining the males, but hitherto without success. I once, however, found on my window a male of some *Coccus* which I thought was very probably that of the introduced species, as it agreed in most of its important characters with Westwood's

Fig. 1.

Fig. 2.

Fig. 3.

MALE FORMS OF COTTONY CUSHION SCALE.

figure of the male *Dortheia characias*. It was dark red, with the wings gray, and very slender and fragile in its structure. It measured 15 48 inch across the expanded wings."

The male was unknown to Prof. Comstock, but was very briefly mentioned by Dr. Chapin in the first report of the Board of State Horticultural Commissioners, Sacramento, 1882, p. 68. He found the male in numbers during a period of two weeks from September 25, 1881, but did not observe it in 1882. It is also mentioned by Matthew Cooke in his "Injurious Insects," etc., 1883, p. 166, and a rough and uncharacteristic figure is given at Fig. 146, plate 3. His few words of description are: "Male insect, winged; color, thorax and body dark brown; abdomen, red; antennæ, dark colored, with light hairs extending from each joint; wings, brown, iridescent." The following detailed description is drawn up from numerous specimens both mounted and living:

The adult male is a trifle over 3 mm. in length, and has an average wing expanse of 7.5 mm. The general color is orange-red. The head above is triangular in shape, with the apex blunt and projecting forward between the bases of the antennæ. The eyes are placed at the other apices of the triangle, and are large, prominent, and furnished with well-marked facets. There are no mouth-parts, but on the under side of the head is a stellate black spot with five prongs, one projecting forward on the conical lengthening of the head, one on each side to a point just anterior to the eyes and just posterior to the bases of the antennæ, and the remaining two extending laterally backward behind the eyes. The antennæ are light brown in color and are composed of 10 joints. Joint 1 is stout, almost globular, and

nearly as broad as long; joint 2 is half as broad as 1 and is somewhat longer; joint 3 is nearly twice as long as 1 and slightly narrower than 2; joints 4, 5, 6, 7, 8, 9, and 10 are all of about the same length as joint 3, and grow successively a little more slender; each joint, except joint 1, is furnished with two whorls of long light-brown hairs, one near base and the other near tip; each joint is somewhat constricted between its two whorls, joint 2 less so than the others. There are no visible ocelli. The pronotum has two wavy subdorsal longitudinal black lines, and the mesonotum is nearly all black, except an oval patch on the scutum. The metanotal spiracles are black, and there is a transverse crescent-shaped black mark, with a short median backward prolongation. The mesosternum is black. The legs are also nearly black and quite thickly furnished with short hairs. The wings are smoky black, and are covered with rounded wavy elevations, making a reticulate surface, a cross-section of which would appear crenulate. The costa is thick and brown above the subcostal vein, which reaches costa at a trifle more than four-fifths the length of the wing. The only other vein (the median) is given off at about one-sixth the length of the wing, and extends out into the disk a little more than one-half the wing length. There are, in addition, two white lines, one extending out from the fork of the subcostal and the median nearly straight to the tip of the wing, and one from the base in a gradual curve to a point

ruary, and he therefore concluded that the individuals observed by him would not attain full growth before that time.

The mature male larva requires on an average about 10 days from the time it begins to form the cocoon before assuming the pupa state, and the pupa state lasts from two to three weeks. The more reliable information we have been able to obtain would show that at Los Angeles the average number of generations each year is three.

Habits.

The newly hatched larvæ settle upon the leaves and tender twigs, insert their beaks, and imbibe the sap. On passing into the third stage they seem to prefer to settle upon the smaller twigs, although a few are found upon the leaves and still fewer upon the larger branches and trunk. The adults, however, almost invariably prefer the trunk and largest branches.

The insect is rarely found in any of its stages upon the fruit.

The species differs markedly from most Coccidæ in being active during the greater part of its life, though most of the traveling is done by the female immediately after the third molt and by the male just before settling to make his cocoon. At these periods they wander up and down the trunk and larger limbs until they find some suitable place, when they settle down, the male to pupate and the female to insert her beak and develop her eggs and their characteristic waxy covering. She is capable of slow motion even after oviposition has commenced, but rarely does move unless from some exceptional cause. In thus settling after their last wanderings both sexes are fond of shelter and will get under any projecting piece of bark or under bandages placed around the tree, the male often creeping under clods of earth. Both the female and the male, in adolescence, are most active during the hotter parts of the day and remain stationary at night; but the perfect or winged male is rather sluggish during the day, usually remaining motionless on the under side of the leaves of low plants or high trees, in crevices of the bark, or wedged in between females on the tree. There seems, in fact, to be a well-marked attempt at concealment. The recently developed individuals are found abundantly on or under clods of earth near their pupal cocoons, and they issue most numerous during the latter part of the afternoon. They are at first weak, awkward and ungainly, and instinctively seek some projection on the tree or elevation on the ground from which to launch on the wing.

At the approach of night they become imbued with a very high degree of activity and dart rapidly about on the wing. At such times they swarm around the infested trees. In September and October Mr. Koebele noticed that the males began their flight about 5 o'clock, and as soon as it was fairly dark they again settled down to rest. None have been observed flying at night and none have been attracted to the electric lights.

Machinery and Labor.

John Swinton, a labor advocate of some reputation at the East, recently gave an address in Boston on the revolutionary forces of the times. His audience, according to a report of the address in a Boston paper, pretended appreciation; but, according to the report before us, if true, he must have dealt largely in incoherent talk about Rome, Greece and mediæval history. Moreover his language must have been found very difficult of application to the points which he assumed to illuminate. One of the forces which were mentioned by him was the growth and massing of machinery. The truth of his statement is not to be disputed, but when he alludes to it disparagingly as working to the detriment of the laboring classes, he is running tangent to facts that have been demonstrated time and again as favoring the social and material condition of the working people. Though said with a sort of railery, there was much truth in the vulgar remark: "When the clodhopper reads, the clodhopper is lost. When the guttersnipe's head becomes a knowledge-box, the guttersnipe is impossible." The lowness of man's employment is raised in proportion to his mental education. No vocation is servile or degraded in itself, and it becomes so only because intelligence does not enter into its execution. Let the mind be educated to the employment of the hand and street-sweeping develops into a science. The meanness of labor is so because of the abasement of man's nature; elevate that and all that he undertakes is elevated. Instead of denouncing the condition of affairs in their relations to mankind, the best thing that can be done is to improve them, not to overthrow them.

MERCURY from 120° to 122° in the shade is the temperature reported at the Needles for three days last week, while Phoenix, Arizona, got it above 117°.

THE wheat crop in the Willamette Valley promises to be the largest raised for years.

The Women's Fourth of July Declaration of Independence.

[Written for the Rural Press.]

"I call this here meeting to order. I aint the president, ladies, I am only the chairman 'pro tem,' as that monster, man, says in his public perceedins."

THE PRESIDENT PRO TEM.

"Don't call no names," spoke up a little married woman who looked as if she was the "boss of the ranch," to use a homely expression; but the speaker gave her a severe look and proceeded: "Now, ladies. I want you to elect a promi—, no, a permanent president. This fol de rol way the—men have of doin' business, nominatin' and electin' two or three trumpety presidents afore they settle down to business, is just a wastin' time. Let us show our superiority by doin' things up to wonst. I therefore move we elect the woman that has—that has—what is it the men say?"

"If you please, Mrs. President, pro tem, we aint here to re-echo what the masculine gender say. We wish to be original; we must be, to improve our lowly brothers, or else, why this meeting?" spoke up a lady with a fair education and a fair exterior.

"Ladies, excuse me; it was a lapsis—well, a lapsis—"

"Lapsus linguae," prompted the lady with the fair exterior.

"Well, yes," said the P. pro T. "Now let us nominate the woman with the most grit and go in her for the office, and if it isn't your 'umblservant, let it be the next best woman." Then there arose a mighty

Babel of Voices.

Such as the Russian historians say characterizes their town meetings remote from the Capital even to this day; but out of which confusion order and good laws are at length evolved; so pardon the women.

After awhile the ladies got tired of nominating everybody and finally settled upon one of the handsomest, best-dressed and most intelligent women among them, and elected her by acclamation. She was assisted to the platform and introduced by the P. pro T. as "Our honored Presidentess (remember the 'ess,' ladies), Mrs. Lorina Madeline Clemmance, who is heart and sperrit in our cause." Then, amid the applause, she took not exactly a "back seat," but one at the side where it was convenient for her to jump up every little while and help direct the proceedings.

THE PRESIDENT.

The President bowed gracefully and said: "Ladies, this meeting, as far as I can understand, is called for the purpose of our declaring our independence; that is why it is called on this glorious anniversary of our breaking the tyrant bands that bound us to a foreign land under an odious King—"

"Queen—Queen Victori!" interrupted the P. pro T.

"Excuse me," smiled the President, "but that dear lady did not reign till many years after. Ladies, we must, we will make this glorious 4th of July more memorable than our forefathers did the 4th of July of old, for from this day we will become the

Foremothers of the American People.

The foremothers that have been so wrongfully, so ignominiously left out of history. We hereby declare that we will break the iron bands of custom, the 'What will Mrs. Grundy say?' of the women, the 'It isn't proper!' of the men. We know that there are many things that are right and beautiful and good for women to do,

from which they are debarred by tyrant custom." (Applause and cries of "hear! hear!" from the assembly.)

"We will take the every-day affairs of life first; the grand, the heroic, the beautiful will be discussed in their regular order."

"From this day we declare that it is just as right for a man to stay at home at night and take care of the baby, and get acquainted with it, as it is for a woman to do so; also to let his wife, his wife who has worked and worried and worried and worked all day long, go out and spend an evening in innocent amusement—not to have a 'jolly time,' as the men do eight times out of seven—"

"Oh!" came from the audience.

"Yes, I mean it. Till 12 is one night, but the gentlemen stay out very occasionally till two or three in the morning. Add these hours together and you will get the extra night, and perhaps two. (Applause.) We declare that they have just as much right to the sleepless nights, walking the floor with the twins, as we have."

"We declare from this time forth that the father is as much proprietor of the child as the mother is—that is, in its care and maintenance; that till 9 o'clock in the morning, when most of the gentlemen have to go to work, that they shall share the domestic economy, either cook breakfast or hold the baby while we do it, or, if there is no baby, sweep the dining-room or set the table; for, my dear sisters, we know too well that at breakfast-time there are generally a dozen things to be done at once, which the woman is expected to do with a pleasant face and without a murmur, while the (then) ornamental partner is dressed in his next-to-best clothes, and quietly (if he is not grumbling because we cannot do more things at once) reading the newspaper. Now, why should he have a

Half-Holiday Every Day.

For they generally end work at 5 P. M., while woman has not one, from month's end to month's end. When I say woman you will understand I do not mean the few, who for awhile are so favored by fortune that they can sit with idly folded hands if it pleases them to do so; no, I mean the women who make the world, who rear the voters—"

A voice came from the assembly, "Yes, and we oughter vote, too."

"I will speak of that presently," replied the President in a gentle tone. "Women who advance the arts and, I was about to say, sciences, but in that realm, my sisters, I am sorry to say, we are but in our infancy, save an exceptional few; but I am digressing. This is to be the day of our Declaration of Independence from error, from superstition, from wrongdoing and from scandal."

A few of the most enlightened of the assembly applauded, but some thought it a dreadful thing not to be allowed to say what they pleased of everybody else; but nobody must say anything of them, let them dare; and then who ever would begin anything on Friday; so there was quite a murmur of disapproval, but the President was firm and said:

"What is the use of meeting and speaking if we are to remain in the same old groove? 'Talk is cheap, and so are prayers,' whispered a gifted sister to me lately at a W. C. T. A. meeting. How men as well as women would sit in a chair or on the curbstone and talk till their tongues gave out, if the good things of this world would come to them for mere words; and others would pray till their knees were sore, if by doing so the blessings of this world and the next would descend upon them; but not all words are valuable, and not every so-called prayer ascends to the throne of Grace. Deeds, deeds are the key-notes to character. I see a lady standing. Please do not do so—if you only knew how unkind it is to those behind you. I was once at a public exhibition of the attainments of the pupils of the

Dumb and Blind Institution.

A lady in front of me persisted in standing. I finally told her that others behind her wished to see also, so for awhile she sat down very discontentedly, but at the more interesting part up she jumped again and remained standing. I thought her manners and her looks were great friends, for both were ugly. In a few moments up jumped a young giantess in front of her, this seemed like retributive justice, but I could see still less, and had no parol to poke her to sit down, for she looked as if she had some sense, but her actions belied her looks. Afterward, I asked one of those 'terrible creatures'—she smiled—a man—'what ailed my sex. Was it thoughtlessness or what?' 'Pure unmitigated selfishness,' he replied; 'they care but for themselves; if they see, all right, the rest can do without or stay at home.' Oh! my sisters, I have often thought we need missionaries at home almost as much as the poor African. We need to be taught to think of the comfort and pleasures of others, even strangers whom we may never meet again. We need to be taught when the car is full to draw our skirts a little nearer to us, to move just a little bit, to even take the child upon our lap, for whom we would grumble to pay a fare, to be just a little considerate, that others may be tired as well as we. Do you think that God takes no notice of these little things? Do you think there is as high a place in heaven for a woman who would stand up at an instructive exhibition knowingly cutting off the view of those behind her? Do you think there is as bright a crown awaiting the woman whose tongue has stabbed the reputation of a sister woman, or repeated evil words of another? Do you think that Christ will say

'well done thou good and faithful servant,' to the woman who hurts the feelings of the tender-hearted, or withholds the hard-earned money of those who labor for their bread, as for those who fulfill the spirit of God's tender laws? Oh! my sisters, we need to be taught in many things, so that we can set that example of purity of heart and tongue, that example of unselfishness of word and deed to our dear brothers, who profiting by it may reach that higher plane, from which they can clearly see that we, more than one-half of the human race, have not our full and proper rights."

Oh, now the applause was long and generous.

"Mrs. President, hadn't we oughter vote?" demanded the same voice as before.

"To vote is nothing," replied the President, "unless we can vote intelligently. A child can put a slip of paper in a box, but to put the right slip requires more study and thought than a woman can always give; yet I think she has the right, and if a great number tried, I think they would be allowed to deposit their vote, for there is nothing in the constitution to forbid it; but they should each subscribe a little money so as to be able to defend their cause by law. I think we have a right to a voice in the decision of who shall teach our children, and who shall preach in our churches. I think we have a right to utter our protest against selling immense tracts of

Public Land to Wealthy Men.

Or to foreigners. One man should never be allowed to own more than 500 acres of land at the most. One hundred and sixty acres is evidently enough to support one man and his family, or wise Uncle Sam would have made different laws about granting land to settlers. I was so happy the other day, when riding so far into the country that fences almost disappeared, that I exclaimed, 'Oh, this looks as if God owned the land.' 'You don't like fences?' asked a lady by my side. 'I do not like the whole country fenced in as if no one had a right to put their foot outside the confines of a dusty city. I do not like to think that our children and our children's children that come after us shall be debarred from the privilege of all God's creatures, a little home of their own. I would like women to have a voice in the matter of selling property belonging to the city in which they live, so that the little parks and breathing-places shall not be recklessly disposed of by a few officials whose term of office lasts but a few years, but the effect of whose bad deeds remains forever. Witness the selling of the city's property on Market street, where a beautiful small park could have been made that would have been a boon to the citizens of San Francisco, and made the public buildings an ornament instead of the unsightly pile they now are, and to think that poor beautiful Oakland

AFTER MARRIAGE.

is likely to suffer also, for the hand of sacrifice is already raised above the only pretty public spot there is for half her citizens; and like the claws of the terrible vulture is impatient to descend upon its prey." (Applause.) "If there is a lady present from the country, we should like her to come upon the platform and give her views of what is needed to ameliorate the condition of women whose lot is cast in the beautiful country."

Up rose a tall, gaunt woman of 40 summers. "We want less work." "Step right on to the platform," said the P. pro T. "Less worry, less hours of labor, more good clothes, more amusements, more books and more newspapers," and down she sat amid great applause. "Is there a single lady present who will please to step this way and tell

What She Thinks Would Benefit

Those who have the courage to remain single and take up a life of work."

A very sweet lady arose. "I have but a few words to say, so will not come to the platform. We, being single, are not represented in the various administrative assemblies in the country, as the gentlemen claim that we are; and as we number many thousands, and many of us own property, therefore we have taxation without representation, which is tyranny, so that tyranny is exercised toward us American women, against which our forefathers fought, bled and died; but what can we do—we, the poor old maids of the land?"

"Old maids, indeed! I think we are the most sensible of all the female portion of the world," said a sour-faced woman, walking straight to the platform. "Welcome, my sis-

ter," said the P. pro T., embracing her. "No man to worry our lives out," she continued, holding her umbrella under her arm, "no master to order our goings and comings, and to begrudge us our hard-earned clothes. No husband to be flirting with the girls behind our

FLIRTING.

backs, but before marriage so sweet, yet after that important event letting us drag along the best way we can, carrying all the babies. No! if we are compelled to earn our own living, when we come home it is to peace and comfort, and a good book. It is the old maids who have done something for the good of the world. Witness Rosa Bonheur, the glorious painter;

BEFORE MARRIAGE.

witness Miss Herschel, the wonderful astronomer; Florence Nightingale, the dear mother of the sick and sore. But it is true what my sister says: we should have representation, and the day is not far distant on which the tyrant man will be compelled to give it to us!"

She sat down amid tremendous applause.

The president said: "Ladies, I wish you to think well over all that has been said, and help us on our next meeting night with your advice and counsel. Our 'declaration' will be ready by that time, to which we wish all your signatures appended, and they will become as celebrated as those of the signers of the declaration of old. Ladies, work heart and soul for our great cause, and you will never regret it!"

"Three chairs for our noble presidentess," shouted the P. pro T., and they were given with a will. Then the assembly adjourned, to meet again at no distant day.

FANCY AND FUN.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

EVERY FARMER THE BEST is the CHEAPEST HIS OWN MILLER

WE HAVE HAD
32 years Experience.

Use the Halladay Standard Geared Wind Mill, I-X-L Corn Sheller and I-X-L Iron Feed Mill and do your shelling and grinding at home, thus saving toll and teaming to and from the grist mill. This work can be done rainy, windy days, when outdoor work is suspended on the farm. The same mill will cut corn stalks, saw wood, run churn and grind-stone, pump water, etc.

We manufacture the Halladay Standard Geared and Pumping Wind Mills, I-X-L Corn Shellers, I-X-L Iron Feed Mills, I-X-L Stalk Cutters, Horse Powers, Jacks, Saw Tables, Standard Haying Tools, consisting of Anti-Friction, Reversible, Swivel and Rod Hay Carriers, Harpoon and Grapple Horse Hay Forks, Pullers and Floor Hooks. Also a full line of Tanks, Tank Fixtures and Pumps for Farm, Ornamental, Village and Railway purposes. Send for catalogue and prices. Reliable Agents wanted in all unassigned territory.

A GOLDEN OPPORTUNITY

Invest in a Fresno Vineyard

We have for sale, till July 31st, a one-half interest in a fine vineyard ranch, 266 acres, all level and susceptible of easy irrigation, situated near Minturn, Fresno county; 135 acres in best varieties wine and raisin grapes three and four years old, in full bearing; low estimate is 350 tons this year; 15 acres in 8-year-old orchard and table grapes, full crop; 8 acres in 8-year-old almond in full bearing; 50 acres alfalfa; 40 acres grain. Entire tract under rabbit-proof, lumber fence; amply cross-fenced. Main dam, gates, ditches, dykes and water, all belong to premises. No litigation, no riparianism, no costs. Undoubtedly best system of irrigation in the State; beautiful reservoir. Two good dwellings picturesquely located beneath the beautiful foliage of 9-year-old ornamental trees. Two very large barns, an abundance of shed-room. Agricultural implements, machinery, etc. Horses, hogs, mules, cattle and sheep. The object in taking a partner is to build wine-room, storage house and adobe cellar, and must be sold before July 31st in order to utilize the coming immense crop. Price \$20,000. For full particulars address us or (better) come and see the property.

THE JUSTLY FAMOUS

Anderson Springs

Are beautifully and delightfully located in a grand natural park, with fine large groves of forest trees, gurgling trout brooks, and the greatest variety of valuable mineral springs known in any one locality, including hot iron and sulphur springs and a cold iron spring.

These springs have been well established for years by the present proprietors, who furnish

Excellent Board with Good Home Cooking.

Good care is taken to make living at the hotel and cottages as pleasant and agreeable to all as possible.

The remedial qualities of the springs are indeed wonderful. Excellent bathing in both mineral and pure water, including natural-puffing steam baths.

Board, \$10 to \$14 per week. Children under 12 and over 3 years of age, half price; 2 and 3 years of age, one-fourth price. Route from S. F.: Take morning train to Calistoga, Napa Co., Cal. Stages leave Calistoga daily for Middletown, fare, \$2. Private team to springs, \$1. Express and P. O. address, Middletown, Lake Co., Cal. Write for further information.

J. ANDERSON, Proprietor.

WEST COAST LAND CO.

TEMPLETON, SAN LUIS OBISPO CO., CAL.

Home of Wheat, Fruit, Wine and Olive; 15,000 acres sold in past 3 months to 220 settlers, representing a population of 1100; 49,000 acres—small subdivisions—average, \$22.50 an acre; 1 cash, balance 5 years, 6 per cent. Catalogues and maps free. C. H. PHILLIPS, Manager.

THE GOLDEN GATE PLUG CLOSET.

WITH TRAP.

This Closet is the Best, Because

1. It has a simple, strong valve, suitable for any pressure, self-closing by a genuine Phosphor Bronze Spring, acting with the pressure. To prevent breaking and weakening of the spring, I have gone to the expense of using Phosphor Bronze Wire, which will have the desired effect.

2. It has a real sanitary overflow, a copper float attached to a bell of the same metal resting on face of the brass overflow pipe, operated by the rising of the water in the closets above its level, thus absolutely preventing any escape of sewer gas, even the closets being without water.

3. It has no dead corner, consequently no foul water will be left in the closet after lifting of the handle. A constant rush out of the flood chambers will keep the closet and trap perfectly clean.

With above stated points, I am able to call my Closets the most perfect and cheapest in the market. N. B.—Architects who endeavor to furnish their patrons with the most reliable goods, should not hesitate to give this closet a trial. Send for descriptive catalogue.

JOSEPH BUDDE, Manufacturer, 43 Fremont St., San Francisco.

FRUIT MARKETING.

Fruit Union Notes.

EDITORS PRESS:—Telegram received from Chicago June 28th reads: "Bartlett's selling at from \$4 to \$4.50 per 40-lb. box; Royal Hative plums, per 20-lb. box, \$2; Royal apricots, in crates of 20 lbs., \$1.50 to \$1.75; peach apricots, \$1.50 to \$1.75; peaches at \$1.50. Weather is fine and cool, and fruit keeping well."

We are loading a car every day here now, which is being made up of small consignments from all around. Peaches at \$1.50 pay very well. The price is what it is because of the unusually large number of Tennessee peaches in the market which are fully as good in taste as our early peaches of the Briggs' Red May and Alexander varieties. Just as soon as we begin shipping Early Crawfords we can expect better prices; but even at the above figure it nets the grower at least 65 cents for not over 18 pounds of fruit.

Messrs. Dix & Wilkes have been appointed agents in Baltimore, and Blake & Ripley agents in Boston.

Messrs. Sgobel & Day, agents in New York, write us that they can furnish an immense market for our grapes; that from October 15th to November 15th, last year, their city used 22,000 barrels of Almeria grapes weekly, equal to five trains of our fruit each week, and none sold for less than \$4 per barrel of 50 pounds. Their people much prefer our grapes, if they can get them, as they far excel in flavor the Almeria grapes. Our great difficulty in selling at auction, they inform us, will be to have the fruit put up in a uniform manner. It is sold entirely by sample, and should the sample of any shipper be either better or worse than the rest of his pack in the same lot, the result would be equally disastrous. Then, too, they find trouble in getting our growers to have all marking on one end. The shipper's name and residence and the variety of the fruit should all be on the same end. They have worked the matter up very thoroughly, and the dealers there are all on the qui vive to get our fruits at auction, which will allow them all a chance to get some. Apricots are selling at \$3 per 20-pound crate at this date, in a small way. We have sent two cars, and a third goes to-night. Next week more will follow. The first car arrives to-day, and at this writing, if all is well, the first auction of California deciduous fruits is now going on, with Messrs. Brown & Secomb as auctioneers, in New York City. We will probably receive word from there by wire this afternoon.

Our Eastern manager, Mr. Blowers, is so sanguine of the outlook for prices in the East that he notified his foreman to ship his apricots to New York City.

The Baltimore, Boston and New York people seem to have taken the agency of the Union with a desire to make it a success, and are straining every nerve to bring about that result. To date we have sent 38 cars East.

H. A. FAIRBANK,
Secretary Cal. Fruit Union.

Sacramento, June 28.

Sacramento Notes.

EDITORS PRESS:—The fruit season has commenced in earnest. The strawberry crop is about over; was a light yield this season. The Early Wilson blackberry has been in market since June 6th, and had it not been for our late hot wave the crop would have been heavy. The Kittatinny are coming in and will soon be followed by the Lawton.

The peach crop will be immense. Shipments of early varieties began some weeks ago; others will follow as they ripen. Prunes will not bear a corner. It is an off year—not one-fourth of a crop. What there are will be large and fine.

Our grain-growers are harvesting their crops. The yield is better than expected. Wheat shrunk somewhat.

Mixed farming is the true plan for small farmers in this State, in fruit, grain and varied heads of stock. If one thing is depreciated or light, other things come in to balance.

The boom keeps everything moving, both in city and county. Real estate is open for purchase, and large tracts are being cut up to accommodate a more thickly settled population. With all our varied tropical fruits and flowers and healthful climate, our California homes are reaching far and drawing in the people of all races and tongues.

G. R.
Sacramento, June 27th.

FRUIT PROSPECTS.—On another page of this week's RURAL may be found brief notes from fruit-growers all over the State, concerning the outlook for the different fruits. The reports are condensed from a long report made to the State Horticultural Society by B. M. Lelong, secretary of the State Board of Horticulture. It will be noticed that most correspondents report fewer traces of the apple worm or codling moth larva than usual. We hope it may prove so through the season, but we fear the worm has been retarded by the character of the season and may appear in force later. However, anything which may betoken a reduction of the pest is good news.

10,846.—INSULATING MATERIAL—J. B. Williams, S. F., reissue.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

THE WEATHER.—The weather of the week has sustained its reputation for being "exceptional." There has been another hot wave, but fortunately the grain is beyond harm, and we do not hear that it was high enough to injure fruit, though it has precipitated the ripening somewhat more than desirable in some cases. The southern part of Santa Clara and the Pajaro valleys had a rattling thunderstorm which terrified old residents and made new-comers from the East feel at home. There has also been rain at several points in the State. Grapes are reported somewhat affected by adverse weather conditions this year, both in blasted berries and coulure.

GRAPE GRAFTING.—It is announced that J. H. Wheeler, Chief Executive Viticultural Officer, is getting up detailed suggestions for the use of those who desire to experiment with "herbaceous grafting" of the grapevine. It is said to have been practiced extensively in Hungary for 50 years past, and consists in grafting in summer on the green grape shoots, thereby forming a resistant cutting that may be immediately planted the following spring. The idea is to get resistants to the phylloxera the first year, instead of waiting two or three years.

THE LOS ANGELES COUNTY POMOLOGICAL SOCIETY will hold its next quarterly gathering at Orange, July 7th. These horticultural love-feasts have become famous, and wherever they are held there is sure to be a good attendance and interesting proceedings. This society has done more than any other to bring about an acquaintance between people of different sections of the county and to inspire a feeling of fraternity and co-operation among the fruit-growers. Orange is sure to give the pomologists a hearty reception.—Los Angeles Times.

Florida, "The Land of Flowers,"

Is a paradise for the invalid, and the "Fountain of Youth" was once thought to be hid in one of its forest glades. It is now the haven of many consumptives, who find benefit in her genial warmth and fragrant flowers. The consumptive invalid need not necessarily go so far from home and friends to get relief. For if not in the last stages of the disease, Dr. R. V. Pierce's "Golden Medical Discovery" will restore to perfect health. For all chronic throat, bronchial and lung diseases it is a most reliable specific. By druggists.

Mother's Smiles are the Sunlight of Home.

There would be fewer clouds and brighter sunshine in many households if every dispirited suffering woman realized what a boon Dr. Pierce's "Favorite Prescription" is for all weaknesses and maladies to which her sex is liable. No lady who gives this wonderful remedy a trial will be disappointed by the result. It not only acts promptly upon all functional derangements, but by its rare nerve and tonic properties strengthens and repairs the whole feminine system. Price reduced to one dollar. By druggists.

It outwits all.—Dr. Sage's Catarrh Remedy.

A GLOVE.—There is probably no line of goods that requires more care in manufacturing than gloves. This is owing to the large number of pieces which must be accurately adjusted in order to make even a presentable glove. A visit to and an inspection of the Leak Glove Manufacturing Co.'s establishment is all that is necessary to convince one that they are fixed to do just what they profess to be doing—making the best gloves in the world.

EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature. Wind and weather at 12:00 M. (Pacific Standard time), with amount of a fall in the preceding 24 hours. Note "T" indicates precipitation inappreciable.

THE STATE FAIR

At SACRAMENTO, Cal., Sept. 12 to 24, 1887.

\$2000 in Cash for County Exhibits.

SPECIAL ATTENTION OF THE FARMING COMMUNITY

Is called, as well as the various Immigration Societies, Boards of Trade of the several Counties, and all others interested in bringing out the resources of their respective Counties, to the advantages offered by an Exhibition at the

STATE FAIR

Of the varied products of their counties. The supervisors of each county are invited to make a liberal appropriation, sufficient to pay the expenses of getting together an Exhibition of County Products. Premiums received can be returned to the treasury of each county making the appropriation, so that their respective counties would be written up and advertised at a small expense by an exhibition of this character. The Railroad Company transports the same free of charge.

THE LIVE STOCK EXHIBITION, connected with the State Fair, is sure to attract Eastern visitors anxious to view the resources of California.

APPLY FOR SPACE AT ONCE, as the Society is willing to devote the entire exposition building, if necessary, to displays of CALIFORNIA PRODUCTS. A NEW FEATURE has been added to the Premium List this year, in the shape of awards for a Sheaf Display of Cereals. Forty Sheaves, not less than 10 inches in diameter, of 10 varieties of grain are called for. Not necessary to be grown by exhibitor. Notice is now given that samples may be gathered during harvest, and laid away for exhibition. Address the Secretary for Premium Lists and other information.

EDWIN F. SMITH, Secretary.

L. U. SHIPPEE, President.

ALLEGRETTI

Air-Purifier and Preserving-Room System.

Worth's Patent Combined Screw and Toggle Lever Wine and Cider Press.

First Premium awarded on Wine Press at Sonoma and Marin Agricultural Fair, Sonoma Agricultural Park Association, Santa Clara Valley Agricultural Society and Mechanics' Institute, S. F.

I desire to call the attention of wine and cider makers to my Improved Press. The following has a movement of 2 1/2 inches, the first revolution of the screw moves the follower 1 1/2 ins., the last revolution is but 1-16 of an inch, thereby the power increases in the same ratio as the resistance. The platform is 50 inches wide and 10 feet long; is run back and forth under the press on a railroad track.

Has two baskets, by which you can fill the second basket while the first one is under the press, thereby doing double the amount of work that can be done on any screw or lever press in the market that use only one basket, for this reason: While my press is working continuously the other kinds are doing nothing during the time they are emptying and filling their basket.

Printed Testimonials can be had on application of the following parties, who have bought my press: J. B. J. Portal, San Jose; Wm. Pfeffer, Guberville; Joseph Walker, Windsor; Kate F. Warfield, Glen Ellen; Joseph Drummond, Glen Ellen; Isaac De Turk, Santa Rosa; John Hinkelman, Fulton; J. & F. Muller, Windsor; R. C. Stiller, Guberville; Lay Clark & Co., Santa Rosa; Vache Freres, Old San Bernardino; J. F. Crank, San Gabriel; James Finlayson, Healdsburg; P. & J. J. Gobbi, Healdsburg; Wm. Allen, San Gabriel; Wm. Metzger, Santa Rosa; J. Lawrence Watson, Glen Ellen; Walter Phillips, Santa Rosa; Geo. West, Stockton; Eli T. Sheppard, Glen Ellen; Rancho Wine Co., Rancho, Los Angeles Co.; Downing Fruit & Wine Co., Downey; J. L. Beard, Centerville; Wm. Palmatag, Hollister; A. Burnham & Son, Santa Rosa; Paul O. Burns Wine Co., San Jose; E. Emil Meyer, Santa Cruz Mountains, Wright P. O.; Marshall & Hill, Laguna Station; R. J. Northam, Anaheim.

Also manufacture Worth's Patent Hand and Power Grape Stemmers. W. H. WORTH, Petaluma Foundry and Machine Works, Petaluma, Sonoma Co., Cal.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

Dr. J. Koeberig—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,
DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

Dr. J. Koeberig, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

H. M. NEWHALL & CO., Agents, 309

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,
E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1/2 pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

S. F. MARKET REPORT

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, June 29, 1887.

The weather the past week has been hot, but there was an absence of hot winds, which are the dread of this State in the months of June and July. Harvesting is progressing favorably, although the grain in some sections is shelling out. The Eastern market has ruled fairly steady at low prices, about \$1.20 per cental for August options. European advices are virtually unchanged. To-day's cable is as follows:

LONDON, June 29.—Cargoes off coast, seems weaker; cargoes on passage and for shipment, weaker; red wheat, very dull; white, firmly held; French country market, dull; Liverpool wheat, spot, inactive; Liverpool wheat, Cal. 75 to 75 rod.

Eastern Wheat Markets.

NEW YORK, June 26.—The collapse of the wheat deal and vigorous purchases of shippers here started an unusual movement of grain from the West. Walker, ex-statistician of the Produce Exchange, places the amount of wheat on the canal between Buffalo and New York at 2,570,000 bushels. Estimates of decrease in visible supply now range from 1,500,000 to 2,000,000 bushels. A fairly active business in wheat was done within the two hours allowed to trade in on Saturday; purchases for export exceeded 230,000 bushels, and the market was steady, without important variations. June closed firm, at 92c. Other deliveries closed weak—July at 85½c; August, 85½c.

NEW YORK, June 29.—12 M.—87c for cash, 93½c for June, 84½c for July, 84½c for August, and 85½c for September.

CHICAGO, June 29.—1 P. M.—Wheat, firm; cash, 69½c; July, 70c; August, 72½c. Corn, about steady; cash, 35½c; July, 26c; August, 27-16.

California Products at Chicago.

CHICAGO, June 28.—California green fruits are in good request and fairly active as follows: Apricots, 20-lb. boxes, \$1.50 to \$1.75; Apricots, ½ crates, \$1.75 to \$2.00; Peaches, 20-lb. boxes, \$1.75 to \$2.00. The arrivals to-day were rather small. The demand, however, was also light. Fine goods could be sold, but the peaches coming in continue of common quality and rule dull. The retailers regularly do not care to handle them, and stand-peddlers and dealers in fancy fruit prefer California goods. Plums are coming in to only a moderate extent. Really fine, large are salable and steady; common and small are as usual, slow. Ten-pound boxes of the cherry variety sell at \$1.25 to \$1.50 box. Peaches, 20-lb. boxes, \$3 to \$3.25 and ½ crates of Royal Hative, \$2.75 to \$3. Cherries are scarce. Choice cherries, either soft or sweet, find ready sale and command good prices. Oranges, 25 to 40 boxes, according to quality. The offerings and demand are both light. Beurre Giffard pears being \$3.50 to \$4.00, and Bartlett \$4.50 to \$5.00; stock in soft order sells at less prices.

Of California dried fruits the supply is rather light and the market quiet; pitted plums, evaporated, 10 to 15c; pitted plums, sun-dried, 10 to 15c; apricots, evaporated, spot goods, 22 to 25c; future delivery, 10 to 15c; sun-dried, none here; prunes, 9 to 11c; raisins, London layers, 20-lb. boxes, \$1.40 to \$1.50; loose Muscatel, \$1.25 to \$1.30; California layers, \$1.25 to \$1.30.

New potatoes \$1.75 to \$1.90 per 100 lbs.

California Products in New York.

NEW YORK, June 26.—Green Fruits.—Fine California peaches, \$1 per doz; blue plums, 35c per doz; Tangerines 75c per doz; selected apricots, 25c per doz. Seeds.—California yellow and brown mustard has met with increased attention, with sales reported of about 800 bags on private terms. It was quoted at the close at 4½ to 5½c, respectively.

New York Hop Market.

NEW YORK, June 26.—Holders of desirable goods are firm at quoted prices, but buyers are equally firm in holding back. There is no business worth speaking of. Coast crop, 1886, best, 22 to 23c; same, common to good, 16 to 20c; 1885, good to prime, 10 to 13c.

Eastern Wool Markets.

NEW YORK, June 26.—The general tone of the market seems to be on the mend. The manufacturing demand is improving, but fleeces are still scarce, and there is a decided difficulty in finding desirable parcels of mediums. Among sales were 2,000 lbs. spring California at 22c; 20,000 lbs. fall California at 14c; 10,000 lbs. scoured California, mostly at 56c; 10,000 lbs. Oregon at 26c; 15,000 lbs. Montana at 23½c.

The Philadelphia market remains unchanged. Receipts are light and sales lighter than week before last. Among sales were 1000 lbs. of California fall at 13c; 29,000 Oregon fine at 28 to 28½c; 7000 lbs. Territory scoured at 54c; 2000 lbs. coarse Territory at 28c; 2000 lbs. coarse Territory at 36c; 2500 lbs. Territory fine at 19c; 2000 lbs. Territory fine at 21c; 2000 lbs. medium Territory at 22c.

The Boston market is considerably mixed and prices quoted vary widely. Among sales were 107,500 lbs. Territory at 21½ to 22½c.

BOSTON, June 28.—Wool is in fair demand. Ohio and Pennsylvania extra fleeces, 33c; XX, 34 to 35c; Michigan extra, 31 to 32c. Other grades are unchanged.

PHILADELPHIA, June 28.—Wool is quiet and unchanged.

NEW YORK, June 28.—Wool is quiet and generally steady. Domestic fleeces, 30 to 37c; pulled, 14 to 34c; Texas, 9 to 24c.

Local Markets.

BAGS.—The market is not quite so active, with an easier tone, owing to the June contracts coming in on the market. Standard Calcuttas are quotable at 6½ to 7 cts.

BARLEY.—The market held to steady prices throughout the week for actual barley. On Call, trading was fairly active, with only slight fluctuations. To-day's sales were as follows:

Morning Session: Buyer 1887—100 tons, \$1.16½;

200, \$1.17; 900, \$1.16½. Seller 1887, new—100 tons, \$1.08½; 100, \$1.08½ per cwt. Afternoon Session: Buyer 1887—400 tons, \$1.17 per cwt.

BUTTER.—Gilt-edged high colored hard butter is very scarce, and wanted; but off colored and soft is in over-supply, with the market weak.

CHEESE.—The market is easy, under liberal supplies and a light demand.

EGGS.—Strictly choice fresh laid are wanted, and command 25 cts, while off qualities are in heavy supply and move slow at from 18 to 22½ cts.

FLOUR.—The market is steady at full prices. Several mills will shut down for repairs.

WHEAT.—The market is inactive for actual wheat here, although free sales of choice in the country are reported at full figures. In options, trading was free throughout the week, with strong buyers taking all offered for sale. At to-day's Call sales were as follows:

Morning Session: Seller 1887—1800 tons, \$1.88½; 300, \$1.88½ per cwt. Afternoon Session: Seller 1887—200 tons, \$1.88½; 1900, \$1.88½; 600, \$1.88½; 300, \$1.88½; 100, \$1.89; 100, \$1.89½; 100, \$1.89½ per cwt.

[COMMUNICATED.]

Market Information.

Cereals.

The Revenue and Agricultural Departments of the Government of India have issued the following report, dated Simla, April 27, 1887, on the estimated outturn of the wheat crop in the Lower Provinces of Bengal, for the season of 1886-87: "The cultivation of wheat on a large scale is, in the Lower Provinces, confined to the Patna and Shahabad districts of the Patna division, and to the Bhagulpore and Monghyr districts of the Bhagulpore division. Excessive rain during September and October last made it impossible to prepare land for wheat in due time, and the crop has, moreover, suffered from rust brought on by the heavy rains in January. On the whole, it may be said that the area sown was less than the normal, and the outturn will be about three-fourths of the average." A cable from London says that the Indian Government's final crop estimates are received. They say: For the northwestern provinces and Oude the prospects of the wheat trade appear less favorable for 1887 than was realized in 1886, and far less than for 1885. First, because the outturn is 6 per cent less than in 1886; second, because stocks are drained to their lowest ebb; third, other food crops are inferior, causing a great consuming demand. The central provinces, the report says, prove rather worse than was expected. In the north, where some damage was reported done by the frost, this proves more extensive than was believed.

In this department the writer has given the utmost attention to the statistical situation of wheat, and by reference to back numbers of the RURAL PRESS patrons will see that everything combines in forcing the conviction that before another harvest we will see higher prices than known for years. Briefly stated, the situation is as follows: The reserve supplies in England, France, Russia and Germany (India is noted above) is all of 50 per cent below the average of the past three years. Owing to the low price of wheat for the past two years, the acreage seeded to the cereal in Great Britain and throughout Europe is less than seeded the two preceding seasons. Owing to unfavorable weather in France, and also in Hungary, parts of Russia, and also in India, the crop is below an average. In Great Britain the outturn, at this writing, promises a full average. The consumption of wheat-flour in Europe has increased to a most remarkable extent, and therefore the requirements are much greater. Turning from Europe to this country, we find an unfavorable outlook, for under the most favorable circumstances the crop of the United States will not go above 400,000,000 bushels, if that, against about 460,000,000 bushels last year, and an average for the past five years of 440,000,000 bushels. Not only will the crop be short, but the consumption will be larger. Aside from this, the carryover will be the smallest known for years. At the very outside it will not exceed, visible and invisible, 50,000,000 bushels against a carryover, from the season of 1885-86, of over 75,000,000 bushels. The Argentine Republic had a larger surplus this year, as had Australia, but they combined will not export 300,000 tons—not as much as Washington Territory and Oregon will export this year. Still in the face of all this the San Francisco Chronicle is advising such action on the part of the Produce Exchange of this city as it is claimed by the many will send the price of wheat down here.

To give its remarks more force, the paper cites the action of the Chicago Board of Trade which brought about the recent panic in wheat at the East, and caused cash wheat in Chicago to sell at 67½c per bushel (equal to \$1.12½ per cental), which is the lowest price within 25 years. The lowest price in 24 years previous to this was on December 15, 1885, and on October 11, 1886, when cash wheat sold at 69½c per bushel. The Chronicle has evidently overlooked itself in trying to send the price of wheat down against farmers' interests, but then it is said that this is not the first time the daily papers wrote against farmers' interests. Last year when wheat was low, the RURAL PRESS gave all the information correctly and predicted higher prices, but the daily papers only saw low prices and wrote against wheat. Patrons of the PRESS will bear the writer out when he asserts that No. 1 shipping wheat went from \$1.30 per cwt. at which it sold in July, 1886, to \$1.85 in last month—a difference in favor of farmers of \$1.10 per cwt.

Crop advices in this State are not quite so favorable. The hot drying weather has matured the grain too fast, and more shelling is being reported than was last year at harvest-time. Aside from this, the crop of white wheat is less in some counties than is red wheat. This is particularly the case in Los Angeles county, where the mills will have to import white wheat for their use. The crop in that county is about 20,000 tons, against 31,000 tons last year. The Oregon and Washington Territory crop is turning out well. The surplus there promises to be fully as much as it was in 1885-86, when it reached a little over 300,000 tons against about 240,000 tons for the season drawing to a close. But then this does not include the flour exported.

The visible supply of wheat at the East, as telegraphed to S. S. Floyd & Co. of this city, was on June 27, 39,270,000 bushels, a decrease of 2,000,000 bushels for the week.

Advices from the different sections where harvest-

ing is going on report that barley is brighter in the coast counties than it was last year. This probably is due to the fact that there was less fog this year. The crop this year will not exceed 325,000 tons against about 500,000 tons last year. The Los Angeles Express states that the crop in that county last year was about 1,000,000 bags, but this year it is placed at 600,000 bags, with the consumption more than double that of last year. Taking the consumption in Los Angeles as a basis, it is safe to say that the consumption of the State will this season be all of 400,000 tons. In estimating the consumption it is hardly safe that the increase of the entire State will be more than 33½ per cent, for in several counties there will not be any increase.

The oat crop of the State is not up to an average, but the crop in Oregon and Washington Territory is above an average. The consumption of oats is light, owing to their high cost, but as supplies and receipts are light the market is fairly steady.

Corn has a steadier tone at the low prices, owing to diminishing stocks at the East.

Rye is inactive under light supplies and no demand, owing to the high asking price.

Feedstuff.

Ground feed is in good demand, but supplies being more liberal, values are barely steady for bran and middlings; but for ground barley and feedmeal the tone is firm.

The hay crop is about all cut. The yield is not up to last year, but the quality averages better. Owing to the large increased consumption and the poor pasture, farmers sell sparingly, which keeps the market strong.

Fruits.

The market continues bare of dried fruits. All coming in are sent to the East, where there is an active trade call.

Raisins are in light supply, but the demand is also light. Apricots are in good supply. Canners are free buyers at from \$30 to \$40 per ton for the more choice.

Cherries, currants and gooseberries are coming in more sparingly, causing a stronger market. Blackberries and strawberries are in liberal supply, with the market gradually easing off.

Apples and pears are in free supply, but the quality is, as yet, only fair.

Peaches are in light receipt, but heavier supplies are expected to come in soon. Lemons are strong and higher, as are limes. Plums are coming in more freely, but as yet they are only sold to the trade.

Live-Stock.

The market for beef cattle and mutton sheep continues depressed, with more sellers than buyers. It is claimed that prices here are below those ruling in the country. Small calves are becoming scarce, and are wanted. Hogs for the block are more inquired for, but buyers do not quote a higher range. In work-horses the demand is quiet, but for general utility horses and matched teams there is a continued free inquiry.

The following are the wholesale rates of slaughtering to butchers:

BEEF—Extra, 7c; first grade, grass fed, 6½c—c per lb; second grade, 6c; third grade, 4½ to 5½c.

MUTTON—Ewes, 5 to 5½c; wethers, 6 to 6½c.

LAMB—Spring, 7 to 8c.

VEAL—Large, 6 to 7c; small, 6 to 8c.

PORK—Live hogs, 4½ to 4¾c for heavy and medium; hard dressed, 6½ to 7c per lb; light, 4½c; dressed, 6½ to 7c; soft hogs, live, 3½ to 4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Vegetables.

Cabbages are lower, and weak at the decline. String beans and peas are strong, as is choice asparagus. Other vegetables are weakening off under more liberal supplies.

Tomatoes are coming in quite freely, with sellers shading prices each day. Canners, it is thought, will soon be in, at least when the harder kinds come in more freely.

It is impossible to give a fair index of the market, as prices are governed from day to day by the receipts.

Wool.

The market continues to hold to strong prices, with buyers still paying a slight advance for the better grades. The Philadelphia Commercial List just to hand has the following to say of the market: "Manufacturers have no confidence in present prices, and, while many of them are short of wool, they buy sparingly at ruling figures, or are holding off for a break in prices, which they feel must come later in the season, in which view they are strengthened by the break in the coffee and wheat speculation of this week. Some Eastern dealers are withdrawing their buyers in the country, as they are unwilling to follow the upward tendency in prices, in the belief that a loss on wools bought at ruling rates in the interior is inevitable. The oldest houses in the trade cannot recall a time so near midsummer when there was such universal determination not to buy the clip at going prices, which appear to be on an average from 50 to 60¢ per lb above the opening prices of last year. In some sections where medium washed wools are grown, a greater advance has been demanded. One prominent Eastern house, whose agents had exceeded instructions and who had bought considerable wool at 35c in Ohio, resold its entire purchase to the agent of another Eastern concern at 36 to 37c on board the cars. We hear of other instances in which purchases have been resold for similar reasons."

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

On the way.....271,133 306,803

In port, disengaged.....115,212 33,319

In port, engaged.....15,567 27,324

Totals.....401,912 367,446

The above gives a carrying capacity as follows:

1887, 643,059 short tons; 1886, 587,908 short tons; increase over last year, 55,151.

No vessels have been taken the past week for wheat loading. As will be seen above, the tonnage here and to arrive is more than enough to take away this year's surplus crop.

The hop crop of Washington Territory is placed at one-third less than last year, but in this State it

is more. Buyers are anxious and bid 20 cts for fair new hops.

Beans are steady, although some dealers report a weaker tone.

Honey is coming in more freely, with good grades in request at full figures.

Poultry, under light receipts and a good demand, is higher.

San Francisco, June 29, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations. WEDNESDAY, June 29, 1887.

IN THE DRY SEASON

The WATER QUESTION beomes very important. It is now a SETTLED FACT that the CYCLONE WINDMILL will raise MORE WATER with LESS WIND than any Mill yet produced. There is no wind about this advertisement, but there will be MUCH WATER, because some people will buy a "Cyclone" after reading it, and consequently the Agents of other Mills WILL WEEP. These tears, however, being SALT WATER, are not available for IRRIGATION.

HEADQUARTERS FOR ALL KINDS OF BALING PRESSES —AND— HAYING TOOLS.

THE MONARCH, JR., HAY PRESS.

IMPROVED FOR 1887.

Any young man can earn more on an investment of \$500 in this press than can be earned in expending \$2000 for any other machine. We have a Monarch Press, which we sell for \$800, but has been used a very little and is just as good as new, which we will sell for \$450.

THE CLIMAX HAY PRESS, \$300.

Weight, 2200 lbs. A crew of three men—four can be used to advantage. Five ropes are used on the bales. Capacity, 10 to 15 tons per day. The best press for the money in the world.

The Celebrated Petaluma Baling Press.

Weight, 2600 lbs. Price, \$350, delivered at the factory. Size of bale, 22x22x48 inches. Capacity, 26 tons per day. Weight of bale from 225 to 400 lbs. This remarkable machine still stands at the head of all vertical baling presses, and probably bales three-quarters of all the hay west of the Rocky Mountains.

Whitman's IMPROVED New Rebound Plunger.

GREATLY IMPROVED FOR 1887.

Do not confound our New Press with that made two years since. EVERY PRESS FULLY WARRANTED. For one or two horses. The most powerful in use. The most rapid and durable, and the most perfect. Makes the most perfect bale. The most simple to operate. Least expense for repairs. NO STOPS FOR TYING BALE.

The Greatest Success of the Age.

Victorious in every contest. Double-acting, with new concentrating power. Do not buy a Press until you have seen the IMPROVED New Whitman with concentrating power. Puts from 10 to 15 Tons in a Car.

16x18 Mounted, weight, 3600 lbs. \$400 00
16x22 Mounted, weight, 3300 lbs. 450 00
All make bales of variable size.

Hay Forks, Hay Carriers, Harpoon Forks, and all kinds of Haying Tools in great variety. In baling your hay, use our Steel Baling Ties. Cheaper than Wire—Better than Rope.

TRUMAN, ISHAM & HOOKER,
421—427 Market Street, San Francisco.

THE GIANT POWDER COMPANY.

PATENT OWNERS OF
NOBEL'S DYNAMITE,
NOBEL'S EXPLOSIVE GELATINE,
NOBEL'S GELATINE-DYNAMITE,
Best and Strongest Explosives in the World.

As other makers IMITATE our Giant Powder, so do they Judson, by Manufacturing a second-grade, inferior to Judson.

BANDMANN, NIELSEN & CO, General Agents, San Francisco.

JUDSON POWDER,

The Only Reliable and Efficient Powder
For Stump and Bank Blasting. From 5 to 20 pounds blows any Stump, Tree or Root clear out of ground at less cost than grubbing. Railroaders and Farmers use no other.

MERY'S IMPROVED PIONEER

BARLEY CRUSHER

Using the Benoit Corrugated Rollers.

STILL AT THE FRONT.

This Mill has been in use on this Coast for 6 years,
TAKEN THE PREMIUM AT THE STATE FAIR

Four years in succession, and has met with general favor, there now being

Over 200 of them in use in California, Nevada & Oregon
It is the most economical and durable Feed Mill in use. I am sole manufacturer of the Corrugated Roller Mill. The Mills are all ready to mount on wagons.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

HAY PRESSES.

THE HURRICANE,

A Mounted Double-Ender Baling Machine,
capable of baling 40 tons per day.

ITS RECORD

For the first year of its existence is as follows: Four tons in one hour, nineteen and three-quarters tons in a half day, thirty-seven and one-quarter tons in one day, and 1800 bales in six successive days.

Two sizes: Compressed bales and common bales. Improved this year so that it is nearly one-quarter faster than before, and the back-and-forth movement of the horse lever is made to bring the hay across the stack and hoist the bales into a pile.

Has three or four times the capacity of Eastern-made presses, with the same number of men and horses.

Price, at factory, San Leandro, Cal., \$1000.

THE JUNIOR MONARCH

Does its own Tramping. Feeds at Side,
near the Bottom.

HAS THE FOLLOWING RECORD:

33 tons in one day; 105 tons in 3 1/2 days; 20 tons, and over, daily average for the season; 2350 tons with one press in one season; 23 sold in one valley last season.

Price, at factory, San Leandro, Cal., \$500.

Genuine Price Petaluma,

With Latest Improvements.

Made under the supervision of the inventor, JACOB PRICE. Too well known to need further description. First-class material and workmanship. Capacity, from 10 to 18 tons per day. Hay must be tramped in press.

Price, at factory, San Leandro, Cal., \$350.

Send for large illustrated Catalogue of above presses. Office and Factory, SAN LEANDRO, CAL. Address

EVERY FARMER HIS OWN THRESHER AND MILLER.

TO SOLVE THE GREAT PROBLEM OF PROFIT AND LOSS, REMEMBER THAT

Reducing Cost of Production Equals Increasing Market Prices,

AND THIS IS ACCOMPLISHED ON THE FARM BY

Utilizing Your Farm Help and Stock to Thresh and Grind Your Grain and Feed.

ST. ALBANS' GRAIN THRESHING OUTFIT.

Complete in Every Particular.

CONVENIENT, ECONOMICAL, RELIABLE.

Thresher and Cleaner Loaded Inside of Power on the Road.

Outfit Attached. Ready for Service.

Reduced Price List, delivered in San Francisco ready for shipment.

The following prices are fully 25 per cent less than the same quality of goods were ever offered in this market before:

One Horse Thresher, Separator and Cleaner, small belts, wrenches, etc. (23x16 inch All Iron Cylinder).....	\$175 00
One-Horse Tread St. Albans' Power for driving the above.....	175 00
Two-Horse Thresher, Separator and Cleaner, small belts, wrenches, etc. (28x18 inch All Iron Cylinder).....	200 00
Two-Horse Tread St. Albans' Power for driving the above.....	200 00
Three-Horse Thresher, Separator and Cleaner, small belts, wrenches, etc. (32x18 inch All Iron Cylinder).....	285 00
Three-Horse Tread St. Albans' Power for driving the above.....	285 00

One of these popular outfits will enable small farmers, and even large ones, who have long suffered in various ways by entrusting their threshing to other parties, to accomplish the same work and in a much more satisfactory manner, without any special yearly outlay, besides doing it when most convenient to themselves, instead of at some one else's pleasure.

The "St. Albans" are the most powerful Powers and reliable Threshers made; have the greatest separating capacity, most perfect cleaning facilities and are the most popular in the market, costing less, although accomplishing more than any other make. Write for prices of complete outfits.

THE SCIENTIFIC MILL.

FOR GRINDING BARLEY, EAR or SHELLED CORN,

AND ALL KINDS OF

Grain for Feed.

No. 4 MILL SET UP.

No. 4 MILL TAKEN APART.

No. 0 JUNIOR MILL.

FOR SUCH WORK IT HAS NO EQUAL!

The Grinding Plates are a Special Metal, Hard as Steel, Guaranteed to Grind 5000 to 8000 Bushels before Wearing Out.

THE BEARINGS are in one casting, consequently are always in line and cannot get out of true.
THE JOURNALS are in half boxes babbitted with the best metal and can be adjusted to take up all wear.
THE SHAFT is of the finest cold rolled steel of ample size and perfectly true.
THE FLY-WHEEL AND PULLEY are turned, and, with the Running Plate, are put on shaft and balanced accurately, so when in mill they run perfectly true, without any shaking or undue strain on it.
THE VIBRATOR keeps moving constantly when grinding ear corn, so that it cannot clog in the hopper.
THE "SCIENTIFIC" IS THE ONLY MILL MADE HAVING SUCH PROVISION.
THE HIGH DISCHARGE is most convenient for delivering the feed, and as it draws a current of air through, it prevents heating, as is frequently the case with Iron Mills.
THE PIN BREAKER provides against damage to mill should iron, steel or any hard substance accidentally go between the plates.
THE MOST PRACTICAL THING OF THE KIND EVER INVENTED.

THE FEEDER provides a successful means of regulating the feed when grinding small grain and cotton seed.
NO OTHER COB MILL has any such provision. In fact the "Scientific" is superior to other mills of this class.
THE SIMPLEST. Can be taken apart and put together in a short time without the aid of a mechanic.
THE STRONGEST. All parts are heavy and well braced, and especially adapted to the work.
THE LIGHTEST RUNNING. Having but one shaft, running in bearings, which are always in line, with Fly Wheel, Pulley and Plates accurately balanced, it follows it must run with least possible friction.
THE MOST DURABLE. Can be run in either direction by simply changing the spout and crossing the belt. This gives double wearing capacity to the plates, as they sharpen themselves each time they are reversed.
THE BEST MILL ON EARTH. of the best material throughout, and every part made especially for its place.
EACH MILL GUARANTEED TO DO ALL WE CLAIM FOR IT.
 SEND FOR PRICE LIST.

PRACTICE TRUE ECONOMY AT HOME AND SUCCESS IS ASSURED.

It is much easier to REDUCE EXPENSES by these means than increase profits by any known rule.

The Long and Short Haul.

The Interstate Commerce Commission took the ground recently that competition existing between any road and any outside carrier not amenable to the law constituted dissimilar circumstances, and therefore allowed such a road to charge less for a long haul than a short one if it were necessary to secure a share of the business. Now Judge Deady of Oregon has given a decision to the same effect and in harmony with a judgment which he pronounced two years ago when a case came before him under the Oregon law to regulate railway tariffs.

Judge Deady takes this ground: The railway manager "is instructed that he is authorized to make a less rate for a long haul than a short one, in conjunction with connecting lines or otherwise, whenever, by reason of competition with other lines or means of transportation, the same is necessary to enable the Oregon & California road to retain or acquire business." In his decision two years ago, Judge Deady laid down the principle that a railroad corporation has the right to live, and in his recent decision says: "This opinion has been before the world for more than two years, and on account of the importance of the subject it has attracted some attention, but, so far as I am aware, it has received no unfavorable criticism, and time and reflection have fully satisfied me of the correctness of the ruling."

The deduction from this, on the face of it at least, seems to be that transportation companies are not to be restrained from entering into competition, and that to get a share of the business, may charge low rates for competing points, irrespective of distance. Few would contest this proposition, because to permanently restrain from competition until one party thereto was ruined would in itself destroy competition and leave the public at the mercy of the surviving carrier. This would not be desirable to the public, and it would work injustice to the party whose business should be ruined and capital idle. Competition is the cure of high tariffs and competition should be preserved, not destroyed.

But there is another side to the question, and that is the injustice done to shippers from or to non-competing points by charging them enough to cover the loss of profit on business done to competing points. This is the evil which has been complained of, and it should certainly be

looked to. The interests of interior points should be guarded. It is wrong to carry at a nominal rate to a competing point and make up the loss by charging "all the traffic will bear" at non-competing points. The only way to reach this is the adoption of a maximum rate which shall be fair to carriers and shippers, either for short or long distances, and then allow competition to adjust rates at any figure below this limit.

HERBACEOUS GRAFTING.—A very interesting

The King Orange.

Among the curiosities at the Riverside Citrus Fair of 1880, our special correspondent noted a trio of the "King orange from Imperial Gardens, Saigon, Cochin China," obtained through Hon. John A. Bingham, our Minister to Japan. Those specimens had a thickly wrinkled and dark brownish-yellow skin. On being cut, they proved to have uncommonly large juice-bags and to be very sweet, though quite lacking in "character," which latter fact might have been

A Grand Animal.

It is some time since we have given our first page to something massive in the way of horned stock, and lest the growers of such animals might think us negligent of their favorites, we give a portrait of a famous imported Shorthorn bull Von Tromp, brought from Scotland by a Canadian importer, and now owned by Wilcox & Liggett of Benson, Minn. Von Tromp was bred by Mr. Amos Cruickshank at the famous Sittyton farm in Scotland, and traces through a pedigree of blue blood. He was calved December 11, 1881; sire Barmpton, one of the most famous bulls at Sittyton, of the justly celebrated Townley Butterfly family of prize-winning fame; his sire, the Royal Duke of Gloster (29,864); dam Barmpton's Flower by Allen (31,172). Von Tromp is a half brother to Col. W. A. Harris' famous Cruickshank bull, Baron Victor, and his dam, Victoria 45th, was also dam of Victoria 63d, whose daughter, Linwood Victoria brought at a public sale in Kansas City the handsome sum of \$1000; Caesar Augustus, the sire of Victoria 45th, was got by Champion of England, whose fame has become world-known. With such a pedigree, we may well say that Von Tromp is the inheritor of blue blood. Like his sire, he is of a deep red color, of great substance, and a sire that places his

IMPORTED CRUICKSHANK SHORTHORN BULL, VON TROMP.

article by Mr. Wheeler, Chief Executive Viti-cultural Officer, may be found upon another page of this issue. It gives a detailed description of the Hungarian method of setting grafts in growing canes, or herbaceous grafting as it is called. It must, of course, be understood that Mr. Wheeler does not advance this method as one to be adopted by our vine-growers, but merely for experimental purposes, to determine if it be applicable and valuable here. It is probably late in the season to make much use of the suggestion, but it is possible that enough can be done in an experimental way to gain some points which may be of use at least in shaping future experiments. It seems to us that Mr. Wheeler's suggestions, if used as they are intended, can hardly fail to draw attention to methods of propagation, and perhaps draw out some original methods of working which will be of especial local value.

Efforts are being made to complete the Pacific Coast railway in San Luis Obispo county in time to handle this year's crops.

due to the length of time that had elapsed since they were picked. Dr. Magee, the exhibitor, then intended to plant their seeds, and if they came true thereto to propagate the exotic.

Mr. J. E. Cutter—who we understand has now three bearing trees of this variety, and several hundred young budded trees—has just sent us several samples of the fruit. His accompanying note says it is "of strong acid, late (June) maturity, high flavor and remarkably refreshing quality, all of which fit it for a summer orange."

The specimens at hand are shaped somewhat like a Rhode Island greening apple—slightly flattened at the poles. The skin is thickish and has rather a lumpy surface; the pulp is of deep hue, with very delicate membranes, juicy and highly piquant in flavor.

SOUTHERN CALIFORNIA.—We have received from the *Expositor* of Fresno a reprint of Mr. B. Marks' letters to that journal concerning his recent visit to Southern California. Mr. Marks' writing is never dull, and in these letters he has reached a high mark for raciness.

characteristics upon his progeny. Von Tromp's laurels in the prize ring during his career in this country show the value placed upon him by judges. The Grandview herd of Shorthorns, owned by Messrs. Wilcox & Liggett, contains blood of such noted families as Young Mary, Rose of Sharon, Lady Bates, Helpa, Victoria, Comilla, Bloom and Dewdrop.

THE PURE-WINE LAW.—Mr. Henry Kohler is now under arrest for violation of the Pure-Wine bill, in not stamping his wine when no demand had been made by the purchaser and complainant for wine bearing the stamp. The Wine-dealers' Association will test the constitutionality of the law in this case, and if it is decided to be constitutional, will force the growers to carry it out to the letter, thus hoping to make it unpopular.

THE DISTRICT LAND OFFICE of Washington Territory is to be removed from Olympia to Seattle, where it will be more accessible to most of the people of the Territory.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Butte County Notes.

EDITORS PRESS:—Having seen but little of late in your valuable paper relative to this part of the State, I take the liberty of sending you a few items which may be of some little interest, not only to yourselves but to your many readers.

The ingathering season is upon us, both in the matter of fruits and cereals, and our city and its environment present one continual scene of activity.

The barley crop is being rapidly harvested, and so far as we can learn farmers are quite well satisfied with yields and quality. The oracles of the community say that this article is in larger supply than usual this year, and that, locally, prices will rule lower than previous seasons.

The wheat yield promises well, and while perhaps, owing to a smaller rainfall than usual, there will not be a large crop, yet there will be a good average and the lack in quantity will be made up in quality. Butte is one of the banner counties of the State in that line, and has not forgotten her cunning.

But while agriculture is the principal resource of this part of the county, it is not the only one; and Chico, "loveliest city of the plain," is surrounded by orchards and vineyards, large and small, which are but promises of the fruition that is to come.

The largest of these, of course, and the most noted of all, are those of General John Bidwell, which, together with his mansion and beautiful grounds, form a paradisaical suburb to the town. On this magnificent place fruits in their season are ripening and being marketed in numerous ways.

Large quantities are being shipped into the mountains and interior in all directions; carloads are being shipped to Chicago and other Eastern cities; quantities are being dried; and last, but not least by any means, the cannery is being run to its fullest capacity, and is daily absorbing tons of luscious fruit.

This cannery is a veritable model, and we venture to say has scarcely a compeer in the State. It is a valuable adjunct to the orchards, and the quality of fruit that issues from its doors is unsurpassed. About 150 men, women, girls and boys are at present employed in this department, and the greatest of care is exercised that everything shall be neat and clean.

Chico is at present experiencing the incipency of a "boom," which will, we trust, ere another year has passed develop into full-fledged prosperity.

The Branch Normal school has been adjudged to us, which when completed will, together with our numerous other school buildings, furnish an abundance of galleries wherein "the young idea" may be taught how "to shoot." For our success in getting this school we are largely indebted to General Bidwell, who made a princely donation in the way of a site, as has already been mentioned in the RURAL.

In anticipation of the hosts that are to come seeking for homes, etc., some of our large farms are to be cut up this coming fall and winter into 5, 10 and 20 acre lots; which segregation will become the genesis of a new era, we hope. The fact has become public property that General Bidwell will put about 1200 acres of his best land upon the market this winter in small tracts. This land is only half a mile from town at its nearest point; and those desiring beautiful spots for homes upon the best land in California, where everything grows without irrigation, have only to seek and they shall find.

CHICO.

A Visit to the Chabot Observatory.

EDITORS PRESS:—A friend having arranged for us to visit the Chabot Observatory on the evening of the 30th ult., we set out, though the night was most inauspicious for star-gazing. In the city here it was cold and windy, and one of our characteristic fogs hung thick and wet over everything. Not a star was to be seen, but the moon was in its first quarter—the best time to observe it—so we concluded to go, especially as we had been told to come even though the evening was not clear in the city, for we could see the instruments and learn something about them.

So across the bay we journeyed, and right glad were we all that we went. Mr. Chas. Burckhalter, one of the gentlemen in charge of the observatory, received us, and was indefatigable in trying to make things as pleasant and instructive as possible. It was not so cloudy in Oakland, still it was no night to look at the stars. We got a sight, however, of the moon through the telescope, and of the large mountain on it, Copernicus. This immense crater, which is 55 miles across, looked like a small ant-hill. On one side there are a number of irregular streaks which look like tracings on sand; these, we learned, are supposed to be large canyons. When we consider the distance of the moon from us, about 240,000 miles, we wonder that we can see objects on it even as well as we do. Because of the bad weather on this evening, Mr. Burckhalter could only magnify 200 diameters. We

wanted to see Saturn and his brilliant sister Venus, but they were not in a favorable position for telescopic observation. We saw Jupiter, though, with his moons, and were much impressed with his appearance. I shall never look at the planet again with the naked eye but in imagination I will see his satellites grouped about him. After this we looked at the telescope and transit instruments, but the short time we stayed was not enough to fully acquaint us with the working of both. We did a good deal of talking on astronomy, and Mr. Burckhalter pointed out the position of some of the stars for us. All he said was very interesting. While feeling strongly the fascination and sublimity of the science of astronomy, he is nevertheless very practical. He told us an amazing story about the star Vega, which is supposed to be a young, vigorous sun. To him it is one of the most beautiful objects in the heavens; what was his indignation on being told once by a "smart young man," whose hair was plastered in a curve down on his forehead, that Vega—lovely Vega—looked like a ham sandwich as seen through a telescope! It was too much for Mr. Burckhalter's equanimity; he exploded, to the utter discomfiture of the smart young fellow.

Astronomy has always been a fascinating study to me. But until I looked with the aid of the telescope's powerful eye at some of the objects in the heavens, I never fully realized the majesty and beauty of the science. I do not wonder that astronomers are content

"Through the long night hours while we rest
To read the history of the skies."

I can understand how one could forget for a time all about earthly things while contemplating the sublime spectacle that night discloses to us.

"The heavens bend to us as the night comes down."
S. F., June 23, 1887. F. H. A.

Beardless Barley.

EDITORS PRESS:—In your issue of May 21st, I find a short article in regard to "Beardless Barley," and wishing to have a clearer understanding myself, as well as for others, in regard to the two barleys that resemble each other so closely, I will forward to you today, by Wells, Fargo & Co.'s express, a small bunch of each. The "beardless," as we call it here, is a fine barley for farmers to raise for hay, equally as good as the "bald," and one great advantage it has over "bald" is this: that if you do not wish it for hay or only a portion of it, the remainder can be harvested for grain. It cannot be distinguished from bearded barley when thrashed and cleaned, and we have no beads to contend with. Another great advantage, it does not curl or crumple down as does the bearded barley. The seed we have come from the South here, and I do not think the Agricultural Department ever distributed any of the seed on this coast, or not to my knowledge, as it did the "bald barley." On examining them closely you will find the "bald" barley will hull clear of any covering as does wheat; the "beardless" does not, but is just the same as bearded barley. I hope the bunches will arrive in good condition, and that you will give us some more light on the subject.

Lathrop, Cal.

C. LITCHFIELD.

[Our correspondent is correct in his statements and we are not sure but some confusion has crept into the mentions which the subject has had in the RURAL. There are beardless or awnless barleys which have a kernel covered, as common barley is, and there are beardless or awnless barleys which have a naked kernel. The latter is the one usually known as "bald barley," which is now quite widely known as a good hay grain, and which was distributed by the University several years ago. The University collection has beardless barleys with covered kernels, and one two-rowed variety, named by Mr. Klee "Berkeley hybrid barley," originated on the University grounds, and is very promising. The sample sent by Mr. Litchfield is a handsome six-rowed beardless variety which must prove very valuable in the way he describes. We would like to hear from him fully as to its origin, growth, bearing quality, etc.—EDS. PRESS.]

"Simple Truth His Highest Skill."

EDITORS PRESS:—I think it would be well to suggest to some, who are writing up favorable descriptions of California, that there is danger of doing harm by exaggeration. It is a fault altogether too common, and I know that confidence is often forfeited thereby. Beside the exaggeration that consists in statements which are partly true and partly false, there is a way of so weaving together certain favorable facts as to leave out of sight other equally pertinent but unfavorable ones, and doing it so skillfully as to leave the impression that what is given covers the whole ground. Some descriptions of the climate, soil and productions of California are the most perfect specimens of this form of misrepresentation that I have ever noticed. I could admire the talent were it rightly used,

but I do not believe in using the truth to make false impressions.

Beside these I have seen statements in reference to my own section, touching its most important interests, that I know to be thoroughly false. Whether made through ignorance or intention I cannot say. While I would like to see our State reap all the benefits of a deserved good reputation, I would not like to see it stand upon a fictitious one.

Some of the efforts to secure the attention of Eastern land-seekers remind me of the story of the man who, in trying to accustom his saddle-horse to meet surprises properly, directed his boy to go and secrete himself by the roadside till he should ride along, and then jump up and shout "Boo!" The program was carried out, but the rider was thrown; whereupon, gathering himself out of the dust and getting his breath, he exclaimed: "My son, you said 'boo' too much!"

I think some of these writers say "boo" too much.

THOUGHTOGRAPH.

THE DAIRY.

Cleanliness in Dairy Utensils, Food and Surroundings.

EDITORS PRESS:—Can you inform me of the best article to wash milkcans with, so as to have them sweet and clean and keep milk a reasonable time? Some say, "Sal-soda is best;" others say, "Don't use sal-soda, as it will leave a sediment on the tin which will sour milk every time." A reply through your paper will very much oblige—A BEGINNER, Los Angeles.

Sal-soda or any strong alkali will cut the grease or oil in milk and cleanse the can, but it is very important to thoroughly rinse the can in clean water, in order that all of the soda is removed. The effect of soda left in the can, as a sediment or fine powder, is that it unites with the fatty portion of the milk and forms a soap which is highly obnoxious to the taste and smell, though not sour.

Soap, both hard and soft, is mainly used for can-washing; while soft soap is used principally by the largest milkmen, for the reason that they make it themselves, from the refuse grease of their places, and because it is more convenient to work into a strong suds and its strength and effectiveness are better gauged by the maker, as well as being less expensive.

If milk curdles and is yet sweet, it is a sure sign that the leaven of old decaying milk has not been thoroughly washed from the can, and it will sour very soon after curdling.

It is claimed that milk from alfalfa—hay or grass—will not keep nearly so long as that made from other feed, excepting, of course, milk made from brewers' and distillery slops, or the refuse from the kitchens and wharves of the city. In a city like San Francisco there is always a large quantity of decaying hay, potatoes, turnips, beets, pumpkins and grain damaged by water, as well as much other vegetable matter, that either goes to the cows or hogs, which will naturally keep the stomach of a cow in a state of ferment. So much cheap food of this nature is the reason why so many cows are kept within the city limits. One would naturally suppose that it would cost more to keep a cow in the city than in the country, but the reverse is true. The city assessors' returns for the present year show over 7000 cows, while perhaps 10,000 would be nearer the mark if all were found. The milk from these cows must be in many cases unwholesome, considering their feed, water, want of exercise and foul air. This milk will not keep nearly so long as good, sound country milk; but this is not important, as the milk is only a short distance from the consumer, and the cows are milked at an hour that will insure sweet milk, no matter how filthy the yards, utensils, water and food from which it comes.

From a late examination made into the matter of the milk supply of San Francisco, it was found that a large number of the cows were using the water from wells sunk in the lowest portion of the milkyards, where the drainage from the filth of the whole yard concentrated into the wells, and where the same water was used for washing the utensils, watering the milk, and for cooking purposes. These places were generally conducted by ignorant foreigners that leased small places between the sandhills, and with a few dollars' worth of improvements, were enabled, in their squalid filth and brutal economy, to compete for the milk trade of the city successfully.

All the animal heat must be driven from milk as soon as possible after drawing it, to have it keep well. Milk should not be exposed to the atmosphere more than absolutely necessary, as the floating bacteria find it the very best material in which to propagate their kind.

Cleaning Appliances.

The main essentials for cleaning milk-vessels are strong, hot soapsuds (kept hot until through with the work), and enough of it, so that the suds do not become foul. Then hot, clean rinsing water to carry off the soap and dirt; and then boiling hot water to scald with, in a receptacle deep enough to cover the entire can, which should then be hung up and exposed to the sun for 24 hours before using again.

Uncleanly Milk Again.

We have touched on this city's milk supply more, perhaps, than the query at the opening of this article justifies, but we do not consider an apology necessary in trying to abate one of the

most grievous and serious evils existing now as a constant menace to the lives and health of our citizens.

Much depends upon the press of the country as well as city, in preventing illegitimate and fraudulent methods of gain from being successful. Our work is largely with the agriculturist whose dairy interest is assailed by a fraudulent imposition upon the public of a cheap, unwholesome, and nasty article sold as milk, to the great detriment of a large city; and if we can transfer those 10,000 unhealthy cows from the filthy slums of the city to green pastures and wholesome feed in the country, we shall feel that we have not only saved the lives of thousands of innocent and helpless children, but have placed the production of milk where the Creator intended it, and where our friends, the agriculturists, will have a good market for all their produce at home, in the production of a health-giving milk.

This business of supplying the city with milk belongs to the country farmers within, say, 30 miles of San Francisco, and not a drop of it should be made in San Francisco. The milk of 10,000 cows, say two gallons each or 20,000 gallons now made in the city daily, if in country milk would be worth about 15 cents per gallon on the farm, or a total value to the farmers of \$1,095,000 annually—a sum that would give employment to a large number of respectable families and build up the surrounding country with respectable homes, in the interest of good society.

The best appliance for washing is a range of square tubs made of boiler iron, say 10 feet long, 3 feet wide and 20 inches deep, made into three or four compartments and located over a furnace with the flue running underneath lengthwise. The water directly over the furnace would be boiling while at the other extremity it would not be too hot to handle. Nothing but stiff brushes should be used in washing; cloths or sponges become foul and cannot be cleansed readily.

Most milkmen use but one large round kettle over a stove frame in which all the water used is heated, and that used for washing transferred to tubs from time to time, while the scalding is done in the large kettle in the remaining hot water. This process is faulty, because the water in the tubs gets cold and greasy before the cans are all washed.

A good can-washer gets much higher wages than the ordinary milkster, for the reason that the business requires very thorough, regular and honest work.

Such large dairies as the Jersey Farm Dairy and a few others do all their washing with brushes revolved by machinery, which is at all times thorough and quite economical in a large business, where many hundreds of cans are washed daily.

An income of, say, \$1,000,000 annually to the farmers means a good living to 400 farmers with their families, or \$2500 each, for the produce of 25 cows in milk all the time; which means, also, that they will require at least four animals, young and old, to each cow in milk, or 100 head. These will require again about 300 acres of good land, or 400 to 600 of ordinary land; or, in other words, the 400 farmers required to furnish 20,000 gallons of milk daily would need, say, 300 acres each, or 120,000 acres of fair land, upon which their hay, grain and grass could all be raised, besides some horses, hogs, chickens and family supplies. Quite likely, too, they would grow some high-bred horned stock, which could be turned off annually and by which the revenue could be raised to perhaps \$4000 yearly. Taking the average family to be five persons, and the help of three farm hands in addition, and you have ample provision for 3200 persons respectably paid, housed and fed, by transferring the milk business from the slums of the city to the country.

We are pleased that this inquiry about milk has called up the points we have made. We desire to speak on this question, especially in relation to the city supply, as often as we can, and the country as well as the city press cannot put their columns to better use than in agitating this question energetically until a reform is brought about, by driving out the city milk and introducing a wholesome article from the country. Spurious butter has gone; spurious wine is going, and why not save our children by driving out spurious milk?

SHEEP AND WOOL.

The Mohair Industry.

EDITORS PRESS:—During the season of 1886 this industry has been depressed, mohair was low; the growers had reason to be discouraged, as the industry has been very uncertain. Now let us look at the past and the present, and may be we can learn therefrom what the future will be.

We have added in the United States to the few establishments of former years until we now have 39 factories using mohair in different ways, but the domestic mohair only furnished about one-sixth, while Turkey mohair furnished all the balance of our consumption. The low tariff on Turkish and Cape mohair is against us; besides that, the unprecedented clips of 1886, both from Turkey and the Cape, as shown hereafter, reduced prices considerably.

If our tariff should be fixed permanently to

THE VINEYARD.

Herbaceous Grafting.

The following circular of instructions to the inspectors and officers of the Board of State Viticultural Commissioners has just been issued:

Herbaceous grafting, as applied to the vine,

opened a new and short way to the establishment of resistant vineyards, as well as affording improved facilities for changing objectionable varieties to others of better quality.

The many novel methods of grafting the vine which have been proposed of late years, and their common failure in practice, have led me to believe that such announcements as that of our esteemed contemporary, Hermann Goethe, must undergo a certain practical test in the vineyards of this State before being generally accepted as fully adapted to our climate.

Fig. 2.

growers as they proceed; advantages which, if the method prove successful in California, our vineyardists cannot afford to be long without.

Believing that the method must depend to a large extent on the care and accuracy with which such delicate work is executed, I have illustrated fully the operation in Figs. 1, 2 and 3; these, if followed closely with a careful study of the following text, will, according to our friend Hermann Goethe, lead to success.

The period chosen for performing the operations is of the greatest importance. The most propitious epoch found in Hungary ends about the middle of July. As our vines put forth earlier and are now further advanced, it may be plainly seen that there is no time to lose. The information here reproduced came to me so late that instructions could not be issued sooner. In consideration of this fact it is to be hoped that the experiments will be performed immediately and that our experimenters may be particularly careful to use only delicate and rapidly growing shoots for both scion and subject. (The term "subject" is applied to the cane into which the scion is inserted.)

Experiments in this work have already been begun by me with fair indications of success, but it is still too early to judge their value.

To operate, choose that period in the growth of the vine when the shoots show daily advancement, selecting the most vigorous canes for the purpose. The union should be made at a point on the green shoot, so near to the growing end as to exhibit no white pith when cut. In fact, that part of the cane in which the pith is scarcely distinguishable from the wood and bark is the surest to unite with the scion. It must, however, be strong enough when wound to maintain the scion well in position.

Fig. 2 exhibits the graft when complete—natural size. Fig. 1 shows the parts enlarged. The last of June has been generally selected for the work, although some work performed the 1st of July has shown a loss of only two per cent. When late spring frosts prevail a later period is chosen, as the rapid growth then comes later. This graft cannot be made to succeed on canes attaining a woody appearance, but both scion and subject must be elastic and yet not too soft.

The bud on the scion at *b*, Fig. 1, must be examined and found good, and in selecting the scion it is generally safe to choose that bud at the base of the first well-opened leaf found on the growing cane. Lower and more woody scions will not answer. Laterals which show slow growth will not answer for the subject, but may be selected if still growing vigorously. The original canes proceeding direct from old spurs are most commonly selected for the subjects, particularly those which show a bright, sappy appearance.

Warm growing weather favors much herbaceous grafting. A cold wind is harmful in checking growth, likewise a dry hot wind, and it is well in hot weather to suspend operations during a few hours in the middle of the day.

Do not graft vines showing a sickly appearance.

The preparation of the scion is clearly shown in the cuts, only be careful to preserve the scions fresh. If necessary to keep them some time, place them in water, thoroughly shaking off the water at time of grafting. Let the cut of the lower end of the scion (*a*, Fig. 1) be made through the bud that the point of the wedge may possess the enlargement necessary to fit the base of the cut in the subject as shown at *c*. The knife in entering the subject should split it just through the middle and descend half-way through the center of the enlarged part *c*, Fig. 1. Let the size of the scion be near that of the subject, never larger. The leaf joining the bud of the scion at *b*, Fig. 1, should be cut off, leaving the stem as shown in the cut.

In inserting the scion, see that the bark of the two parts come smoothly at the points and that the tender bark is not broken or slipped. A safe precaution is to spread apart the subject when pushing home the scion.

To tie the graft, use a cotton string; begin to wind at the top, and, by drawing it close and tight at the bottom near the bud, you will prevent the scions being forced from place.

This done, six or eight days will determine the measure of your success. By this time the scion bud should have begun to grow, following which all suckers and laterals drawing from the cane on which the graft is placed should be carefully removed, and this latter operation repeated as often as may be required to force all growth to the new part.

The success of the graft is early indicated by the falling off the leaf-stem which was allowed to remain on the scion. As the union grows the string must be loosened. The short time necessary to determine the success of this method gives ample opportunity to repeat the operation several times during the season, if success does not attend the first efforts.

Grafts made on growing canes of riparia vines two years old have shown good results, though older vines are equally good. Fig. 3 shows an old riparia vine grafted on its growing parts at *a*, thus producing resistant grafted cuttings well united above to a better variety, which may be planted in the new vineyard the following spring or layered and rooted as shown by the dotted line.

Many other advantages growing out of this method will be explained later if we can determine the success promised by Prof. Goethe. In the meantime we call upon you to experiment carefully and forward your results as early as possible. JOHN H. WHEELER, Chief Executive Viticultural Officer.

Fig. 1.

Fig. 3.

HUNGARIAN METHOD OF HERBACEOUS VINE GRAFTING ILLUSTRATED.

consists in grafting on the growing wood in midsummer. It is a method which has been known for 50 years past in Central and Eastern Europe, and has recently become common in the region of Hungary. So valuable has the method here described been found, that during the past year Von Hermann Goethe, director of the Royal School of Viticulture at Marburg, has issued a work largely devoted to the subject. Other and more common systems are treated by Professor Goethe, but preference is given to the above-named method in that it has

Before, therefore, proceeding to announce to our vine-growers the value of herbaceous grafting, I have thought proper to ask our inspectors and others working with us to this year make a test of the method described in the following—so far, at least, as the lateness of the season may permit—and transmit to this board the results of their experiments, that another season may find us able to adopt or discard the system altogether.

The many advantages obtained from its use, if successful, will become evident to our vine-

foster, uphold and protect our home product, it would also encourage our manufacturers to buy at home first all that quality of mohair suited to their wants and purposes, therefore benefit both classes of producers and manufacturers. The uncertain condition of tariff keeps our own mill-owners out of the markets, except for immediate use upon orders or standard goods in constant demand.

The reports show the Turkish and Cape mohair imported into England during six years preceding and up to 1885 was 55,802 bales per year. In 1886 the import reached 76,690 bales, being an increase of 20,888 bales, equal at 220 pounds per bale, of 4,595,360 pounds over the yearly average of the past six years; this increase alone is 12 times the quantity of the domestic mohair of 1886 consumed in the United States.

The consumption of mohair in this country in 1886 is reported as follows: Foreign, 1,915,694 pounds; domestic, 355,373; total, 2,271,067 pounds.

Now as to the English trade and consumption of mohair in 1886, the reports say: The prices ruling low, manufacturers have been using mohair for new purposes to such an extent that at the end of the year the quantity on hand was considerably less than at the end of 1885.

This together shows clearly, and it must be admitted, that the consumption of mohair in different ways of manufacturing in the United States and England is increasing faster than the production of the raw fiber in the different parts of the world. If the Government will protect our industry, we can use a large territory now valueless for profitable business in raising Angora goats and build up our country. We can spread out here while Asia Minor cannot, and the only real competitor in the future of mohair growing will be Cape Colony.

It is claimed that some flocks at the Cape are comparing well to the best in the world, and that those engaged in the business are prospering. According to report of U. S. Consul-General G. H. Heap, published by Fink & Co. at Leon Springs, Texas, last fall, there were paid at auction at the Cape, for bucks, average price of \$447 50 per head; for ewes, average price of \$267 per head, showing their faith in the business.

Wm. Macnaughtan's Sons, under date of April 5th last, stated in their circular to mohair-growers that, owing to severity of the winter and the scarcity of water, Angora goats were suffering in Asia Minor, and the report goes on to state that the clip this season will not be up to the average of quality or quantity.

This report is in part confirmed by the fact of a famine now reported in Asia Minor, the Sultan having provided for measures of relief to the sufferers on June 22. As the Turkey-Russian war has been in progress, and an extremely severe winter has followed, the goats have probably become reduced or perished, and in that case mohair will again advance to correspond to the demand, and the outlook for this industry, therefore, is at present more hopeful than ever before.

The Registry.

To advance the material interests of goat-breeders, the matter of establishing a registry demands our consideration. The American Mohair-Growers' Association at San Antonio, Texas, organized and adopted rules and regulations for establishment of a register of Angora goats pure bred as Class 1, and graded as Class 2. The standard excellence is 50 points. Those entitled to registry shall score 30 to 40 points for Class 2, and 40 to 50 points for Class 1. Class 1 shall be the pure blood, Class 2 the grades.

The aim of the 2d Class or grade register is based upon the opinion held by many breeders that in proper localities, and by proper care, our grades are advancing very fast, in producing long, fine and lustrous mohair, and that under continuous good management the time will soon be that there will be no visible difference in the mohair product of pure bloods and grades.

For the benefit of grade-breeders who have the faith and the energy to advance their stock, the registry of Class 2 provides the system by which their labors can be fully tested and proven, and the cause of the industry be helped along.

No one can deny that the breeding of any stock to registered males gives better satisfaction than to those not registered, because certain points of excellence in the young can be established only by the use of selected males having those points of excellence bred into them, and a warranty for excellence can only be based upon a record and a registry. For the best of the industry, this question of registry should be discussed at the next annual meeting of the California Angora Goat-Breeders' Association on the last Thursday of the State Fair at Sacramento, and it will be of importance that the members all attend. All other breeders are hereby invited to join us, and be with us at Sacramento, hoping that the plans determined upon will be for the benefit of all concerned and the State at large.

JULIUS WEYAND,

Sec. Angora Goat Breeders' Association.
Colusa, June 25, 1887.

It has hitherto been supposed that the highest mountain in the world was Mount Everest, one of the Himalayan range, 29,000 feet high; but this honor is now claimed for Mount Hercules in New Guinea, which soars to the tremendous altitude of 32,786 feet, or five times that of Mount Washington in New Hampshire.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

In and About Sacramento.

EDITORS PRESS:—A visitor passing through our city can always find some general improvements to note. A stroll from Front street up the R-street railroad to the outer limits of the city shows the boom has advanced.

Passing up on the south side of the levee, we notice extensive vegetable gardens, run by Portuguese mainly, which supply the wholesale merchants at various points eastward, and ship direct to Eastern firms, especially potatoes. The soil is a dark, rich loam, which is kept composted with material drawn daily from the city, and irrigated by steam-power.

Along the eastern side, within the limits, property has gone up and nice cottages of latest style and suitable for family use are being erected, gardens and green plats surrounding.

At Twentieth street is the old Richmond park, fitted up for pleasure-parties and recreation. At Twenty-second street Mr. M. S. Nevis' new winery is drawing to completion upon the ground where the former was destroyed by fire some years ago. The building is of brick, large and commodious, with a number of wings, and well ventilated. His present winery, on Twentieth, P and Q streets, also of brick, is full of last year's wine, and not sufficiently roomy for his business. Sales are good here and East.

At Twenty-eighth street there is being erected, on the block known as Snow-Flake park, a large stand for the use of the Sacramento base-ball club. This widespread national craze will have its run among the younger class of humanity similar to the skating-rink; then something new will be developed and run its length.

Sunday was a general christening of the park. Trains came in from different points, making the day appear like some legal holiday, rather than the quiet sabbath of New England times. It draws from the church, Sunday schools and Y. M. C. A. with corrupting influences. The wine and beer is passed from hand to hand, and profane language uttered in the busy competition with opponents, bringing shame on the heads of families who allow their sons to be drawn into the paths of sin and vice in this Christian and enlightened land.

Above Thirty-first near Gatheries street is Kohler & Van Bergen's winery, also a building erected especially for the making of concentrated grape must. They use grapes from the Natoma vineyard at Folsom and other points.

On the line of rail above the Homestead is the new fine edifice of Robert Williamson, of the firm of Strong & Williamson. At present that gentleman is at the South enjoying recreation as well as pursuing business in his line. The firm at this point has a fine orchard and nursery interspersed with small fruits.

He irrigates by steam-power, running four pumps in reservoir, whence water is carried by pipes underground to various points. He cultivates after irrigating, keeping the ground loose and free from weeds.

Real estate from here to Brighton will be cut up into small parcels, and, under the management of the Sacramento Improvement Association, sold for country homes, whence business men may take the local train daily for their business center.

Along the line from Brighton to Folsom, fine orchards and grain lands lie on both sides. Among the fruitists are Dr. W. S. Manlove, R. D. Stevens, Lubin, Russell, Routier, and many others whose orchards, grown without irrigation, lie along the American river.

Then comes the large Natoma vineyard in the vicinity of Folsom. Throughout this region way stations are built for the accommodation of fruit-shippers and wayside passengers. The morning and evening local trains—a new feature—are very acceptable to the traveling public.

Farmers coming in at the Grange quarters are feeling in better spirits since their grain has been thrashed and hay baled. The grain yields far better than at first expected, and at some points where the land is heavier and holds moisture the kernels are not so shrunken. The millers had previously engaged the crop in the field at a certain price, and may get cinched at present rates. Some think it will be better to hold on to the grain till fall, when better prices may rule the market.

As a larger acreage than usual was sown to grain, the hay crop will be short, and the demand and price are advancing, and all the hay brought into market is quickly taken up. The alfalfa stands are reported good and command a good price. Those who raise stock, pasture from it, and as the animals become marketable, they are brought in and sold. Some fine pastures are found along the Cosumnes river, following up the stream within the foothills; and owners are making money in the sale of stock.

When the farmers, fruit and stock-raisers do well, the merchant, mechanic and tradesman receive the benefit, and encouragement is felt in all branches, for their success lies in the hands of the producer.

Grange teachers have brought the tillers to a

higher standard than in former years, and they have become more advanced in the line of trade and business fact.

I learn from the Grange house that the trade for the past month is good. June trade is apt to be slack, as farmers generally are busy securing their crops, and but few come into the city. Other houses no doubt felt the pressure, but shipping orders in the interior of the State, Nevada and Utah are kept up as usual.

The grape outlook from various points is fair. Vineyards lying along the river-borders, with deep, loamy soils, are not so much hurt as on the red lands of the plains. The second crop of the Muscat is forming well and may make up to some extent for the first. On the plains some are taking the precaution of capping their vines with cloth or sacks, the cost of which will be well repaid in saving the crop from the heat, which may come in spells during this month and next. Where the vines grow long it is well to curl them round the sunny side, making a protection. Some trim early, then the side branches and leaves grow out, forming a closer shade. Still, if not well protected, better cap them.

The hop crop is advancing. Early in the season growers complained of the cold snap; but since the weather has become more genial the prospect is good, both as to quality and price.

The managers of the State Agricultural Society are moving in all directions to make the approaching fair a success. Supervisors of the various counties are interviewed to get their aid, and all classes who feel the importance of supporting so good a cause, and showing up the products of the land, will come prepared to fill up the space set aside for them.

Our county has a committee of three from the Grange to work up the interest of Pomona's department. Aid them, all who can. Do it to the extent of your ability, in what you have.

The upper Stockton road took the initiative last year in sprinkling, and the lower Stockton has taken steps of late to go and do likewise. All who market fruit find it a great improvement over its former state, and fruiterers residing at Florin come forward and help to cover the expenses. Both roads will find a great benefit from the outlay. Sacramento county should not be behind in having good roads.

Let the boom extend throughout the State, taking in all points that will build up, and increase our population from the large immigration coming, and success will be ours ultimately.

To-day patriotism is at a fervent heat. The city is gaily dressed and its streets filled with America's sons and daughters, and comers from all lands, commemorating the sires of '76.

Sacramento, Cal., July 4th.

G. T. R.

Why a Farmer Should be a Patron.

The *American Grange Bulletin* has been publishing a series of short articles under the above title to assist its readers in securing new members. Here are some of the reasons advanced why a farmer should be a Patron:

Because if merchants, lawyers, doctors, preachers, teachers, workmen, and all other classes, can be benefited through an organization in their own interests, so can the farmer. If they thus become better posted about their own business, so can the farmer. If they thus are better able to protect all their rights and interests, so can the farmer. If they can thus secure legislation in their own behalf, so can the farmer. If they can thus receive benefits—educational, social and financial—so can the farmer. An individual farmer is able, to a certain extent, to advance and protect his own interests, but "strength united is made stronger." A farmer can "paddle his own canoe," but it is a slow way of traveling in these days of floating palaces and ocean steamers. A farmer can, with axe, spade and pick, cut his own road to market, but united strength builds the railroad. A farmer can worship God or educate his children in his own house, but united strength builds the church and schoolhouse. A farmer can, like the barons of old, protect his own castle from those who would pillage and destroy, but united strength raises the strong arm of the law in his defense. Everything of any importance, every great undertaking, in these days, is accomplished through united strength. Let the farmer, then, who in numbers exceed all other classes combined, adopt this long-tried and proven plan; let him no longer fight his battles single-handed and alone; let him unite his strength with his neighbors', and they with the other farmers of the county, then with those of the State and Nation; and this great class, that feeds and sustains all other classes and callings, will not only protect and advance its own interests, but build up all others, even the Nation itself; for all history teaches that just in the proportion that agriculture is protected or depressed does the Nation advance or decline.

YUBA CITY GRANGE was sued some time ago, by Milton McWhorter of the Marysville Democrat, for an alleged libel contained in a resolution adopted by the Grange. The case was recently dismissed, and costs assessed to plaintiff, and on the 30th ult. the Grange levied an attachment for \$125, the amount of costs, and a creditor also attached for the amount of a judgment, \$300. A mortgage for \$1700 was also unsatisfied, and the paper has suspended publication.

The Order in New England.

The Worthy Lecturer of the National Grange makes a mission leaflet out of the following extract from "one of the largest city papers out West." It shows how the Grange has won respect and appreciation all over the country:

The New England farmers are undoubtedly the most enterprising and energetic of the Granger fraternity on this continent, comparing well in progressive spirit and action with their ingenious brethren in other respects. They cultivate the least productive natural soils, combat with the most rigorous climate, and yet by dint of industry and skill their labors annually produce the most liberal returns. The science of farming is well respected and followed in "Yankee Land" from Nova Scotia to New York. Agricultural societies and institutes and Granges are well distributed and generously supported. The local press of Maine, Massachusetts and other New England States bears evidence of the earnest zeal with which the farmer and horticulturist pursue their honorable calling. They look into the rationale of every department of their industry, whether they are devoted to vegetable production or animal thrift. There are now about 40,000 members of the Grange organization in the New England States alone, and these are earnestly devoted to agricultural improvement and not merely to factional advancement. More progress was made by them in 1886 than during several preceding years. They favor tariff reform, but believe in dividing the "reform" among other fraternities as well as the farmers. They have 750 reading circles who are studying political economy and other kindred subjects, and can give a reason for the faith within them. They repudiate the theories of Henry George about land, and win the rights due to labor by manual exertion. In fact, New Englanders have demonstrated themselves "the salt of the earth" in all that pertains to essential progress.

Eden Grange.

The *Haywards Journal* of last week mentions that Eden Grange is rapidly increasing in membership, and applications to join are pouring in from all sides. Saturday, June 25th, the fourth degree was conferred on three young people—Fred Russell, Amelia Gading and Miss Cowing. There were a number of distinguished Patrons present from outside Granges, and the meeting was one of the largest yet held by this Grange. Then followed a feast, and afterward the orators had the floor; but the most exciting part of the proceedings was a renewal of the debate on "Woman Suffrage."

The benefit concert tendered the Grange in Oakes' hall the same evening by Miss Roxie Dennis of Mount Eden, assisted by Miss Ellen Coursen and others of S. F., was well attended. All of the selections rendered were highly enjoyed. The audience appeared to be in an applauding mood, and every warbler received an enthusiastic recall. At the close of the concert the floor was cleared and dancing indulged in until midnight.

A PATRON AT HOME.—The Creston correspondent of the San Luis Obispo *Tribune* begins to speak of Brother Webster, and then goes off about the g. c. as follows: Hon. J. V. Webster is here on his sweet home ranch. He has laid aside the purple and fine linen and donned the rancher's garb of shirt and overalls. He is busy at work in his young orchard shortening the monstrous growth of limb that the trees were developing. He was fearful if they were not taken in hand right off, that they would attain such a height by another season that he would have to send to France for the flying balloon, and thereby have a vehicle wherewith to gather the fruits. There is no doubt that in the course of time, if trees and vines continue to make such rapid growth as they are doing in this wonderful climate of ours, there will have to be a line of fruit-packing establishments built between here and the moon, and a line of aerial ships run between the two points, to supply the Moonites with the delicious fruits of California.

PREPARING FOR STATE GRANGE.—At the last meeting of the fruit-growers at Santa Rosa, President Whitaker expressed the opinion that it was a reasonable time to take into consideration the State Grange meeting to be held in that city in October. He thought it would be proper for the association to assist the local Grange in making a display of the products of the county. The suggestion was approved by the association, and on motion of Mr. Roberts a committee, consisting of L. F. Chinn, N. G. Finley, A. F. White, E. H. Smith and J. Roberts, was appointed to make arrangements for the occasion.

THE Grangers about Placerville. The *Republican* says, are astir to get all the El Dorado people united in making a county exhibit at the State Fair this fall. It is proposed to appoint committees in different parts of the county to secure exhibits and stir up interest. The plan will be of general benefit to everybody in the county, and there should be no lack of contributions to aid it.

DANVILLE GRANGE lately conferred the fourth degree upon a class of 12, and at last accounts was preparing to initiate a class of five.

Grange Work and Progress.

(Prepared Weekly by M. WHITEHEAD, National Lecturer.)

The recent decision of the Supreme Court of the United States, pronouncing valid the famous driven-well patent of Nelson W. Green, is attracting much attention, and farmers, who most of all are interested in the matter, where literally, millions to be paid by them are at stake, should study the subject, and then unite with their brother farmers in securing the just amendments to the patent laws that have been asked for by the Grange these many years. It is hinted also that these late decisions, which reverse those of the lower courts, have not been fairly obtained. One good authority says: "It is to be feared that these decisions have been made without full knowledge by the court of the facts in the case, and that in the case upon which the decision was rendered, the opponents of the driven-well patent either neglected, or were not permitted to present the full evidence which exists."

Again this charge is made and should be thought about: "The Supreme Court decision which has just been rendered suggests the possibility of a prearranged case, from the fact that W. D. Andrews, a respondent in the case under which the decision was rendered—Harris Eames vs. W. D. Andrews et al.—was the complainant with Col. Green in the case decided adversely to the validity of the patent in 1883 by Judge Shiras of the United States Circuit Court in Iowa. The full testimony in this latter case—Andrews et al. vs. George Hovey—constitutes the evidence upon which farmers and other users of driven wells must rely for protection against the exactions of agents of the Green combination. The practice of making arrangements for half-way defenses in cases of alleged infringement, which operated with such notable results in favor of the Bell Telephone Co. in its manifold litigations, has not been lost sight of by the driven-well patentees. In numerous instances, and largely through a United States Judge in Southern New York, they have secured favorable decisions upon evidence that must be regarded as evasive and incomplete. Coming thus fortified before the Supreme Court, the way to a driven-well monopoly has been quickly cleared for these schemers."

"The Iowa case, with its mass of conclusive and uncontradicted testimony against the right of patent in driven wells, and the lucid opinion of Judge Shiras, must have been sedulously concealed from the notice of the Supreme Court Judges. It is difficult to imagine how otherwise a decision could have been rendered which gives to a few men power to harass and annoy the farmers of those large sections of the country where driven wells furnish almost the only source of water supply for domestic use."

THOUGHTS ON ORGANIZATIONS.—Farmers are going into some kind of an organization, and Patrons of Husbandry should make strong efforts to have them organize upon the immovable foundation of the true principles of the Grange, with the righteous, laudable purposes of the Order as the end to be accomplished. There are other organizations of farmers besides the Grange; and while we would not attempt to detract in the least from their value to the agricultural interests of our country, yet we, as Patrons, believe that there is none so good as the Order to which we belong; and believing thus, we should show our faith by our efforts to get those farmers, who are ready for organization, to come into the Grange. Farmers are engaged in the same ancient, honorable, honest occupation; their interests are one and the same; their enemies are united, cunning, strong and common; then it is plainly evident that farmers should guard their interests by organizing into one compact body, and concentrate their efforts to accomplish the same grand purpose. There is no need of or room for division, even in name.—*Roanoke Patron*.

FOR awakening thought and arousing the farmers to action upon the great questions of the day—those which never could have been reached in any other way—the Grange has made additional proof of the idea that our education is by no means entirely a product of organized schools, or employed teachers and printed books. While they occupy a very important part, they are not all that act on our powers to develop them. "Life is one grand school, and its every circumstance a teacher." The Grange, with its beautiful and practical lessons, has power to raise men and women from the humblest walks of life to positions of influence and power.—*A. J. Rose, Master Texas State Grange*.

MANY pass through life without a consciousness of where there are, and what they are doing. They gaze on whatever lies directly before them, "in fond amusement lost." Human life is a watch-tower. It is the clear purpose of God that every one—the young especially—should take their stand on this tower. Look, listen, learn, wherever you go; wherever you tarry, something is always transpiring to reward your attention. The Grange is a great educator, and teaches us to see new beauties in nature and to take a broader and better view of life.

SUGGESTION FOR THE GOOD OF THE ORDER.—I think that a carefully arranged literary program, with a diversity of subjects in the course of the year, is productive of about as much real good as anything, as in this way all are encouraged to speak and think more upon such things as they are personally interested in and receive new ideas from each other.—*Nellie Hussey, Sandy Stream, Unity, Maine*.

PROGRESS.—We have reorganized forty Granges this year. I think our next State Grange meeting in October will be the most interesting and instructive ever held in the State.—*Ava E. Page, Secretary Missouri State Grange*.

COUNTY DEPUTY-HOLWAY of Me. writes: "Skowhegan is taking in numbers, two to five each meeting. Athens 15 new applications last meeting, and more coming. Bingham 13 last meeting and more coming. Solon, or, North Somerset, is much

strengthened. East Madison and St. Albans doing some good work. I am now trying my luck with some of the dormant Granges. I have a petition for names at Pittsfield and Madison Bridge, and for a new Grange at Carratunk and Moose River."

"MANY of the Granges in the State are live, active, working Granges, and are advancing the interests, elevating the characters of their membership, and practicing the precepts of the Order, thereby accomplishing good."—*J. D. Clardy, Master Kentucky State Grange.*

If the souls of Patrons overflowed with tolerance, sympathy, charity and brotherly love, there would be no dormant Granges in this Union.

The prospects of the Grange in Indiana are brightening and a number of reorganizations are reported.

"CREEKVILLE, North Carolina, is in a very good farming section, and since the organization of the Grange it has added to the cultivation of both mind and soil. If the improvement continues for the next seven years as it has in the past seven, or people will not have to go elsewhere to find a good place to live."

"This is the age when thought is growing,
Fires of noble purpose glowing,
Streams of knowledge strongly flowing."

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

A LION IN THE WAY.—*Livermore Herald*, June 30: It has been supposed that the sport of hunting California lions had ceased to be one of the attractions of Livermore valley. Only last Saturday, however, one of these ferocious beasts of large size was shot on the Dublin road about four miles west of Livermore. Some one was driving along near the Devaney place, when he saw a large beast in the road in front of him. The animal trotted along in front of the wagon for half a mile, stopped and lay down beside the road. The team also stopped—people didn't care to drive by. Finally, Wm. Galway, with a shotgun, started after the lion on horseback. The beast started off on a sharp trot, turned into the grain, and squatted down. Galway rode up to within five paces and gave him both barrels. The animal was instantly killed.

Fresno.

EDITORS PRESS:—Most other sections have had their boom, and it is about time we were having ours. A number of real estate men have been visiting this section lately. Their report is very favorable. They think our county compares favorably with Los Angeles and other well-known districts. Several companies are endeavoring to buy large tracts of land in our immediate vicinity. The grain crop is good for the year—better than was expected. The fruit crop is very good. Our town has about 750 inhabitants and is rapidly increasing. Since the disastrous fire here last July, new brick buildings have taken the place of the frame ones that were destroyed, and it has now assumed quite a business-like aspect. It commands the major part of the mountain trade. The lumber yards of the Madera Flume and Trading Co. are connected with their mills in the mountains by a flume some 60 miles long. The mountain mill averages about 100,000 feet a day. A fine Masonic Temple will soon be erected. It has been very warm here for the last few days, the thermometer marking over 100° several times. Large fires have been raging in the mountains near by, doing some damage.—*J. R., Madera, July 1, 1887.*

CUTTING 'COTS.—*Expositor*, June 29: Some idea may be formed of the quantity of apricots raised in this section, when it is known that one firm alone has employed an average of 75 hands for the past two weeks simply splitting open the fruit and laying it on trays to dry. Each employe cuts from 8 to 12 boxes, of 50 lbs. each, per day.

Kern.

PROGRESS IN ANTELOPE VALLEY.—*Rosamond Cor. L. A. Herald*: Ernest Schrader, from Iowa, put in 10 acres of trees, vines, bulbs and garden stuff, to satisfy himself as to the productiveness and adaptability of the soil. He joined J. B. Titus, who also put in 10 acres just below him on the mesa half a mile east of this station, in sinking two wells, 24 feet deep, from which they pump by horse-power a three-inch stream for domestic and irrigation purposes. As they plowed and put in their land since the last rain, and were delayed in getting their pumps to work, they were fearful their entire plant would perish before the water could be got on. To their astonishment, however, not eight per cent of their plant failed to come up in good shape and is now doing handsomely, notwithstanding they have not yet irrigated one-fourth of the area planted. The figs on Mr. Titus' place are as large as an English walnut, while the trees are no larger than an ordinary cane. Both gentlemen are enthusiastic over their success. Their alfalfa has come up in good shape without any irrigation. The stand is thin, as is always the case the first year, but the stalks are from 6 to 12 inches in height, while the tap-root has a firm hold.

IRRIGATION SCHEME.—*Bakersfield Cor. Chronicle*, July 5: Parties owning about 30 sections in what is known as the "weed patch," lying east and north of Bakersfield, have just completed surveys for canals by which the flood waters of Kern river and Walker basin creek can be made serviceable for irrigating this large body of really fine land. Estimates based on

the surveys just completed show that the work will be much less expensive than originally supposed. There are two or more natural reservoirs, which can be made to hold flood water sufficient, and the water is had free of cost from Kern canyon. It will be piped high enough to cover the foothills between the river and the main body of land mentioned, and thence by canal. Under late decisions the flood waters of a stream are public property, and the proprietors of the lands have secured their claim to a share of the surplus water, and the land can be irrigated. The "weed patch" is in the thermal belt, and will produce all kinds of citrus fruits. The company is backed by Los Angeles capital, and proposes to commence work at once.

Los Angeles.

HONEY SHORT.—*Anaheim Gazette*: Herman Koster, who has a bee ranch in the canyon above the oil wells, reports that the honey crop will be small this year. The wild flowers and clover blossoms withered early, owing to the heat that has prevailed.

THE OSTRICHES AT WASHINGTON GARDEN.—*Los Angeles Herald*: One of the birds was plucked yesterday and another will probably undergo the ordeal to-day. It will be two months, however, before the majority of the feathers are in the required stage of fitness, and then the proprietors expect to reap a handsome revenue for their enterprise. The average gross receipts from each bird is \$300 every seven months, about 50 large plumes being obtained from the wings and about 12 ounces of body feathers. The incubator, manufactured at Petaluma, is in full blast, and in six weeks more a brood of chicks is expected. It is kept at a uniform temperature of 103 degrees, and as each fullgrown bird is worth about \$1000 there is no doubt that all possible vigilance is observed. As a curious fact about the ostrich's powers of abstemiousness, it is stated that one of the birds, at present on view, went without food during six weeks of its transit from Africa here.

THE GRAIN FIELDS.—*Los Angeles Express*, July 2: J. B. Lankershim of the L. A. Farming and Milling Co. says: So far as I know, Los Angeles county will do as well this year as any in the State, both as regards the quality and the quantity of its yield. Samples from the San Fernando ranch are very promising, but it is a little early to judge of the crop. . . . J. Loew of the Capitol Milling Co. remarks: I should estimate that the barley produced this year in Los Angeles county will be about 60 per cent of last year's crop, and wheat about the same ratio. Home consumption is just about double what it was a year ago, therefore the export will diminish in the same proportion. The quality of barley and wheat will be much better this year, both as regards weight and color; consequently better prices may be expected.

Modoc.

NOMADIC NUISANCES.—*Adin Argus*: Migratory stock is becoming a great annoyance to our stockmen and in fact to all the farmers of our county. It is an outrage to have the cattle, sheep, etc., of other counties feed on the ranges of our county and rob our taxpayers of the ranges they are beginning to greatly need. But how are we to get redress? Since the late decision of the Supreme Court it seems that all counties which have imposed migratory stock licenses did so illegally, and now we can feed foreign stock free of charge, save the owners the tax on their stock, and suffer the damages thus occurring without the interference of a migratory stock license.

SAGEBRUSH RYE.—*Elias Fletcher*, who owns a sagebrush ranch a few miles north of Alturas, brought to the *Independent* office, Saturday, some samples of rye, merely to show what can be done without irrigation. There were two stools of the grain, one of which contained 45 and the other 32 stalks—87 stalks from two kernels of grain. The rye was about four feet high and well headed. Mr. Fletcher sowed his grain last fall, and it has never had a drop of water except that which fell on it from the clouds.

Sacramento.

ALFALFA.—*Galt Gazette*: John Bandeen, five miles east of Galt, has a 20 acre field, bordering on Dry creek, seeded to alfalfa. The past year he has kept 200 head of hogs, 11 head of cattle and 5 horses on the product of this field alone. As proof that his stock has thriven, he takes pride in showing a fine two-year-old filly that weighs 1325 pounds. Alfalfa is a profitable crop, and can be raised in this section without irrigation.

San Bernardino.

APRICOTS.—*Riverside Press*, July 2: Dr. J. Jarvis has commenced harvesting his apricot crop, which will amount to 150 or 200 tons, from about 40 acres of orchard. The doctor will have about 30 tons of dried apricots, which, at 20 cents per pound, will give an income of \$12,000—or \$300 per acre, from which the cost of drying must of course be deducted. The doctor is taking out his Moorpark trees, as they do not bear satisfactory crops.

ORANGE AND RAISIN SHIPMENTS.—*Riverside Cor. Los Angeles Times*, June 29: The orange shipments for the season of 1887 are ended, and aggregate 376 carloads. The raisin shipments of the year ending June let will amount to 175 carloads, making the total of these two productions shipped from Riverside 551 carloads. Prices have ranged exceptionally high, and the total receipts are very satisfactory, notwithstanding the orange crop was not much

over two-thirds of what was anticipated early in the fall.

LIVELY TIMES AT THE CANNERY.—*Semi-Tropic*, June 30: Fruit continues to pour into the Colton cannery. This morning there was a large addition to the working force of the establishment. But fruit is coming in so rapidly and in such quantities that more help is wanted to care for it. It must be handled at once. The proprietors of the canneries are, therefore, anxious to have all who are in need of employment come to the factory to-morrow morning prepared for work.

San Joaquin.

NEW WHEAT.—*Independent*, July 3: New wheat is coming into the Stockton market in large quantities and of varying quality. Much of the new crop appears to be shrunken, which will make it No. 2 quality. The New Hope grain, however, is above the standard and some of it averages 62 pounds per bushel, but the general county average is said to be about 58 pounds. Smith & Wright bought a few weeks ago from Powell, Jordan & Hurd 700 tons of New Hope wheat, to be delivered as harvested. Yesterday 2000 bags of this crop were shipped from New Hope landing to S. F., and it is expected that the wheat will attract considerable attention at the bay, as it is large, plump and far better than average No. 1 grain. It is said to be a fair sample of the crop of the "Pocket."

Santa Barbara.

MUSTARD.—*Lompoc Record*, June 25: Mustard thrashing has begun on the Jonato rancho. There will be thrashed between 1500 and 2000 sacks from the present crop. The yield is estimated to be about eight sacks per acre. Mustard yields much better nearer the coast in the region of the fog belt.

Shasta.

THEY MEANT BUSINESS.—*Cor. Redding Free Press*: A few miles from where I write, some 30 months ago a new settler with a family of six and a couple of jaded nags, arrived and pitched his camp on a piece of as rough-looking, bushy red-land as could be found in the whole region. He simply knew it was vacant—vacant because nobody would have it. Strangers in a strange land, with no friend to counsel or aid them, they paid freight at the depot on a little miserable dunnage, hauled it out to their spot in the wilderness, and had just 60 cents left and nothing coming. What now? The saw came out of the wagon first, next the ax, and a load of wood is cut and hauled to town, and means raised to buy flour. Soon the brush came up, the trees fell, a field was inclosed, a cabin and barn, rude but serviceable, appear, and on that spot there is a handsome orchard of 25 acres, cleared and inclosed, two years old, beginning to bear fruit, and in two years more it will yield the family a handsome support.

Solano.

GOOD BARLEY.—*Suisun Republican*, July 1: The most prolific crop of barley we have heard of was grown upon the Hidden ranch by A. L. Reed. There were 100 acres in the field which averaged 26 sacks, and Hale & Danielson say it is the finest and heaviest barley they ever thrashed.

Stanislaus.

ALFALFA PASTURES.—*Modesto Herald*, June 30: J. H. Carpenter, a well known stock-raiser on the San Joaquin river, informs us that he has been compelled to remove 150 head of cattle to the alfalfa fields on the west side of the river, where the supply of feed is equal to all demands. Mr. Carpenter owns on the east bank of the San Joaquin river about 2500 acres of pasture land, the average quality of which is probably as good as any in the county in a state of nature. On this land, he informs us, he makes an allowance of six acres of pasture to each head of kine; but this year, owing to drought, that allowance is not sufficient, hence the necessity of removing a portion of his stock. On the irrigated alfalfa fields the allowance for pasture is one-fourth of an acre to each head of kine, or four head to the acre. Therefore one acre of irrigated land planted to alfalfa will furnish as much pasturage as 24 acres in natural grasses without irrigation.

Sutter.

THE CANNERY.—*Farmer*, July 1: Tuesday morning we made a call on this splendid Sutter county institution. We cannot give a detailed account of what we saw—the reader should go and see, and he will be greeted with one of the pleasantest sights he ever beheld. There were about 135 operatives at work, chiefly women, both young and old, and boys and girls of tender age, all busy as bees, and earning \$1 to \$1.65 a day. The cannery is running on apricots and has more than it can do; but this fruit will soon disappear, then peaches and other fruit will receive attention. The complete success attending this venture has stimulated the production of choice fruits and been the means of starting any number of new orchards; some of these coming into bearing this year has already demonstrated the lack of capacity of the cannery to handle the fruit. If the cannery pays expenses, it is to many of the operatives a positive blessing, as it utilizes all the available labor, teaches the young business habits, disburses annually several thousand dollars to our own people, and last, but not least, furnishes a ready market for our fruit. We say, enlarge the cannery.

COMBINED HARVESTERS.—There are now 18 combined harvesters in operation in Sutter county. The Shippee—Berg Bros., A. H. Wilbur, S. H. Graves, J. E. Plaskett, Eli

Davis, W. H. Parks, I. N. Brock and C. A. Glidden. The Houser—Hedger & Sons, Mar-cuse Bros., W. T. Wilson. The Beat—B. F. Walton, H. Walton, Jr., and Suel Harris. The Myer—W. T. Bevin. The Holt—Stafford Bros. All are working well and giving satisfaction, and cut, thrash and sack about 25 acres daily upon an average.

Tehama.

ORANGE ORCHARDS.—*Record-Union*, July 4: G. W. Hancock, who has just returned from the upper Sacramento valley, says that the results of planting citrus trees during the last year or two are most gratifying and successful. At General Cadwalader's, Red Bluff, there is a grove of 50 or 60 orange trees, set out since the first Citrus Fair was held here, and every tree has made a strong growth. There are shoots on all of them, of the present year's growth, from 1½ to 3 feet in length, and dark and thrifty in appearance. At Joseph Cones', about four miles east of Red Bluff in the edge of the foothills, can be seen about 75 orange trees, some of which are seven or eight years old, and are now loaded with young fruit. The trees look very fine.

Tulare.

JACK-RABBITS.—*Visalia Times*, June 30: R. T. Priest, a large farmer near Pixley, estimates that jack-rabbits are now destroying 1000 pounds of wheat per day for him. He keeps several greyhounds that kill from 20 to 50 rabbits per day, yet he sees no decrease in the pest. . . . Ranchers living along the Lakeside ditch and at the sink of Cross creek are rejoicing over the fact that an epidemic has broken out among the jack-rabbits in that section. The disease appears to affect them suddenly, when they fall over, make a few struggles and die. The banks of Cross creek and the Lakeside ditch are lined with thousands of dead rabbits. It is hoped the epidemic may spread over the entire country, as they are ravenous destroyers of grain.

A BIG RUNAWAY.—Twenty-two horses attached to the combined harvester of T. W. Johnson indulged in a runaway Monday, at the ranch of E. D. Maxon. The machine, which had been in use on Mr. Maxon's farm, was being removed. In crossing the road, just after leaving the ranch, the horses became frightened, and, being on hard ground, were enabled to pull the harvester at a rapid rate. The driver was thrown from his seat, but escaped uninjured; two of the animals were run over and killed, and five or six more were seriously injured. The harvester was not damaged to any great extent.

Yuba.

NICE LEMONS.—*Sutter Farmer*, July 1: While we were at the Immigration rooms in Marysville the other day, W. G. Murphy brought in about two dozen lemons grown in his yard near the Episcopal church. They were Sicily budded on orange stock, and seedlings, both of extraordinary size and quality and very thin rind compared to any lemons we have ever seen. Two of them measured 1½x12½ inches and 10x12 in circumference. Mr. M. cut one and squeezed the juice by hand into a measured druggist's glass, when it measured three and one-half ounces—a bulk almost as large as the fruit before it was cut—thus proving the thinness of the rind. Mr. Flint converted the same into delicious lemonade, which was tested and eulogized by a number of gentlemen present. The samples were all large, of a beautiful yellow, and almost transparent in their purity. The trees are excellent bearers, and the fruit keeps coming and going the year round.

ARIZONA.

EGYPTIAN WHEAT.—*Florence Enterprise*: There is on exhibition in our sanctuary a specimen gathered at random from the field of Mr. John Guiliani, a short distance above Florence, on the Alamo Amarilla canal. The sample, grown from a single seed, has 52 distinct stalks, each bearing full heads of grain, while more than one-half the number of heads are double or triple, the auxiliary heads having sprouted from the base of the main head. A few years ago Mr. Guiliani found a stray plant of this grain growing in his fields, and he carefully watched its growth and protected it from harm. The yield is simply enormous, and the grain is heavy and produces good flour. It grows to a height of five feet, with strong straw that is not easily broken down by wind or rain.

LUXURIANT ALFALFA.—Mr. Fuller has presented the *Enterprise* with a bunch of alfalfa, cut on his ranch above Florence. It measures from seven to nine feet in length, and is but a sample of the growth in his entire field. Much difficulty is experienced in cutting such heavy grass, and the mower makes slow progress notwithstanding the care taken to remove the cut grass from its path.

THE CLYMAN PLUM.—Mr. Leonard Coates of Napa sends us samples of his new seedling plum, the "Clyman." The variety ripens in Napa with the Cherry plum. It has the advantage of much greater size, though Mr. Coates writes that the specimens are below the average, as the tree is overloaded. The specimens show a roundish plum of about 4½ by 4½ inches in circumference; light red, shading to dark, with occasional yellowish blotches, the whole covered with a delicate violet bloom; flesh, light greenish-yellow; flavor, rather pleasant acid—not rich. For so early a fruit its size and general appearance bid fair to make it desirable. As a new fruit we may have an engraving of it later.

"Two Sinners."

There was a man, it was said one time,
Who went astray in his youthful prime.
Can the brain keep cool and the heart keep quiet
When the blood is a river that's running riot?
And the boys will be boys, the old folks say,
And a man's the better who's had his day.

The sinner reformed, and the preacher told
Of the prodigal son who came back to the fold,
And the Christian people threw open the door
With a warmer welcome than ever before.
Wealth and honor were his to command
And a spotless woman gave him her hand,
And the world strewed their pathway with flowers
A-bloom.
Crying, "God bless lady and God bless groom!"

There was a maiden went astray,
In the golden dawn of life's young day.
She had more passion and heart than need,
And she followed blindly where fond love led,
And love unchecked is a dangerous guide,
To wander at will by a fair girl's side.

The woman repented and turned from her sin,
But no door opened to let her in;
The preacher prayed that she might be forgiven,
But told her to look for mercy in heaven.
For this is the law of the
earth, we know,
That the woman is scorned,
while the man may go.
A brave man wedded her,
after all,
But the world said, frown-
ing, "We shall not call."
—Ella Wheeler Wilcox.

The Kindergartens.

(Written for the RURAL PRESS
by L. J. DAKIN.)

All the children in California will like to hear about the kindergartens of San Francisco. Every little boy and girl who lives on a big ranch or in a little mountain town, among the foothills or in the broad valleys, will like to hear about children who have teachers to learn them how to play.

Just think of it! Do you wonder that the little city children love to go to such a school as that? Quite a long time ago I went to call on a lady and found her little daughter on the doorsteps crying because she was locked out. "I've been to the tunderarten, and our dirl has locked me out 'cause mamma's gone. Wis't I could stay to the tunderarten all the time!" sobbed the poor little thing as she hid her face in her long white bonnet, refusing to be comforted.

I began to wonder what the kindergartens were like; and now, boys and girls, I have been to see them and will tell you what I saw. I went into a poor part of the city, where the streets were narrow and dirty. Such a sad place as that would be to play in! but it was all the little children had till the good people who started the kindergarten provided two large, sunny rooms, way up above the dirty street; and here were 50 happy little boys and girls learning such nice ways to play games and to play work. In one room there were broad circles painted on the floor, and the children came marching down the center and then upon the big outside circle. The piano was played and teachers and children sang:

Let your feet go tramp, tramp, tramp,
Let your hands go clap, clap, clap,
Let your finger beckon her;
My dear Lulu, dance with me—
Tra la la, tra la la.

You would have laughed to see them clap their hands or roll them one over the other as they marched, each lifting the right foot high and bringing it down with a smart tap of the little heels. They were like a long row of Kate Greenaway figures, but all alive and smiling. When they sang "My dear Lulu, dance with me," one little boy who had stood in the center walked up to one who was in the circle and they made their little bobbing bows to each other and then danced away together. After this was repeated a few times, the teacher asked what game they would have next.

"The Blacksmith," called one sturdy fellow who had two grand muscular little arms of his own.

"The Bootblack," called another.

"The Basket," said the girls.

"The Bastit, the Bastit," echoed the smaller ones. So they had the Basket, the boys standing

two by two, while the little girls joined hands and marched in and out, in and out, as though they were weaving around the sticks of a basket. One of the boys was a naughty little stick and would not stand where he ought, so he had to be taken out till he promised to be a good straight stick.

"Now what flowers shall we put in our basket?" asked the teacher.

"Roses," "Buttercups," "Heliotrope," they said, and twenty voices echoed "Heliotrope," because they thought it a hard word and were rather proud to think they knew it.

"Let us have wild flowers this morning," said the teacher, as she set a vase of buttercups and California poppies in the center of this lively little basket and asked them the real name of the poppy.

"Eschscholtzia!" cried some of them, eager to show how well they remembered what had been told them. I wonder how many country children, who have the flower growing in their fields, could have told the name.

After this they had the song and play of the "Little Worm" which suddenly turns to a butterfly.

A little worm is on the ground,
It creeps, and creeps, and creeps around,
'Tis spinning now a little nest
That it may find a place to rest.
Dear little worm, we'll say good-bye
Till you come out a butterfly.

When the song ends the children who have been hiding their heads for the worm, spring up and wave their arms like wings, and seem to feel for a minute that they are really beautiful butterflies.

We did not stop here to see the little ones commence their work, but went on to the Jackson-

We also visited the kindergarten known as Stanford No. 3, which is away out near Twenty-third and Mission. Here they have quite a large yard for out-of-doors play and a small flower-garden very well cared for. At this school we saw another kind of work, which was, molding in clay any figure they were capable of forming. Of course, such little tots could not do much; they seemed to spend their energy making balls like marbles, though a few under the teacher's guidance tried to make bowls, chairs and dog-houses. The youngest child in school, a wee sweet girl, only two and a half years old, touched clay for the first time that day, and as she was a neat little thing, she seemed quite shocked to find it daubed her hands. It was laughable to see the haste with which she got out her handkerchief to wipe her fingers. She had to be encouraged before she would touch it again; then nature showed itself she could soon make balls as fast as any of them.

I must tell you about some of the games they played here. The children sat in a circle on the floor and chose one of their number for the baker. So away he trots, puts on his white cap and apron, rolls up his sleeves, sets a little table in the center of the ring, and lays on it a molding-board and rolling-pin. The teacher then played the piano and they all sang:

Here comes the merry baker,
He makes us good sweet bread;
He wears a neat white apron,
A white cap on his head.
He rolls, he rolls, he rolls, he rolls
Good pies and cake and bread.

Here comes the merry baker,
Good flour does he use;

if they were tight, they pounded on the bottom to see if it was firm, they shook and thumped the staves till one of them decided it was not made well enough to keep meat in, so he would not take it. Then the boy who wanted it for nails offered 50 cents for it. But the cooper said that was not enough; he could not support a family if he sold barrels for 50 cents. So finally it was sold for \$1.00. They pretended to pass the money from one to the other, and the barrel was carried away.

Now is it not a grand thing to have all these children trained to methodical habits, and taught to make persistent effort every day in some direction? Why, probably some of them never had clean clothes or clean faces till they came to the kindergarten; but here are little rooms with plenty of water, soap and towels, so if any come without a wash they will be sure to get it here. They are not allowed to use bad language as they would do if left to run in the streets, but learn to have self-respect, and to feel that all honest work is honorable. Don't you think they will be happy in making real barrels some time, and being real blacksmiths? Or making real bread, and sweeping real rooms?

Blessings on the kindergartens that save dear little children from learning wicked ways, and teach them truth, charity and loving-kindness instead. And blessings on the kind, noble women who started them, and all who now work for them.

Let other cities do as well as San Francisco has done in this respect. And now if any boys and girls who live in country places, and have broad fields, or great orchards, or beautiful gardens to play in, would like to help some poor street child to go to these schools, let them tell us what they think about it in their letters to the RURAL PRESS.

THE WAY SHE CURED

HIM.—"What brings you here, Mary?" said Truesdell to his wife, as she entered the liquor-shop. "It is very lonesome at home, and your business seldom allows you to be there," replied the meek but resolute wife. "To me there is no company like yours, and as you cannot come to me, I must come to you; I have a right to share your pleasures as well as your sorrows." "But to come to such a place as this!" expostulated Tom. "No place can be improper where my husband is," said poor Mary. "Whom God hath joined together, let not man put asunder." She took up the glass of spirits which the shopkeeper had just poured out for her husband. "Surely you are not going to drink that?" said Tom in huge astonishment. "Why not? You say that you drink it to forget sorrow, and surely I have sorrows to forget." "Woman, woman, you are not going to

give that stuff to the children!" cried Tom, as she was passing the glass of liquor to them. "Why not? Can the children have a better example than their father's? Is not what is good for him good for them also? It will put them to sleep, and they will forget that they are cold and hungry. Drink, my children; this is fire and bed and food and clothing. Drink; you see how much good it does your father." With seeming reluctance Mary suffered her husband to lead her home; and that night he prayed fervently that God would help him to keep a newly-formed but firm resolution. His reformation was thorough, and Mrs. Truesdell is now one of the happiest of women, and remembers with a melancholy pleasure her first and last visit to the dramshop.—Selected.

USED TO EARTHQUAKES.—The pressman in the Martinez Item office is a man of muscle, and when the old Washington is going the building quivers like an aspen. A gentleman evidently not accustomed to printing establishments was seated in a neighboring office, the other day, just about the time it was usual to work off the outside. His reveries were suddenly disturbed by a low rumble, a quiver of the house and a tremendous thump. He sprang from his chair and ejaculated: "Jewhilkens!" Seeing the attorney, whom he was consulting, looking all serene, he got over his nervousness and settled down again, only to be again aroused by a r-r-r-r BUMP! This was more than he could endure, and in terrified tones he asked: "Have you so many earthquakes around here that you get used to them?"

ANCIENT EGYPTIAN CLOTHS.—The selvages of the ancient Egyptian cloths generally were formed with the greatest care, and were well calculated by their strength to protect the cloth from accident. Fillets of strong cloth or tape also secured the ends of the pieces from injury, showing a knowledge of all the resources of modern manufacturing.

SCENE IN A SAN FRANCISCO KINDERGARTEN—"WEAVING."

street Kindergarten. As we came into their room we saw a pretty scene like a picture. First, there was a row of boys and girls sitting in a large circle on the floor. In the center of this circle were four little girls with white work-aprons on, their sleeves rolled up, and cunning white caps on their heads. They were learning to wash clothes. They had boxes for wash-benches, and three of the girls had each a nice little tub just big enough to wash doll-clothes in; but the fourth girl had a cute little stove with a tiny wash-boiler on top of it.

"What do you do to your clothes first?" asked the teacher. "Do you rub them on the washboard?"

"Yes," said the little one who had the clothes and a rubbing board in her tub. And then she began to rub them and pretend to wring them out, for there was really no water in the tub; they were just learning how they must do when they did have water. When they were all rubbed clean they took them over to the stove and put them into the boiler.

"What do you do after the clothes are boiled?" they were asked.

"We rinse them," said the little girl who had the rinsing tub.

"And then we blue them," added the little girl who had the bluing tub.

"That is right, and now they have boiled enough, you may do your part."

So they made believe to rinse and blue them, and then the teacher gave each a little bag of tiny clothes-pins and stretched a line for them, and in a few minutes they had their dolls' washing all hung up. This finished their games, and they all marched to their seats to begin their work. One class wove red and yellow paper into pretty and even difficult patterns. Another pricked leaves and other figures on cardboard, coloring them with tinted pencils. Others formed squares, angles and triangles of bits of painted wood about the size of matches. Still another class learned to sew through holes pricked in cardboard.

He rolls it into pies and cakes,
Whichever you may choose.
He rolls, he rolls, he rolls, he rolls
Whichever you may choose.

Every one made the motion of rolling with their hands just as the baker did with his rolling-pin, and when the song was ended the teacher asked:

"What do you choose of all things the baker makes?"

"Blackberry pie!" said one, and then they all said "blackberry pie," like so many little mocking-birds. So the baker pretended to take a basket and deliver to each child a blackberry pie.

Four little maids then had a game of sweeping the room with four little brooms while a fifth little maid took up the dust with dustpan and brush. After this came a little cooper with nails in the pocket of his apron and a hammer with which he pounded the hoops on his barrel. They all seemed to like this and sang with a will:

Oh, I am a cooper and barrels I make,
Some wood and some bands of strong iron I take;
So merry and happy I always am found,
As with my big hammer I pace all around.
Rap a tap, rap a tap, rap a tap a toe.

Oh, I am a cooper and earn my own bread,
And by my hard labor my children are fed;
So merry and happy I always am found,
As with my big hammer I pace all around.
Rap a tap, rap a tap, rap a tap a toe.

When the barrel was finished the cooper said he wished to sell it because he must have money to support his family.

"How many children have you?" asked the teacher.

"Five," said the little cooper.

"Do you want to buy a barrel?" she asked of the class. "It is very useful; can you tell me what you would put in it?"

"Meat," said one; "Apples," said another; and "Nails," said a third.

Four boys now came to the cooper and examined his barrel. They pulled the hoops to see

What the Geranium Heard.

[Written for the RURAL PRESS by FANNIE H. AVERY.]

The flowers were holding a conclave,
One radiant summer day,
On a very weighty subject,
All having much to say.

'Twas on the matter of color—
Why were violets blue?
And why should the rose so stately
Be of a crimson hue?

Why was the lily snowy white,
The marguerites so fair?
How came the heliotrope's tinting
So delicate and rare?

Long they debated the question,
Instancing every flower
And pondering on its shading—
Whence came the lovely dower?

At length a tall geranium
Said, as it swayed and bowed,
"Perhaps I can tell you something
To dissipate this cloud.

"Last night our master was walking
Among us, after tea,
With a friend he called 'Professor'—
Grave, dignified was he.

"They paused for awhile beside me,
Conversing about light—
The beautiful, dear sunlight
We love, so warm and bright.

"When suddenly the Professor
Nearly took my breath away,
By saying the flowers' colors
Are due to sunbeam's ray;

"That our chemical construction
Makes each of us absorb
Particular parts of the spectrum
Of daylight's glowing orb;

"While that we cannot gather
Is thrown back to man's eye,
And makes us appear possessed of
One or another dye."

The geranium paused, unable
To add a further word,
Nor could a blossom comment on
The story it had heard.

A hush fell o'er the assembly,
Each flower was very still,
While from a tree on the roadside
Rang out a wildbird's trill.

Anti-Saloon Resolutions.

The Anti-Saloon Republican National Conference, held in Chicago, September 16, 1886, declared as follows:

1. That the liquor traffic as it exists to-day in the United States is the enemy of society, a fruitful source of corruption in politics, the ally of anarchy, a school of crime, and, with its avowed purpose of seeking to corruptly control elections and legislation, is a menace to the public welfare and deserves the condemnation of all good men.

2. That we declare war against the saloon and hold it to be the supreme duty of the Government to adopt such measures as shall restrict it and control its influence, and at the earliest possible moment extinguish it altogether.

3. That we believe the National Government should absolutely prohibit the manufacture and sale of intoxicating liquors in the District of Columbia and in all the Territories of the United States.

4. That we believe the best practical method of dealing with the liquor traffic in the several States is to let the people decide whether it shall be prohibited by the submission of constitutional amendments, and until such amendments are adopted by the passage of local option laws.

5. That inasmuch as the saloon business creates a special burden of taxation upon the people to support courts, jails and almshouses, therefore a large annual tax should be levied upon the saloons so long as they continue to exist. And that they should be made responsible for all public and private injury resulting from the traffic.

6. That the Republican party, wherever and whenever in power, should faithfully enforce whatever ordinances, statutes or constitutional amendments may be enacted for the restriction or suppression of the liquor traffic.

7. That we approve of the action of Congress and of those States that have done so, in providing for teaching the physiological effects of intoxicants in our public schools, and that we earnestly recommend to every State Legislature the enactment of such laws as shall provide for the thorough teaching of such effects to our children.

8. That we demand that the Republican party shall take a firm and decided stand as the friend of the home and the enemy of the saloon, in favor of this policy and these measures. We pledge ourselves to do our utmost to cause the temperance men and friends of humanity—of whatever party or name—to join with us in securing these objects and in support of the Republican party, so far as it shall adopt them.

A leaf of the giant water-lily (*Victoria regia*) has been known to measure 24 feet 9½ inches in circumference, its weight being nearly 14 pounds. One of the flowers was four feet two inches in circumference, with petals nine inches in length, and weighed 3½ pounds.

"Silotwor" is a new explosive ten times the strength of gunpowder, exploding without smoke or noise. A Russian invented it.

YOUNG FOLKS' COLUMN.

How S'manthu Managed.

"Yes, Patty, you're going to have them hair-ribbons, if there isn't anything else got. You deserve 'em, I'm sure." "But I'm having my new dress, mother, and it seems as if I hadn't ought to." "Never mind that. I ain't forgot how you worked side by side with Jim at the husking. Here's 30 cents I've been saving up just for them ribbons." "The last you've got?" asked Patty. "No; there's 15 cents more in case of a letter to be written, or any extra call." "You're real good, mother," said Patty, taking the money gratefully. "I'll get dark red, I think. It'll go lovely with the green stripes on my dress." "Yes," "I'll go and buy 'em this afternoon, then I can get back before S'manthu comes to loop up my dress. And then they'll both be ready for the magic lantern." "Yes."

And Patty went up the ladder to her little half-story room, to put away the three precious dimes, feeling richer than ever before in her 12 years of life. Upon a pine shelf under the rafters lay her nearly finished new dress, a cotton and wool delaine, brown, with the admired green stripe; and she turned up a corner to give it a satisfied pat before hurrying back to her work. Nothing quite so grand as this dress had ever come to Patty before. It had been bought new on purpose for her, not cut down from her mother's, and S'manthu Van Patten had been hired for half a day to cut and fit it, and was coming in again, now that Patty had made it, to put some mysterious finishing touches to it, for it was cut after a new and stylish pattern, a "Polly Nay," S'manthu called it. Patty had read of a thing in fashions called Dolly Varden, and concluded that "Polly Nay" must be some kin to her.

"I'm to speak a piece at the magic lantern!" said Jim, rushing home from school at dinner-time. "Dear me—you Jim?" Patty opened her eyes wide at hearing of such distinction. "Yes; and my neck-tie's all wore out." "Perhaps we can rub it up with turpentine," said his mother, with a troubled look. "I don't believe you can. Last time it was rubbed up it rubbed through; and it's all bare and fuzzy just under the chin."

Jim brought the article. It had done duty for a long time, and there was no denying its shabbiness. "P'raps I'd best not speak a piece, then," said Jim, in a discouraged tone. "Oh, you mustn't give it up," said Patty, very positively. "They want to make it a great success, you know, Jim." Patty's loyal little heart entertained no doubt of Jim's piece rendering the magic lantern exhibition a success. "No, it's for the missionaries, and we must do all we can," said mother. "If you could hold your chin down a little," she suggested, trying to pull the neck-bow into better shape. "How could I, and speak a piece?" asked Jim. "No, he couldn't," said Patty, shaking her head.

She knew Jim could not be relied upon for anything of the kind. She remembered well the time she had set a patch in the back of his coat which would show in spite of her best care. How she had cautioned him when he was going to spelling-school, to move a little sideways when he was chosen, so that the patch would not be seen by the audience. And now that boy had forgotten every word she had said, and had, on every opportunity, turned his back, if possible, squarer than ever before.

"I can't buy you one, my boy," said mother. "There's only enough money for Patty's hair ribbons, and she needs 'em just as bad."

In the afternoon Patty set out on her two-mile walk over the prairie to the one store in the small village. The roadways in the thinly settled country were not well tracked, and as the mud was deep, she found the walk a rough one. But her mind was too full of weightier concerns to dwell on the difficulties of the way. It was hard on Jim not to be able to have a new tie. If she could only get him one! but of course she couldn't. If it was a longer time ahead, she might contrive to get hold of a bit of money, but it was just now, so he must wear the old one. She pulled around a braid of her hair. How shabby and faded the old ribbons looked! They had been washed time and again, and were now fraying into strips. She had been looking forward for weeks to this exhibition, and her new dress was done, and she must have those ribbons. She had told all the girls about them.

Slowly she went into the store. There was no use in asking to look at the roll of ribbon. She had examined it more than once, and knew exactly its quality and width and its price—15 cents a yard. Two yards would make two generous ties, good loops and ends hanging well down. "Neck bows? Yes, Patty; some high-styled ones, just in. Look a-there now."

In a small store, containing everything from a barrel of salt to a gilt breastpin, the assortment of neckwear could not be large, but the bright satin bows were all Patty could have desired. At the last moment she cast a lingering look at the roll of ribbon; but no! Jim was to speak a piece, while she had nothing to do in the exhibition except singing with the other scholars. She trudged home, her unselfish little heart warm with the thought of Jim's surprise, but wondering within herself if nothing could be done to render her ribbons less shabby in the light of the tallow candles

with brass reflectors, which made in the school-house the finest illumination she had ever known.

"Yes, here I be a-waitin' for you," was S'manthu Van Patten's cheery greeting, as she stepped into the house. "S'pose you've got your dress done splendid, hey? Such a smart little thing as you be."

The dress was put on, and looped and draped with a painstaking which brought a look of gravity over S'manthu's broad, good-humored face, rarely seen there. "There, now," she exclaimed at length, relaxing, "I call that the stylishest 'Polly Nay' I've cut this season! Got your new ribbons, I s'pose?"

"No," said Patty, stopping short in her efforts to see herself in a looking-glass no larger than a dinner-plate, "I got a necktie for Jim instead."

Mother expostulated, but took down and displayed the old tie. "It is most fearful shabby, sure enough," said S'manthu, with a critical look. "But, bless me! the wonders I've done a-makin' over old ties! Let me see." In a twinkling her nimble scissors tore apart the old loops. "My!" exclaimed Patty, as their backs were turned. They were almost as bright as if they had been new.

S'manthu snipped, and folded, and stitched, her tongue moving as rapidly as her fingers. The loops had to be a trifle shorter, and it needed very skillful contriving to bring out the brightest streaks in the cross-piece; but in ten minutes she laid before Patty's eyes a tie which set her dancing about the room in delight. "Jim wouldn't know it from new," S'manthu declared, "if you don't let him see the new one. Now, Patty, you go back and change it for your ribbons the first thing to-morrow."

Patty put on her new ribbons before supper on the night of the magic lantern show. Jim looked admiringly at them, but could not forbear a rueful thought of his old tie. "Let me fix your neck, Jim," said Patty. She had ironed his collar with special care. "Now look!" she said, leading him to the glass. "Hello! A new one? Jolly! How did you get it, mother? And why did you get it like the old one, anyway?" In great glee, Patty told the story, ending with a hug, which Jim energetically returned. And in a glow of happiness they all set out for the exhibition, listening to a few gentle suggestions from mother. "Now you speak your very best, Jimmy, my boy. And, Patty, you be sure and sing up loud. We that's got so much to be thankful for, 'd ought to do all we can for them that has so little."

GOOD HEALTH.

Zymotic Diseases.

The S. F. Bulletin last week contained an interesting article on the causes of what are termed zymotic diseases, from which we give the following extracts:

In 1876 there was a curious outbreak of typhoid fever in the suburbs of Syracuse, N. Y. The doctor who had been called on undertook to solve the mystery. He first applied himself to the sewers as the propagating medium, but he found that houses which were not connected with the sewers had the disease just the same as those which were. At last he discovered the circumstance that all the houses that drew water from a certain well had the fever. There was a second well in the district. The houses which drew their water there were free from the complaint. Further investigation established the fact that the well which was now clearly the cause of the outbreak had been infected by a neighboring cesspool.

Dr. Klein, in a recent lecture before the Royal Institution of London, stated that the "epidemics known as milk scarlatina, milk diphtheria, and I may also add milk typhoid, have this in common—that almost simultaneously, or at any rate within a short time, in a number of houses having no direct communication by person or otherwise with one another, there occur, sometimes singly, sometimes in batches, as it were, cases of illness—scarlet fever, diphtheria, or typhoid fever, as the case may be; and it was this peculiar character which pointed to a condition which must have been common to all these households. On closer examination it was indeed found that all these households had this, and only this, in common—that they were all supplied with milk coming from the same source—that is to say, from the same dairyman. Other houses, supplied with milk from a different source, escaped; and further, it was shown that as soon as the consumption of the suspected milk ceased, the epidemic, as such, came to an end, except, of course, the cases due to secondary infection from person to person."

This statement can be assigned only to the position of circumstantial evidence. But Dr. Klein, perhaps, advanced to the citadel of the secret when he stated that it had been shown at a certain farm in England, Hendon by name, that "there existed certain cows affected with a communicable disease, which on many points of its pathology bears a great resemblance to human scarlatina; further, that the milk of these cows gave scarlet fever to human beings; and lastly, that a particular microbe was obtained from these cows which in calves produced a similar disease to the disease of these cows." The lecturer added: "It has been shown that in the blood and tissues of persons affected with scarlet fever there occurs the same micro-

coccus as was present in the cow, both being identical in microscopical and in cultural character."

But Dr. Klein is not simply destructive. Milk is a general article of food—in some cases of necessary food. If there are such dangers attending its use, there would be a disposition to abandon it altogether. There is, he says, fortunately, a simple remedy in case of suspicion—that is to say, scalding. Dr. Klein says: "I have found that heating milk to 85° C. or 185° Fahrenheit, that is considerably under the boiling point, is perfectly sufficient to completely destroy the vitality of the microbe of scarlet fever." The case cannot be said to be absolutely made out. But it is not very far from it. It stands upon infinitely higher grounds than the interested speculations that are so common. Bad sanitation is something to be avoided. The old belief ascribed stagnant pools and foul places to malignant spirits. We translate them in modern language into various diseases. There ought to be cleanliness inside and outside in all communities.

DOMESTIC ECONOMY.

POTATO BALLS WITH CREAM SAUCE.—Pare any number of potatoes, and cut balls from them with a vegetable scoop. From a dozen potatoes you should get about 60 balls. Cover them with boiling water, and cook 12 minutes without salt. Pour off the water; add to the potatoes one pint of boiling milk, into which stir two tablespoonfuls of butter, mixed with one level teaspoonful of salt, one-third of a teaspoonful of pepper, and, if liked, a teaspoonful of chopped parsley. Use white pepper altogether. This sauce is for a quart of balls.

BLACK SPICE CAKE.—The yolks of four eggs; mix 2½ teaspoonfuls of baking powder in 2½ cups of flour, one cup of brown sugar, one-half cup of syrup, one-half cup of milk, one-half cup of butter—the butter must be melted after being measured and stirred with the sugar—2½ teaspoonfuls of powdered cloves, one teaspoonful of cinnamon, the same of allspice; the spices must be put in the flour, the syrup added after the sugar and butter are stirred together, then the eggs and milk; lastly, the flour.

STRAWBERRY FRITTERS.—Beat two eggs well (the whites and yolks separately), then add to them a teaspoonful of cream and a pinch of salt, stirring in enough flour to make a thick batter. Now beat the mixture well, and when thoroughly smooth throw in a pint of strawberries. Have plenty of boiling hot fat in the frying pan and fry the same as ordinary fritters. When done to a golden brown color take them out, drain them and serve on a napkin, with sifted sugar strewn over the tops.

CITRON CAKE.—Three cups of sugar, one of butter, one of sweet milk, four cups of flour, one-half teaspoonful of soda and one of cream of tartar. Cut up one-half pound of citron fine and thin and the whites of ten eggs. Cream the butter and sugar; sift the flour and add gradually, then the citron. Beat the eggs until stiff and add last; sift the cream of tartar in the flour and dissolve the soda in a little tepid water. Beat all thoroughly before stirring in the eggs.

KIDNEYS SAUTE.—Cut three kidneys each into five pieces; put an ounce of butter into the saute pan (frying pan); when very hot put in the kidneys, stir round for a few minutes with a spoon till they are set. Add a teaspoonful of flour, a quarter of one of salt and the third part of that of pepper. Mix well; add half a gill of broth and a few mushrooms. Do not let them boil. A few minutes is enough to do them.

BAKED PIE PLANT.—Cut two pounds of pie-plant into a pudding dish, sprinkle over it half a cup of sugar and two tablespoonfuls of flour, or, what is better, half a cup of rolled bread-crumbs. Add water until the plant is two-thirds covered. Bake in a quick, warm oven 30 or 40 minutes. This method of preparing rhubarb or pie-plant removes the medicinal taste and makes an acceptable spring dish.

CHEESE CAKE.—Take two cups of cottage cheese, mash well, add three eggs, not beaten, one at a time, sugar to taste, one tablespoonful of flour, a little nutmeg, a little salt and milk enough to make a little thicker than custard. Bake with an under crust. When ready for the oven, sprinkle cinnamon on top. Make it about an inch thick.

BREAD GRIDDLE CAKES.—Soak a small bowl of bread over night in milk. In the morning mix half a cupful of flour, into which is put 1½ teaspoonfuls of baking powder, with one quart of milk, three well-beaten eggs and a little salt. Beat up the bread with this batter until it is very light and fry a delicate brown. The batter should be thick.

GINGER SNAPS.—Mix one pound of flour and three quarters of a pound of white sugar. Rub into it half a pound of butter, two eggs well beaten and an ounce of ginger ground fine. Beat all well together, roll out the dough to the third of an inch thick, cut out the cakes and bake them. These are far superior to ordinary ginger snaps.

WHITE CAKE.—One cup of milk, two cups of sugar, ½ cup of butter, two eggs, three cups of flour, 1½ teaspoonfuls of baking powder and a little nutmeg.

The Week.

The Fourth has come and gone, but the city is still somewhat dreary over the thousands who are ensconced beside the sea, or stream, or spring, or mountain lake, reveling in rural rest and pleasure-seeking. The community recovers slowly from a great holiday, especially when the day comes as this year, in such position that it drags two others with it into the charms of idleness. Practically, the city rested from Friday night until Tuesday morning and has not yet regained its appetite for trade and labor.

Rural notes are rather pleasant. The grain crops are turning out rather better than expected, in some districts at least. Fruit is beginning to arrive in vast quantities, but is in the main disappearing from view quite satisfactorily. The canneries and drying establishments are running at their full capacity, and nearly all hands large enough to grasp a knife are "splitting 'cots" with the utmost rapidity.

Preparations for the fairs continue with vigor. The rivalry between the two great institutions, the State Agricultural Society and the Mechanics' Institute, is leading to extra efforts on the part of each to draw out counties and

individuals to do their duty. If effort will do anything we shall have two grand displays this year. Such opportunities for setting forth the resources of the State should not be passed by.

New York Auction Sales of California Fruit.

It is with no small satisfaction that we note the success of the first sales of California fruit at auction in New York City. We have a special and general satisfaction. First, because through the wise and timely effort of Capt. H. Weinstock of Sacramento, who went East as the Honorary Commissioner of the RURAL PRESS, to study the marketing of California fruits in the interest of the growers, we were enabled first to proclaim the auction method as the key to the situation. Our second and greater satisfaction is that the auction method, so far as it has been tried, bids fair to vastly widen the Eastern outlet for our green fruits and thus benefit either directly or indirectly every man who has an orchard or vineyard in the State.

As was announced last week, the first auction sale was held in New York on Tuesday, June 28th. The fruit was shipped by the California Fruit Union, and the sale was under the auspices of Sgobel & Day, the New York agents, R. B. Blowers, the Eastern manager of the Union, also being present. It was a carload of assorted fruit which left Sacramento by ordinary fruit-car attached to the regular overland passenger train. The fruit arrived in good order. The gross returns of the sale were \$1500, of which \$625 was paid for freight and a small amount for commission. The average net amount which the fruit brought per pound was 4½ cents—i. e., the growers receive 4½ cents per pound for this fruit placed on the car at Sacramento. The peaches and apricots brought the best price, selling for from \$2 to \$2.50 per crate of 20 pounds. Pears and plums did not bring so much. The cash returns for this sale are now on the way to the producers, whereas, under the old commission system, they would have had to wait a month or more. The members of the Union are naturally jubilant and declare that the auction plan of marketing is a great success.

Returns of the second sale, which was held in New York on Thursday, June 30th, were also satisfactory. The new order of things is naturally attracting much attention. A telegraphed paragraph from the New York Herald of July 1st is as follows:

How is it that fruit is so much finer and so much cheaper this summer than last year? is the question which has puzzled New York people for some days. Peaches, pears, plums and magnificent apricots are found now, even on every stand in the streets. * * * The California Fruit Union has entered into an arrangement with Sgobel & Day of New York which is likely to revolutionize the fruit trade. It will no longer take 15 days to transport the fruit, which will now come direct from California by fast express trains of 5 or 10 cars, running on trucks such as are used under passenger cars. The time from California over the Central Pacific, Union Pacific and Erie railroads will be less than seven days. The question of distribution has also been satisfactorily solved, and all fruit will hereafter be sold at auction—just as is the fruit from the Mediterranean and from Florida—through Brown & Secomb, at Broad and Beaver streets. Two such sales have already taken place, one on Tuesday last and the other yesterday. Upon the first occasion the fruit was disposed of at the following prices: Boxes pears, \$3; half-boxes peaches, \$2.50; half-boxes plums, \$2; half-crates plums, \$1.50; half-crates apricots, \$2.10. At yesterday's sales plums brought \$1.50 to \$1.95 and apricots \$2.05 to \$2.30.

The results have proved so satisfactory that the New York agents ask that fruit be sent forward as fast as possible, and cars are being dispatched as frequently as the fruit is received by the Union. The Bee says that up to July 1st five cars had been sent to the New York auction. Of these, four were from Vacaville. W. R. Strong & Co. dispatched one carload of Sacramento-grown fruit—plums, pears and peaches.

It is, of course, too soon to pronounce final judgment upon the auction plan of selling fruit, but it is eminently satisfactory at least to see it opening so well and to know that fruit is going off so satisfactorily in a market which has been cried down and hitherto had fruit doled out to it as to a colicky child. The outlook for the new order of things is certainly promising.

EMPTY. — An empty envelope postmarked Azusa has been received. Where is the rest of it?

A Political Scare-Crow.

Our mind-cure people, whatever may be thought of their philosophy of healing, teach us some very excellent truths. They tell us that fear acts both directly and indirectly upon the body, and often is the cause of disease; that fear of disease begets disease, and that a fearless person may pass unharmed through the cholera, smallpox, yellow fever, and other malignant contagions; that in short, the secret of health is to cultivate the habit of keeping clean and healthy pictures in the mind.

We thought of this yesterday morning as we came across on the Oakland boat and heard a very intelligent gentleman, speaking of the Fourth of July and the sanguine and roseate hopes indulged in by the average orator and newspaper-writer of the future greatness of the Union, say that he did not share in this feeling, as he believed that it was destined ultimately to fall to pieces from its clumsy weight and unwieldy magnitude. There must be something morbid in the patriotism that borrows trouble and conjures up such ugly specters as this. As with our own body, so it is best to think only of what is brightest, best, and most healthy in that political organism of which we all are a part. Still there is a good deal of this sort of cant and persiflage to be found in foreign journals and reviews which might serve to amuse us were it not for the fact that some of our own political writers look with pessimistic and painful apprehension upon a government founded upon the popular will expanded over so large an extent of territory. It is generally admitted that a diversity of race is produced by climate—that white, black, red, olive and copper-colored people are the children of the sun and soil. In our diversity of tastes, habits, ideas and costumes among our people that will be a good soil for planting the seeds of alienation and strife? That in the very nature of things the interests of Minnesota and Georgia, the Atlantic and Pacific States, cannot always continue identical, and that they may some day differentiate into well-defined antagonisms that may endanger the peace, if not the stability, of the Union? The aforesaid gentleman may have been one of those queer compounds that is always on the contrary side, or it may be that he is haunted by some such vague, half-shapen fear as just described.

But a moment's thought will show it to be an ugly phantom, and nothing more. Dr. Draper somewhere calls attention to the fact that the strength and durability of a nation is in the ratio of its facility of communication. History furnishes an illustrious example. The empire of ancient Rome held together over five centuries, and only passed away at last as an iceberg melts in the heat of a better civilization. It was the policy of that people as soon as they conquered a country, though as far away as Gaul or Britain, to open a good highway for travel and easy and quick transportation of armies. Many of the subjugated nations often lifted up their heads, and seeing how small and remote the empire that held them in subjection, thought to break the yoke, but before the purpose was fully organized the Roman legions were upon them.

And yet how slow were the means of communication in that age compared to what we possess. Our whole land is woven together by muscles of iron and nerves of steel. We can whisper our thoughts to a friend in New York in a few moments, and in less than a week traverse the width of the continent. It is obvious that the greater the speed of communication the more compact and strong the National Government. The 38 States of the Union today are more closely compacted than the 13 original States that hung together through the struggles of the Revolution. Indeed, had it not been for the facility with which vast masses of men could be thrown from the East to the West, and from the West back to the East again, the chances are the great rebellion would have been successful. And then the iron path of the locomotive has bound the States of the Union into a network of commercial ties and reciprocal interests, that more than anything else solidifies our nationality. It is about time we had got over scaring at that hideous old spook that so long haunted our politics and set like a nightmare upon the Government, and have faith not only in the destiny of our political idea, but in the durability of our Republic.

University Notes.

The year at the State University closed last week and upward of 40 graduates were sent out with the approval and good wishes of the Regents and Faculty. The commencement exercises were in every way satisfactory. President Holden's address to the graduates was one of the most admirable we ever listened to. A very pleasing incident of the day was the welcome extended to ex-President Gilman (now president of the Johns Hopkins university), who arrived from the East opportunely while the exercises were in progress.

A graduate of the College of Agriculture, Mr. F. C. Turner, submitted a thesis on "germination tests of commercial seeds," which was marked by many points of practical value and to which we may allude at greater length hereafter. He had made careful duplicate tests of a number of kinds of field and garden seeds procured at a San Francisco seed-store. The tabulated results were compared with seed tests reported by the Eastern Agricultural Experiment Stations and made an excellent showing for the California seeds.

Prof. Hilgard has retired for rest and for more direct contact with nature in her visible forms, to his farm in the southern part of Alameda county. He has had a hard year's work, and has applied himself to it most assiduously, as is his wont, and a season of recuperation is necessary. During the vacation the public laboratory work ceases, and all matters which can as well be postponed should be held back until the opening of the session in September. Arrangements have been made to attend as far as possible to matters of pressing importance which may be submitted, and correspondence relating to such matters will be attended to by Prof. Hilgard's assistant, who remains in Berkeley.

Mr. F. W. Morse departed on Tuesday for Los Angeles county to continue his experiments with the gas treatment for scale insects, which were recently described in the RURAL and which promise such satisfactory results.

Visitors at commencement expressed much satisfaction at the improvements in the contour of the main grounds in front of the buildings, which is now proceeding under the direction of Dr. Bonte, the secretary. The old, unsightly artificial embankment has been swept away and the whole field has been given a natural slope quite in harmony with the best principles of landscape art, and winding walks and roadways are now being put in. Other very noticeable improvements have been made during the year. The agricultural grounds, under charge of Prof. Hilgard, are in excellent shape and afford the visitor a good opportunity for the study of many important and interesting industrial growths.

The report of the College of Agriculture for 1886 is now being printed at the State office in Sacramento, and will soon be ready for distribution. It will contain much information on chemical examination of California soils, water, products, on forage plants, economic entomology, rare trees and plants, orchard fruits, etc. It will be sent free to all who apply for it.

BAD BOYS.—It is reported that Senator Routier has tried Sacramento boys at splitting apricots for drying. He had 20, and the Bee says the boys were lazy, shiftless and troublesome. He then advertised for "boys who would work and not play." He has not received a single answer. The work is easy, pleasant and clean, and the boys can make 75 cents per day and be boarded. "I am sorry to say," said ex-Senator Routier, "that the California boys don't seem to want to work. It is the fault of the parents, who do not train them properly. I am almost disgusted, but I will never allow a Chinaman around my premises if I have to tear up every tree on the place."

OLEOMARGARINE.—It is telegraphed from Washington that an effort will be made next Congress to secure the reduction of the retail dealers' tax for the sale of oleomargarine. It is claimed that there is no intention on the part of the oleomargarine men to ask for a reduction of the tax upon the article itself, but it is claimed that the retail dealers' license is excessive. The Commissioner of Internal Revenue is said to be of the opinion that there is some justice in the claim. The internal revenue receipts show that the tax has not diminished the sale of the article.

California Seedling Cherries.

Three years ago Mr. Leonard Coates of Napa introduced the "Centennial" cherry, a seedling of Napoleon Bigarreau, raised by Mr. W. H. Chapman. Since then Mr. Coates has made arrangements with Mr. Chapman by which he is propagating at his nurseries three other seedling cherries, all of California origin.

We are enabled now to give not only a de-

"Purity" is the name given to a beautiful cherry of waxy, transparent appearance, a seedling of "Elton." It possesses the delicacy of flavor of its parent, but is more rounded and does not bruise so readily. It ripens about one week before Napoleon Bigarreau, and therefore comes in at a season when it can be best used by the canners.

It is immensely prolific and bears regularly. Its seed is very small. Its chief attraction,

more than a carload of "Centennial" and "Black Mastodon" cherries?

The original trees of these three varieties are grand and symmetrical specimens about 10 to 12 years old, and of great vigor.

The method of raising these seedlings is as follows: When the fruit of a variety from which it is desired to raise a seedling is mature, but not overripe, a dozen or two of the largest and most perfect specimens are carefully picked,

fect specimens; and (3) never allowing the seeds to be exposed to the air.

Poisonous Milk.

Referring to an article given on another page concerning the danger of disease and death lurking in unclean milk, we cite the fact which has already been hinted at in the *RURAL*, that science has disclosed the specific poison to which may be attributed part of the evil effects. This is, of course, distinct from the evil work of bacteria or disease germs, which we have shown are found in the milk of cows suffering from tuberculosis and the like. R. H. Firth in the *Lancet* gives the following: An epidemic of attacks of violent purging and vomiting among the soldiers in the Punjab was traced to the use of certain milk. The residue of the suspected milk was found to be of sp. gr. 1.025; casein, 4.1; fat, 3.9; and sugar, 5.04 per cent. The dairy pans were found to be unwashed, and some emitted a repulsive odor; the weather at the same time was very hot. The milk was coagulated, filtered; the filtrate was neutralized and made feebly alkaline by potassium hydrate, and shaken with ether. On evaporating the ethereal extract, a crystalline residue of sickly odor and pungent taste was obtained. Given to men in small quantities, it produced nausea and headache, and caused violent purging and vomiting with dogs in 15 minutes. Milk tested in a similar way gives negative results. Eight samples of milk were allowed to stand, and were tested every 20 days. After two months, three of the

FIG. 1.—BLACK MASTODON.

FIG. 3.—CALIFORNIA ADVANCE.

THREE NEW CALIFORNIA SEEDLING CHERRIES ORIGINATING IN NAPA COUNTY.

scription of these cherries, cuts of which appear in this issue, but also the method by which Mr. Chapman has been so remarkably successful.

The "California Advance" is a seedling of Early Purple Guigne. It ripens fully one week earlier than its parent, the Early Purple Guigne, is larger and of more obtuse rounded form, and a much heavier bearer. This makes it of immense value, particularly in the early fruit sections, where one week in advance of the hitherto earliest variety will mean thousands of dollars in the profits of the growers.

In color it is dark purple, turning black when fully ripe; in flavor, rich and sweet, and of a good degree of firmness.

however, is its wax-like appearance. It bids fair to make an extremely profitable and elegant canning cherry.

The last of the three is "Black Mastodon," truly a mammoth specimen. It is a seedling of Pontiac, and, ripening about with the "Centennial," Mr. Chapman first designated it by the name of "Black Centennial," but afterward gave Mr. Coates the privilege of naming it, who decided on "Black Mastodon." It is not so heavy a bearer as the two preceding, at least in Napa, but makes up for that in its size. In texture it is very firm and meaty, which will make it one of the most valuable shippers. What will take the eye of our Eastern friends

with the stems on, and laid upon a layer of moist, fine creek sand in a shallow box, covered with another layer of sand, and the box buried in a shady, cool place along the creek bank until the fall. After rain enough has fallen to prepare the land, the seeds are carefully planted, with the sand around them. The finest looking trees raised from these seeds are transplanted the following fall to the orchard, and, in order to get fruit as rapidly as possible, grafts are taken from them and inserted in some old, bearing tree.

This is all that is done, the points being (1), great care in handling the fruit and picking it at the right time; (2), selecting the most per-

samples yielded the same crystalline substance which produced the same symptoms when given to animals. This substance, which seems to be a ptomaine, is evidently the result of decomposition. No specific organisms on which to fasten it beyond some common forms of oidium and penicillium were found.

RAILROAD LANDS.—Under the recent orders of Secretary Lamar, 25,000,000 to 30,000,000 acres of railroad indemnity lands will be opened to public settlement.

On the 8th of November next the people of Oregon will vote on a constitutional amendment prohibiting the liquor traffic.

HORTICULTURE.

The Apricot in California.

Continuing our report of the last meeting of the State Horticultural Society, we come now to the stated subject,

The Apricot.

The discussion on the apricot was opened with the following essay by Judge W. C. Blackwood of Haywards:

The apricot is said to be native to Armenia in Asia, and introduced from that country into Western Europe by the Romans. It is on its native stock a long-lived tree. Mr. John Wolfskill of Winters told me some years since that at Santa Fe, New Mexico, there were trees 80 or 100 years old still vigorous when he knew them, some 20 years since. Cultivated on the peach-root, I am unable to say how long they will last. In an orchard I planted some 30 years ago, there were some apricots on peach-stock. The most of these trees are still there, and seemingly as vigorous as ever.

Soil and Climate.

A moderately moist loam is the best for the growth of the apricot. Too much moisture is ruinous. A clay soil is not good. The tree seems to thrive best where it has a moderate exposure to the ocean breezes and genial warmth of temperature; hence the wonderful success which has attended its culture around the bay of San Francisco and coast counties further south. Its cultivation has never been made successful in the Atlantic States, and it does not succeed very well in many of the interior counties in our own State. The climate of the interior seems to be too dry and hot, and if artificial irrigation is resorted to there the gum disease develops and the fruit, when ripe, is watery and deficient in richness.

When climate and soil are favorable the tree is subject to few diseases. In the vicinity of Haywards, where the tree has been successfully grown now for 30 years or more, no disease has ever developed, and it is singularly free from being attacked by insect pests.

Varieties.

The books describe some 20 or more varieties, many of which have been experimented with in this State, and the most of which have been discarded as unprofitable for general market purposes. Of the older varieties cultivated in this State none seem to retain their hold on popular favor except the Moorpark and the Royal. The Hemsikirke, the Breda, the Peach and Du Bois' early are no longer cultivated to any extent by nurserymen in this State.

Then we have some new varieties to which public attention is occasionally called. The St. Ambrose is a new variety. From what I have seen of it I think it hardly equal to the Royal. There is the Siberian or Russian, favorably spoken of by nurserymen of Kansas. It is about the size of the Breda. Its chief excellence seems to be its hardiness, and it is said to stand as much cold and frost as the peach, and blossoms about the same time. It probably will now become popular in this State. There have been some new varieties originated in this State. Of their claims to popular favor I know nothing and can say nothing.

The Moorpark originated in England. It is an old and highly esteemed variety for its enormous size and excellent flavor. In some portions of the State it is said to be a regular bearer, but in the country around the bay it is an uncertain bearer, producing full crops only once in four or five years. For canning purposes it is objectionable by reason of its ripening on one side first, but for drying it has probably no superior.

The Royal, introduced into this country from France, is for all purposes, perhaps, the best apricot cultivated by our orchardists. It is an immense and a constant bearer, and, when the fruit is properly thinned, it attains a full medium size. It ripens evenly and assumes a rich orange color with a red blush on the side which is exposed to the sun in ripening. It does not commence to decay as soon as the Moorpark—in fact, I have seen it dry on the tree instead of rotting. For canning or shipping long distances it has no superior, and, when dried, it makes a beautiful light-colored fruit; and, as for flavor, it is among the best.

The Blenheim is another favored variety. It is of a beautiful lemon color when ripe, and in size about the same as the Royal. The skin of the Blenheim is very tender and is easily broken. As for flavor, I think it has no superior. It is valuable for canning or drying. The tree is a vigorous grower, covering itself well with broad leaves, but when young is apt to cast the most of its fruit. When it obtains age it bears well and seldom needs thinning out. There is another variety of apricot, called by some the "Blenheim." This variety bears quite young, is a good apricot; but not as vigorous a grower, nor is the foliage as dense as the first variety I have described. From descriptions found in the book I think it is not a true Blenheim.

In conclusion, I would say California would seem to have a monopoly of the apricot business, although it is grown in some other portions of the United States. When properly dried, it is among the best of our cured fruits,

and among the canned varieties it has no superior. The cultivation of the apricot in those portions of the State adapted to its growth will, I think, always be profitable to the orchardist.

Discussion.

A general discussion on the apricot followed the reading of Judge Blackwood's essay. Mr. Hathaway of San Lorenzo said he had been told by one of the large canners that he regarded the Blenheim as the coming apricot for canning.

Mr. Coates of Napa exhibited samples of apricots—Royal—of large size, dried in his new "Common-Sense" fruit drier in four hours. Some other parties had dried Royals by the same process in two and a half hours. The market demands bleached fruit, and as long as it does it will have to be supplied. There is a growing prejudice against the use of sulphur in bleaching fruit on account of its destroying the flavor. Fumes of sulphur are injurious unless used with great care. The public will have to be educated to natural-colored fruit. Dealers all demand bleached. The fruit he exhibited had not been bleached through any sulphurous process. Usual time for drying apricots in driers is from 8 to 12 hours. He has done it in from 2½ to 4½. Driers usually do two batches in 24 hours. In the sun it takes two days or more.

Mr. Shinn: What are the best varieties to be grown in this State? Shall we ship East or dry fruits? All these are proper subjects now for discussion and the subject cannot be exhausted. One variety may be best for canning and another for drying. He had seen dried apricots from Ventura county at the Mechanics' Fair, did not know what variety, but larger than those shown. He was told that the grower had dried 100 tons; sold it at 25 cents per pound at the wharf. Subject of dried apricots exceedingly interesting. Apricots are selling now at \$30 per ton; if dried can they be sold at 15 cents per pound? We have all the world a market for our canned goods. There are but few countries in the world where the apricots are produced at all—Spain and Portugal the principal countries. Year after year the demand for apricots from the Eastern States increases. As to what section of the State is most fit for their production, it is said the coast countries have a great advantage, and that the interior and southern parts of the State are less suitable for them.

Judge Blackwood regards the Moorpark where it succeeds regularly as the best and most profitable apricot grown in the State. It is large, rapidly handled, rich fruit. It always finds a ready market because of its richness. He regarded sulphuring fruit as a damage, but trade demanded bleached fruit. Had talked with a dealer who told him to sulphur fruit 20 minutes. It would not be fit to eat when cooked if done so long. They all want white fruit, but when a man uses bleached fruit once or twice, he won't use it any more. Now I hold that this thing of sulphuring fruit is just adding poison to the fruit according to the length of time you sulphur it. Sulphuric acid is deleterious to health, as every physician knows. Time is coming when this sulphured fruit will be dropped. I am going to dry fruit this year, and am going to sulphur it, but I don't like it. The Royal for all purposes will retain its place as a popular variety. It can be shipped long distances; will hang on the tree for a long time; it will wait some days for you to handle it after it is ripe; is a rich fruit. Blenheim known here by that name does not answer the description of the fruit by that name given in the books. My Blenheims are bright lemon color; skin is easily abraded—has got to be handled carefully, or shows bruise stains. It is good for canning; think it will be good fruit for drying.

Mr. Shinn: Is the Moorpark a good bearer? Mr. Blackwood: Bears pretty regularly, it is said, in Ventura county. I have had trees in my orchard 14 years, and but two crops from the trees. They do not pay for the room they occupy. This year they were very full; had to thin them out.

Mr. Shinn: This is very important. People do not care to grow trees that way. Hemsikirke is a good bearer. I never heard but a single objection to the Royal, and that is its size. Royals are very small this year. Blenheims are a degree larger.

Mr. Shinn: The Blenheim is about one-half larger than the Royal.

Mr. Blackwood: Thin out the Royal and it will be larger than the Blenheim. Heat has affected them this year.

Mr. Shinn: I will suggest to young orchardists to make efforts to grow seedlings and obtain just the kind of apricot for our use. To obtain seedlings, plant pits of Royals and see if good qualities cannot be added to it.

Mr. Tompkins: This thinning of Royals is a very serious objection; it is about as expensive to thin them as to pick them. The Blenheim is larger and does not need thinning. It is uniformly much larger than the Royal; and, when dried, is better than the Royal. Thinning is a very serious objection.

Mr. Shinn: Mr. Barbour of San Jose states that both the Royal and Blenheim or Shipley ripen uniformly; ripen freely, etc. I fear the St. Ambrose will be a shy bearer—more shy than the Moorpark.

Mr. Blackwood: Mr. Collins had me visit his St. Ambrose orchard and showed me trees with fruit on. I would not recommend them. They are not as good as, and cannot be compared to, the Royal. They do not bear as well.

The Shot-Hole Fungus.

The following letter was read:

CHICO, June 22, 1887.

Mr. E. J. Wickson, Secretary, and Gentlemen of the State Horticultural Society: Nothing would give me more pleasure and profit than to accept your invitation to be present at your meeting of the 24th, and tell you "what I know about the apricot." But as tons upon tons will turn from green to ripe this week, it is necessary that some of us stay at home and push things to save the crop. We who do stay at home move a vote of thanks to those who will attend the meeting, and the rest of us will profit by reading their sayings in the RURAL PRESS, (Long may it live!)

The diseases of the apricot are very few so far as my knowledge goes. Trees do and will die without any apparent reason. They usually leaf out in the spring, set full of fruit; afterward the leaves turn yellow, the fruit prematurely ripens and the tree is gone. Sometimes this will occur around a defined spot until one-fourth or one-half of an acre has been left without a tree. I suppose these are alkaline spots, but why trees will do so very well for two or three years on these same places and then succumb, I am not able to say.

The "shot-hole fungus" is the worst disease on the apricot that I know of. The first I saw of it was four years ago, in an orchard one and a half miles from Rancho Chico orchards. I brought samples to Dr. Harkness, who was visiting General Bidwell at the time. He said it was a fungus of some kind, and thought it was to be occasioned by the very sultry north wind we were having at the time, and which was preceded by cool, damp weather. He was of the opinion that it would not spread to do much damage, but it has continued with us yet. A few weeks after finding the fungus in the orchard spoken of, I found on Rancho Chico two rows of very old Moorpark badly affected. They were right in the course of the wind from the other orchard. Two years ago I cut off all of the tops of these two rows and sprayed with strong soap and sulphur. There is now a good top and a good crop. Some of the fungus is to be seen, but it is not nearly so bad as before. I will send you a box of apricots; by it you can see what it will do, if you do not already know too much about it.—G. M. GRAY, Rancho Chico.

Mr. Tompkins: Fruits not classified enough. One nurseryman will show you one kind and call it Royal, another will have a different name. Even in the best nurseries, vary from a large Royal to large Blenheim. Should be classified. Division of opinion over a peach from Chico last year as an instance.

Mr. Shinn: Fruits in a perfect muddle in this State. Standing committee of State Board of Horticulture three years ago to work up this subject, but expect will not hear anything more about it. American Horticultural Society worked many years for it and brought something out of it, but not very much. Any remedies for diseases?

Judge Blackwood: Dr. Kimball dusts with quicklime when the fungus is beginning to show itself. It is not deleterious to the fruit.

Mr. Wickson: It is probable that the sulphide whale-oil-soap remedies for fungus for pear, apple, etc., would reduce the fungus on the apricot. Applications should be made in the winter-time.

Propagation and Planting.

Mr. Tompkins: What are the best trees to plant—yearlings or two-year-old trees?

Mr. Shinn: There is difference of opinion in that matter. Apricots ought to be planted at the age of one year, although many prefer two-year-old trees. It seems to me that a tree two years old is better able to bear the shock of rupture and removal than a younger tree. That is my philosophy, but the general opinion of planters is in favor of one-year-old trees.

Mr. Tompkins: What root would you put apricot trees on?

Mr. Shinn: Apricot root is good for apricot. I advocate for each tree its own root, all other things being equal. I cannot be moved from that position. There are, however, exceptions to the rule. Situation may make an exception. Some pears may be best grown on quince roots. On certain classes of soils the apricot tree should be on the plum root, because the plum root will live in moist soil than apricot. Will make that exception. On my place there is a row of apricots grafted on plum, more than 30 years ago. The trees are not the size of others on apricot root, nor have they borne as full as those upon apricot or peach root. The apricot does well on the peach. If the land to be planted on is good peach land, put on peach root. One objection is that gophers like apricot root, while the peach root is too bitter for them. Must destroy gophers if they like apricot root.

Mr. Blackwood: Gophers work at night; travel at night. Make sure of him and he is not there. They are hard to kill.

Mr. Shinn: As for age of trees, I believe cherry, apple, plum and pears may be planted at two years, if the trees are not overgrown; they are better able to recover from the shock than yearlings are.

Mr. Blackwood: The apricot on the peach gives long life to the peach stock. In the old orchard I planted peach and apricot trees at the same time; the peaches all gone and apricots still vigorous.

Mr. Perkins: I have an orchard one-half planted with one-year-old apricot trees, the other half with dormant buds. They are now five years old and are all the same size. I did the same with the peach, and now the dormant buds are ahead.

Mr. Tompkins: There is other experience to the same effect. Trees in dormant buds set five years ago were ahead of year-old trees planted the year before them.

Mr. Shinn: I never had good luck in trans-

planting dormant buds. Sent East for them, they being scarce here, but two-thirds died; did not get as good trees as those budded here. They had been carried too far in dormant buds. Do not recommend that method. It will make sprouts very badly. You have to develop that bud, and, unless the sap flows pretty freely, you will not get the bud you want.

Mr. Wickson asked that a committee be appointed to report on the apricot brought by Mr. Trumbull.

Mr. Shinn: If superior to the Pringle, it ought to supersede that almost worthless variety.

Messrs. Tompkins, Coates and the secretary were appointed the committee.

Cold Storage.

Mr. Lelong: Apricot crop seems to be largest; peach crop next. They seem to have thinned and cultivated fruit more properly. As to manner of handling, could not give any information at present. Was told if cold storage could be got up as at Riverside, that the demand would be still larger for green fruits; otherwise, canners combine and pay what prices they deem best, and fruits suffer on that account. Letters from cold-storage works give no encouragement to come here to start works.

Mr. Allegretti: I have made propositions to some people of Alameda and Santa Clara counties of a way by which there may be a great deal of the crops stored away. I can put up for \$5000 works large enough to store 100 tons of fruit. By storing it away it can be shipped East, and sold as green fruits in New York three months after the season is over.

A member: Mr. Allegretti wishes to organize a company to establish works for the treatment of fruits. All fruit-growers ought to encourage him.

Mr. Tompkins: Peaches go very well without treatment if properly handled. At Vacaville and Winters they have shipped them for years. An enterprise for fruit storage ought to be started in the winter to have time to prepare it.

Mr. Lelong: Works can be put up in two or three weeks.

Mr. Shinn: Farmers are slow, conservative people and do not take to new ideas readily. They must lose fruit before they would take to new ideas.

Mr. Allegretti: The expense nor time required would not be much; I am willing to share myself the burden of putting up a large house. I have one that will hold 50 tons. I have discussed this matter and solicited people to go into it. When the fruit comes in, store it for two or three weeks and not glut the market. It would sell to canners just as they could use it, and not be put in the market for people to buy at any price. It costs a very small amount; a house can be put up in two weeks for 100 or 150 tons. I will put my share in, and not expect any royalty.

The subject for discussion at the next meeting will be "The Peach; Its Culture and Marketing."

State Board of Horticulture.

A meeting of the Executive Committee of the State Board of Horticulture was held at the office of the board in this city on June 30th. The meeting was called to order by President Cooper. There were present, Commissioners Ellwood Cooper, Dr. Edwin Kimball, A. Block.

On motion of Mr. Block, Tuesday, Nov. 8th, to Friday, 11th, inclusive, was the date fixed for the holding of the Eighth State Fruit Growers' Convention, at Santa Rosa, under the auspices of the State Board of Horticulture.

The president then appointed Gen. M. G. Vallejo and Dr. Kimball on Committee of Arrangements. Mr. W. G. Klee was instructed to assist the committee.

On motion of Mr. Block, State Inspector Klee was authorized to procure the assistance of a chemist to experiment, to discover, if possible, a process by which the orchardists of this State can manufacture their own caustic soda, having all the necessary ingredients on this coast, and to file a full report thereof at the convention.

On motion of Dr. Kimball, it was ordered that the board shall meet at the office of the board in San Francisco on November 7, 1887, at 10 o'clock.

State Inspector Klee and Dr. Kimball were authorized to have made 10 analyses of fruit sprayed with arsenites, at a cost not to exceed \$100.

On motion, the program for the forthcoming convention was referred to the president.

On motion, the appointment of standing committees for 1887-88 was also referred to the president. The following gentlemen were requested to prepare essays on the following subjects, to be presented at the convention:

W. H. Aiken, on Prunes; Milton Thomas, on Crystallized Fruits; A. T. Hatch, Suisun, on Fruit Unions; A. Scott Chapman, San Gabriel, on Orchard Fertilizers and on Fumigating Trees with Chemical Gases for the Destruction of Insect Pests; W. A. West, Fresno, on the True Smyrna Fig; W. M. Williams, Fresno, on Fruit-Drying; S. F. Leib and Geo. A. Fleming of San Jose, on Fruit-Drying; Dr. Edwin Kimball, Haywards, on Dates and Apricots; N. R. Peck, Penryn, on Orange Culture; I. A. Wilcox, Santa Clara, on Small Fruits; Prof. Hilgard and W. G. Klee, on Insect Pests and Remedies; Ellwood Cooper,

Santa Barbara, on Olive Culture; H. Weinstock, Sacramento, on Railroad Transportation.

On motion, it was ordered that the rooms offered by A. Hayward, at 224 Sutter street, be accepted for the use of the Board for offices, provided that they can be had for two years, with the privilege of five. On motion, the committee then adjourned.

B. M. LELONG, Secretary.

English Gooseberries.

EDITORS PRESS:—Experience with English gooseberries was called for a week or two ago. I imported a dozen rooted plants from Carter & Sons, Holborn, London, two years ago. Coming late in the spring, more than half were spoiled in transit or by careless handling.

Four good bushes this season bloomed vigorously and set fruit. Heavy mildew appeared on the point of one twig, and I sulphured all the plants freely. The fruit grew and attained a fair size, but began to show mildew. A few days later, as the mildew was spreading, the bulk of the fruit was picked. That remaining on the bushes developed a complete heavy white coating, while the leaves and twigs were unaffected. Subsequently the mildew turned brownish and peeled off, leaving fruit stunted and scarred, but still growing. It would be of no value for market, nor does it look inviting for home consumption. The fruit first picked made very good pie material, or "gooseberry fool" (an English dish composed of stewed gooseberries and custard or cream); but it was rather green and hard for market, though the berries were larger than the ordinary California market gooseberry. The leaves and twigs still look vigorous and healthy, the mildew having been confined to the berries.

The mildew cannot be attributed to any undue supply of water, as I have irrigated the bushes but rarely.

I am also experimenting with a new English black currant, the Black Champion, whose berries grow in bundles like the ordinary cherry-currant. The trees are now bearing, and promise well. Some Kentish filberts of same importation also show a few nuts this year, and the trees appear thoroughly prosperous.

EDWARD BERWICK.

Carmel Valley, Monterey.

[The behavior of the gooseberries seems to depend much upon local conditions. We know growers who grow the large English varieties without mildew, or have done it in the past. Robert Ashburner of Baden Farm, San Mateo county, has brought us fine, clear fruit, and N. Wageneller of Ukiah has been successful. —EDS. PRESS.]

IN A CHANGING WORLD.—Geologists have described Britain as swarming with a multitude of forms of gigantic reptiles, some of them 60 feet or more in length, during the reptile age—the middle period in the earth's geological history, when mollusks and reptiles attained their culmination and declined, and when the first mammals of England at a later epoch—the middle of Quarternary—is given by Owen: "Gigantic elephants of nearly twice the bulk of the largest individuals that now exist in Ceylon and Africa, roamed here in herds, if we may judge from the abundance of their remains. Two-horned rhinoceroses, or at least two species, forced their way through the ancient forests or wallowed in the swamps. The lakes and rivers were tenanted by hippopotamuses as burly and with as formidable tusks as those of Africa. Three kinds of wild oxen found subsistence in the plains. There were also gigantic deer, wild horses and boars, a wild cat, lynx, leopard, a British tiger larger than that of Bengal, and another and even more terrible carnivorous monster with saber-shaped canines eight inches long. Troops of hyenas preyed upon carcasses and feeble quadrupeds. There was a savage bear larger than the Rocky Mountain grizzly, a gigantic beaver, wolves and various smaller animals, down to bats, sholes, rats and mice."

DIRECT ABSORPTION OF NITROGEN.—Berthelot, in *Compt. rend.*, has the following: Soils were placed in vessels of glazed earthenware, and in some cases were protected, in others exposed to air and rain, the rain-water being collected and analyzed, and the amount of ammonia and nitric acid in the air being also determined. The results show that vegetable soils continually absorb nitrogen from the air, even when they are not supporting vegetation. The amount absorbed is in all cases very much greater than the quantity of nitrogen existing as ammonia or nitrogen oxides in the air or rain. In fact the rain removes from the soil in the form of soluble nitrates considerably more nitrogen than it brings in the form of ammonia. At the same time, the amount of nitrogen absorbed is far greater in the case of soil exposed to rain than where soil is protected, probably owing to the greater activity possessed by the nitrogen-absorbing organisms under the former conditions. In the majority of cases, a notable proportion of the absorbed nitrogen is converted into nitrates.

TIMBER FIRES.—The recent forest fires in Michigan are said to have caused a loss of \$7,000,000 in values and eight human lives.

THE LUMBERMAN.

Acacia vs. Hickory.

As we have no hickory in this State and are growing many species of acacia, the following from the *Carriage Monthly* is of much local interest:

The following criticism of hickory timber was made by a correspondent of *Der Chaisen und Wagenbau*, of Munich, Germany:

"Hickory timber cannot by any means be replaced by any other of the foreign timbers. It is true that the hickory timber especially used by us for wheels, on account of its toughness and durability, as compared with other timbers, is greatly liked for use on our best carriages; but on the basis of repeated observations and experiments, we assert that German timber, specially for spokes, can be placed side by side, and is equal, considering the same conditions, to that of American hickory, the grade we refer to being the acacia timber. If I am not mistaken, in Northern Germany it is less known, but in Southern Germany it is used in preference to hickory, while in Northern and Southern Germany hickory timber is bought and used for all fine carriages. There are in Germany and Switzerland many carriage-builders who do not use hickory, not because of the price, but on account of its future durability; they do not like the hickory, and not without cause. The toughness of the recently cut timber is out of the question; but the quality of the acacia timber when in use for wheels and kept dry always keeps the same, while the hickory has the disadvantage, even when painted, of becoming porous on the inside.

"An old, experienced carriage-builder, with whom I had occasion to speak in regard to hickory timber, said, with decision, that when the hickory loses its freshness the wheels will become wormy; this is a worm peculiar to that timber. I have also noticed the removing of hickory spokes and replacing with acacia spokes on account of being worm-eaten. It would be interesting if our South German friends would advance their opinions with regard to acacia timber, as there are many who know the qualities of that timber thoroughly, and can give a correct judgment on the question, whether acacia timber is as good, if not better, than American hickory."

To this communication the publisher of *Der Chaisen und Wagenbau* replied as follows:

"Yes, acacia timber is better for spokes than hickory; but there is not sufficient of this timber in Germany for all the wheels required. Acacia timber is glass-hard, and, as proof of its superiority, all the omnibus wheels of Lyons and Paris, France, are made of it. We recently saw in Munich the sorting of hickory spokes, and very many were worm-eaten—out of three sets but one good set could be used. Then, again, we have finished wheels made of ash from 10 to 16 years old in which no worms had appeared. We Germans cut timber in the right time, but in America they cut it at any convenient time. Anything foreign is appreciated by us sooner than our domestic goods, but we have come at last to see things in their proper light."

The quality and use of hickory timber is much better known in the United States and Canada. There is no better timber for wheels, and especially so for light wheels. It is close-grained, tough, and has the required elasticity not to be found in any other timber. It is true that it loses its toughness with age when in use on a carriage, but this is also the case with all other timbers, much depending on the climate or atmosphere, as the more exposed to dampness the more porous it will become; but when well covered with paint, which excludes the air, its quality remains the same. Almost all carriage spokes used in France are made of acacia timber, with the exception of the hickory spokes imported from the United States. Acacia makes good spokes for heavy carriages where no elasticity is required, and gives a very good finish when painted, as it is close-grained, but will rot very fast if the water penetrates on the inside tenons. Oak is far superior to acacia, as it will not rot and is tough, second oak, in fact, grading next to hickory. When acacia timber has been wet but a short time the tenon will break off very easy; and if used for our lighter grades of wheels, it would not stand the necessary use at all.

Lumber in Southern California.

The great boom in Southern California has created a demand for lumber, and the mills on Humboldt bay are actively engaged in filling orders. The price of the commodity has been raised and rates of freight are up to \$7. Vessels are scarce, and a fleet sufficient to carry away the output cannot be obtained. Sunday, a vessel in port which arrived without charter was offered \$8 per thousand feet to load lumber for San Pedro. Many of the shipyards on the coast have all the work they can attend to, building schooners for the coasting trade.

It is claimed by our contemporaries in the southern portion of the State that the boom there and the consequent increased demand for lumber has been one of the chief moving causes in the recent advance in the price of lumber throughout the State.

A correspondent of the *San Bernardino Index* in speaking of this advance in prices says: It

looks as though the growth of this section is likely to be arrested by the continued and unreasonable advance in the price of lumber. There can be no additions to our population without building, and the capitalists who handle the lumber supply have kept raising the price until it has become almost prohibitory.

There are illimitable forests of redwood and pine north of us, reaching as far as Alaska, yet lumber is sold for almost its weight in silver, and the price is advanced every few days "as much as the traffic will bear." Unless a remedy can be found for the existing corner in lumber, the great immigration we are looking for next winter will find no foothold.

I suggest two measures: 1. The starting of brickyards and substitution, so far as possible, of brick for lumber as a building material. There is no limit to the production of brick almost anywhere in our valley, and, so far as used, it will diminish the demand of lumber. 2. Let some gentleman with pluck and capital enter into competition with the lumber kings and procure lumber from some part of the world that is not controlled by the monopoly. By thus increasing the supply and diminishing the price a great impulse would be given to building, and consequently to our prosperity. Our future is intimately connected with the lumber question. Let it have a thorough ventilation in your columns.

The soundness of a log of timber may be ascertained by placing the ear close to the end of it, while another person delivers a succession of smart blows with a hammer or mallet upon the opposite end, when the continuance of vibrations will indicate to an experienced ear even the degree of soundness. If only a dull thud meets the ear, the listener may be certain that soundness exists.

Southern California Asphaltum.

The San Diego Mesas.

The following is part of a letter written by Carl A. Schenck and sent to the PRESS, after a short stay in San Diego and San Luis Obispo counties:

The old Spanish settlers and missionaries had a great veneration for saints. To rivers, mountains, valleys, churches—to many inanimate objects—this adjective is most liberally applied. Is this, perhaps, accounted for by the consciousness that men in general lack greatly in holiness? And is the said adjective used in this fashion to acknowledge and give reverend expression to the superlative impression which the grandeur of nature produces in human mind, doing honor at the same time and paying homage to such noble souls, who, in life, have sacrificed their own interests to the welfare of mankind?

The country around San Diego is built up in mesas or table-lands of light elevation with a much-worn material carried down from the mountains. Numerous creeks, which are now dry, have cut deep gulches into the beds of gravel and sand of post tertiary formation. The city of San Diego itself is built upon the long slope of such a mesa, running down to the beach with a gentle descent.

The asphaltum beds of San Luis Obispo consist of a sandy rock impregnated with the hydrocarbon. The size of the grains composing this sandstone is from fine sand to the thickness of a man's thumb. Taken fresh from the quarry, the rock looks dark-brown to black; in the heat of the sun detached pieces become soft and can be pulled asunder and the asphaltum drawn out in sticky fibers. Over miles of country are these hydrocarbonaceous deposits spread out with no other overlying formation than the fertile soil and the vegetation which it produces.

Have torrents of some hydrocarbon been active in this particular place in washing down sand and gravel, performing the disintegrating and removing work, in which water is generally the agent? or is the asphaltum a product of decomposition of immense growths of fungi and other sea-plants in loco?

Wherever the rock is bare of vegetation and where it stands out in bold cliffs it has been bleached superficially by the sun. Holes and small caverns are also disclosed in the structure of the rock at such places.

The hydrocarbonaceous substance is not evenly distributed throughout the formation, being more abundant in one place than in the other; the heat of the sun makes it ooze out of the ground in rich localities, forming a black, soft and lustrous crust which in shape reminds one of melted wax or tallow flowing down a gentle slope.

Nature has produced a material which is excellent for paving streets, not needing a previous admixture of sand or other substance.

Saving the Lawyers.

"The first thing we do, let's kill all the lawyers." This is rather a blood-thirsty proposition, which we modify by offering to cure this worthy class of people. Most of them suffer (in common with nearly all others of sedentary habits), from the injurious effects of dyspepsia, indigestion, piles, loss of appetite, and other ailments caused by a constipated habit of the body. Dr. Pierce's "Pleasant Purgative Pellets" eradicate all the disorders in promptly removing the cause thereof, and induce a rare degree of comfort and health.

Victory at Last.

Consumption, the greatest curse of the age, the destroyer of thousands of our brightest and best, is conquered. It is no longer incurable. Dr. Pierce's "Golden Medical Discovery" is a certain remedy for this terrible disease if taken in time. All scrofulous diseases—consumption is a scrofulous affection of the lungs—can be cured by it. Its effects in diseases of the throat and lungs are little less than miraculous. All druggists have it.

Too well known to need lengthy advertisement—Dr. Sage's Catarrh Remedy.

Consumption Cured.

An old physician, retired from practice, having had placed in his hands by an East India missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma, and all Throat and Lung Affections, also a positive and radical cure for Nervous Debility and all Nervous Complaints, after having tested its wonderful curative powers in thousands of cases, has felt it his duty to make it known to his suffering fellows. Actuated by this motive and a desire to relieve human suffering, I will send free of charge, to all who desire it, this recipe, in German, French, or English, with full directions for preparing and using. Sent by mail by addressing with stamp, naming this paper, W. A. Novas, 149 Powers' Block, Rochester, N. Y.

are constantly happening. A kick of a horse or cow may cause a bad bruise; the slip of an axe or knife may result in a serious cut.

Any of these things may happen to one of your family at any moment.

Have you a bottle of PERRY DAVIS' PAIN KILLER ready for use in such cases? It has no equal for the cure of Scalds, burns, cuts, swellings, bruises, sprains, sores, insect bites &c.—All Druggists sell it. PERRY DAVIS & SON, PROVIDENCE, R. I.

Lands For Sale and To Let.

Glen Cove Rancho for Sale.

This Rancho is situated at tide-water on the north shore of the Straits of Carquinez in Solano County, and comprises about 415 acres of good grain land. It is fenced and cross-fenced with five-board fence, and is well calculated for fruit raising. Has a young orchard of upward of 700 trees now well started; also a vineyard of 7000 vines of wine-producing grapes. The improvements consist of a large barn covering an area of 30x60, with 15-foot stables on either side; also a warehouse 30x60 for storing grain (with wharf) at tide-water, thus saving the expense of hauling grain for shipment. A wagon-house, a conservatory, sheds for storing machinery, hen-houses and inclosed yards, with a modern-built, two-story house with mansard roof and cellar under the whole structure, resting on an 18-inch stone wall; has 15 large, fine rooms, hard-finished walls, furnished with hot and cold water from two large cisterns and a spring upward of 100 feet above the house. Has a fine garden and pleasant surroundings; is about 30 miles from San Francisco and four miles from Vallejo or Benicia, with good roads by land and a pleasant sail by water. The prospective railroad from Santa Rosa to Benicia is expected to pass directly in front of the place, and a flag station is promised by said railroad company. The soil is of a rich loam and very deep. In point of health and climate no section of the State can surpass it. The live-stock and the farming implements will be sold, if desired, at very low figures. A rare opportunity is offered for any one who wants a very desirable place at a very favorable price. For further particulars apply on the premises or address, JOHN F. DEMING, Vallejo, Solano Co., Cal.

ENTOMOLOGICAL.

Paris Green vs. Arsenic.

EDITORS PRESS:—The statements which have been made from time to time in the PRESS that Paris green was a stronger poison than white arsenic, were so different from my experience in using large quantities of these poisons that I doubted the accuracy of the statements. In order to settle the matter definitely, I addressed letters to professors of various universities and Agricultural Colleges in different States, and lastly to the Chemist of the Department of Agriculture at Washington, through the Commissioner of Agriculture, asking for a definite answer to the question, "Which is the stronger poison, arsenic or Paris green?" From only two of these have I been able to get a satisfactory answer. I was surprised that some of the parties addressed should state that they could not answer my question, for the reason they could never discover any difference in these poisons. I had supposed that every chemist had in his laboratory some tests by which the relative strength of various substances could be positively ascertained. At all events, it seems to me they should be in possession of such knowledge.

Yesterday's mail brought an answer to my letter of inquiry from the Chemist of the Department of Agriculture, a copy of which I send you for publication:

The poisonous properties of Paris green depend largely on the amount of arsenic which it contains. Pound for pound, white arsenic contains a much larger portion of arsenic than Paris green. The actual poisonous effects of any toxic agent are largely controlled by the nature of the organism to which it is to be applied. Hence, in some cases, white arsenic, and in others Paris green, might prove a more powerful poison. In general white arsenic is to be considered, however, a more powerful toxic agent than Paris green.

The answer to my letter of inquiry to the president of the Colorado Agricultural College is substantially the same as given above. I am, therefore, still of the opinion that arsenic is a more deadly poison than either Paris green or London purple, and is much cheaper.

Santa Rita. J. S. TIBBETS.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 250 Market St., S. F.

FOR WEEK ENDING JUNE 28, 1887.

365,586.—CORN-POPPER—J. B. Davis, Santa Rosa, Cal.

365,508.—ENGINE GOVERNOR—Geo. E. Dow, S. F.

365,518.—ORE-FEEDER—J. & J. H. Hendy, S. F.

365,521.—SCREEN FOR FLUMES, ETC.—D. B. Hunt, Angels Camp, Cal.

365,754.—CAR-AXLE LUBRICATOR—Lyon & Munro, S. F.

365,632.—BRICK KILN FIRE-BOX—J. W. Read, San Diego, Cal.

365,544.—WAD-SORTER—Prentiss Selby, S. F.

365,558.—MOWER ATTACHMENT—A. White, Kerbyville, Ogn.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

SONOMA COUNTY LANDS.—L. W. Walker, about two and a half miles from Petaluma, is about to cut up 400 acres of land on the border of Marin and Sonoma counties into lots to suit purchasers, from one acre upward. The land lies on the road to Marshalls. It will be sold at about an average price of \$75 an acre. Mr. Walker has a full dairy ranch, stocked with 100 head of Jerseys. It has ample pasturage for that number and is in complete order for carrying on the business.

CHEMICAL WORK AT THE UNIVERSITY.—Though the laboratories in which public work is done will be closed during the University vacation, it will be possible to secure chemical work of private interest during the vacation by addressing Mr. G. E. Colby at Berkeley. He is a skillful analyst who will remain at the laboratory, and will prepare analyses of soils, waters, or any other materials for moderate charges.

THE BOSS FLEECE.—A merino sheep, owned by Reynolds & Danks, Summer county, Kansas, recently yielded a fleece weighing 53 pounds, the heaviest on record. He was clipped by an expert, who took six hours to complete the job.

Relics of '49.

EDITORS PRESS:—The following item, taken from the Nevada City Herald, is going the rounds of the press:

"Scattered here and there among the pines and thickets, along the streams that were mined away back in the fifties, are many lonely graves. The lapse of years has destroyed the stakes which once stood at head and foot, covered them with leaves, and in some cases trees are growing upon the little mounds, and in a few more years there will be nothing left to mark the resting-place of many a pioneer who died and was buried without the rites of burial. Many of these graves are lost to even those who once knew where they were, and in a few years there will remain to us nothing of them but memories. Along the banks of Deer creek, the Yuba and all other streams that were once remarkable for their richness, can be seen the sites of the cabins of the '49ers. Time has destroyed the walls and roofs of those cabins, but the level ground floors and the old stone chimneys, plastered with mud, still remain. These old chimneys are the only monuments left to mark the places where the pioneers lived through the stirring 'days of gold.' And even the chimneys are fast crumbling with decay. Vines, weeds, bushes and the mold which gathers about all old ruins have been slowly hiding them from sight."

Yes, and who of to-day cares? Scribblers of this era in too many instances picture the '49ers as men whose highest aim was to wash for gold, bear bowie-knives in their boots and revolvers girded about their waists, gambling their sport, with murder ever in their eye. There is wild romance in this and there is more bold in romance than manliness. So base have been the representations of the men of '49, that regard ceases to spring in the breast of the younger California population as they view the remains of the long ago. It is only those who knew the character of the men of the past who can cast an appreciative glance at the relics of '49. They honor the age. They love the times. They knew and appreciated the men—men of manliness; men of nerve; men of vim; of intelligence and brains such as never congregated as a population in any nation's history. It was the uprising of the energy and enterprise of the world—the emigration of 1849. They came, they saw, they delved; turned rivers, made mountain passes accessible, brightened the commerce of the world, gilded homes of every civilized nation. They built towns and cities, and crowned their labors by building a State, and all within 18 months. One by one the old cabins go to make room for the grander structure. This is as it should be. Onward the State must move, but as you level the homes of the '49ers, think of their occupants as brothers belonging to the heroic age of California. The State builds a monument to Marshall; the '49ers built their own monument—THE GREAT STATE OF CALIFORNIA.

ALMARIN B. PAUL.

San Francisco, June, 1887.

The Use of Geared Windmills.

As the utility, convenience, economy and durability of wind-power becomes better known, the demand rapidly increases, and the day is not far distant when a majority of the windmills put up will be geared for driving all kinds of farm machinery.

The accompanying illustration represents a Halladay Standard-geared windmill, erected on one end of a barn and as used for running the I X L feed mill, I X L corn sheller, I X L stalk cutter, wood saw, grindstone and pump, all of which goods are manufactured by the U. S. Wind Engine and Pump Co. of Batavia,

Wind Engine for Farm Use.

III. This company has made the manufacture of windmills and accompanying machinery a specialty for over 30 years, and is said to have the largest factory of the kind in the world, and scarcely a week passes during which time it does not make shipments to different parts of the globe.

We can cheerfully recommend this company and their goods as being perfectly reliable. This illustration also represents the Standard haying tools, consisting of the Noyes Anti-friction, Standard Four-wheel and Rod Hay Carriers, Grapple and Harpoon Hay Forks, etc., as used for mowing away hay. All of the above goods being also manufactured by the same company.

AMERICAN APPLES IN ENGLAND.—According to the statement of English journals, the apples received in England from this country, last year, sold for £700,000, or nearly \$3,500,000. Of this amount the Canadian fruit brought \$400,000.

Anderson Springs.

About these Springs a well-known journalist writes as follows:

Anderson Springs are second to none in America for refreshing and curative qualities.

They are to us the most beautifully situated, best shaded, romantic and picturesquely surrounded of all remedial springs favorably and generally known in California. The climate is decidedly cooler in summer than is usual in places of resort in Lake county, which seems destined to be the greatest and best sanitarium district of the whole Pacific Coast. It is notably beneficial to consumptives and asthmatics; for dyspepsia, rheumatism, dropsy, stomach, liver and kidney complaints, Anderson Springs are exceedingly valuable.

Beautiful streams of clear, cool water traverse the extensive natural and majestic groves. The waters are hot and cold, and contain sulphur, soda, iron and other purifying and invigorating qualities, in a remarkable degree. Some of the springs are very cold, effervescent, aromatic and altogether palatable and agreeable.

Important improvements have been added to the place each season since opened, and continuously kept, by the present ownership; during that time, the number of guests has annually increased.

This resort is a particularly desirable one for families and pleasure-seeking guests who desire rest and recuperation, with reasonable recreation and sociability.

Pure hot and cold water, and hot and steam sulphur baths, are free to all guests.

The board is exceptionally good, and the whole establishment is honestly and faithfully conducted, in a homelike manner, wholesome and gratifying to its large number and deserving class of visitors.

A large collection of cleanly kept cottages conveniently surround the hotel, providing pleasant accommodations for many guests.

These are facts concerning one of the most promising and natural gifted sanitariums in the world. Let no one be deceived.

Location, Etc.

Board, \$10 to \$14 per week. Route from S. F.—Take morning train to Calistoga, Napa Co., Cal. After arrival of train, stages leave Calistoga daily for Middletown, 17 miles; fare \$2. Private team to Springs, 4½ miles, \$1. Express and P. O. address, Middletown, Lake Co., Cal. Write for further information. J. ANDERSON, Proprietor.

BULL PUNCH OR TROCAR.—Mr. Burke, of 401 Montgomery street, an enthusiastic breeder and importer of Holsteins and Berkshires, has a sample Trocar just manufactured by his order in the East. They are strong, serviceable instruments and are claimed to be far better adapted to farmer's use than the fancy instruments usually costing from \$5 up. It is made of the best steel and provided with a silver-plated sheath. The punch is inserted in the nose before removing the sheath, the punch is then withdrawn leaving the sheath in the nose, the end of the bull ring is then inserted into the small end of the sheath, the ring being carefully pushed through, at the same time withdrawing the sheath; leaving the ring in the nose. The instrument is also very useful in severe cases of bloat. Its cost postpaid is only \$1. The advertisement will be found in our advertising columns.

Newspaper Agents Wanted.

Extra inducements will be offered for a few active canvassers who will give their whole attention (for a while at least) to soliciting subscriptions and advertisements for this journal and other first-class popular newspapers. Apply soon, or address this office, giving address, age, experience and reference.

DEWEY & CO., Publishers,
No. 252 Market St., S. F.

SUIT PENDING.—The Newark Machine Co. of Columbus, Ohio, owners of the patents of the "Imperial" Automatic Swing Straw Stacker, have brought suit in the United States Court of Chicago this week, against W. T. Shell of Polo, Ill., and Davis, Luthy & Co., of Peoria, Ills., in the sum of \$25,000 each, for building and offering for sale "Imperial" Automatic Swinging Straw Stackers that the Newark Machine Co. claim are infringing the patents belonging to them. It would be well for dealers and threshmen to beware of spurious-made stackers.

Easy Binder.

Dewey's patent elastic binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical file binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Record, Masonic Record, Harper's Weekly, and Scientific American, 75 cents; postage, 10 cents. Postpaid to subscribers of this paper, 50 cents. Send for illustrated circular. Agents wanted.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Cuts for Sale.

Duplicate cuts of illustrations appearing in this paper for sale by applying at this office.

BACK FILES OF THE PACIFIC RURAL PRESS (unbound) can be had for \$3 per volume of six months. Per year (two volumes) \$5. Inserted in Dewey's patent binder, 50 cents additional per volume.

A FACT.—With the King of Soaps the family washing can be done as easily as any other part of the household duties.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish, to those who pay fully one year in advance of date, 12 months the following articles (while this notice continues), at the very greatly reduced figures named at the right:

- 1.—The Agricultural Features of California, by Prof. Hilgard, 138 large pages, illustrated, cloth, with colored maps (full price \$1). \$0.25
 - 2.—World's Cyclopaedia, 794 pages, 1250 illustrations; (exceedingly valuable). .50

THE STATE FAIR

At SACRAMENTO, Cal., Sept. 12 to 24, 1887.

\$2000 in Cash for County Exhibits.

SPECIAL ATTENTION OF THE FARMING COMMUNITY

Is called, as well as the various Immigration Societies, Boards of Trade of the several Counties, and all others interested in bringing out the resources or their respective Counties, to the advantages offered by an Exhibition at the

STATE FAIR

Of the varied products of their counties. The supervisors of each county are invited to make a liberal appropriation, sufficient to pay the expenses of getting together an Exhibition of County Products. Premiums received can be returned to the treasury of each county making the appropriation, so that their respective counties would be written up and advertised at a small expense by an exhibition of this character. The Railroad Company transports the same free of charge.

THE LIVE STOCK EXHIBITION, connected with the State Fair, is sure to attract Eastern visitors anxious to view the resources of California.

APPLY FOR SPACE AT ONCE, as the Society is willing to devote the entire exposition building, if necessary, to displays of CALIFORNIA PRODUCTS. A NEW FEATURE has been added to the Premium List this year, in the shape of awards for a Sheaf Display of Cereals. Forty Sheaves, not less than 10 inches in diameter, of 10 varieties of grain are called for. Not necessary to be grown by exhibitor. Notice is now given that samples may be gathered during harvest, and laid away for exhibition. Address the Secretary for Premium Lists and other information.

S. H. MARKET REPORT

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, July 6, 1887.

The midsummer holidays interfered no little with general trade in country produce the past week. The weather has been and continues to be of the most favorable character, of which farmers are taking advantage by gathering their product as fast as possible. The English wheat trade has ruled quiet throughout the week. To-day's cable was as follows:

LONDON, July 6.—Cargoes off coast, quiet; cargoes on passage and for shipment, quiet but steady; Cal. wheat off coast, 39s 6d; Cal. wheat just shipped, 39s 6d; French country market, very heavy; Liverpool wheat spot, steadier; Liverpool wheat Cal. 7s 5½d to 7s 8½d.

Foreign Review.

LONDON, July 4.—The *Mark Lane Express* says: Under an unbroken drought the wheat crop promises above the average yield and is of exceptionally fine quality. All other crops in good soil look remarkably well. Spring-sown crops, on poor land, are withering. Trade in native wheat is growing worse. In London there is scarcely any offering yet, and sales are only effected at a decline. Sales of English during the past week were 15,697 quarters, at 33 shillings, against 36,246 quarters at 31 shillings during the corresponding week last year. Trade in foreign wheat was slow. Australian and American red winters are down 1 shilling. There were 7 arrivals of wheat cargoes; 3 were withdrawn and 4 remain. At to-day's wheat market, wheat at sales pressed values 1 shilling lower. Flour is 6 pence cheaper. Corn is steady. Barley is firm. Oats, owing to drought, are 6 pence to 1 shilling higher. Linseed is 3 pence cheaper.

Eastern Wheat Markets.

NEW YORK, July 6.—12 M.—Cash, 88c, July, 85½c, Aug., 84½c@84½c, Sept., 84½c@85½c, Oct., 84½c@85½c.

CHICAGO, July 6.—63½c for cash, 63½c for July, 71½c@71½c for Aug., 73½c@73½c for Sept., and 75c for Oct.

Crops at the East.

CHICAGO, July 3.—The following crop summary will appear in the *Farmers' Review* this week: Reports on yield of winter wheat now coming in corroborate our previous statements as to the shortage that might be expected. Missouri leads in her average and is followed by Illinois, while other States have the following relative position: Kentucky, Michigan, Indiana, Ohio, and last, Kansas, where the chinchbugs have done very serious damage. As yet reports on the average yield of the winter wheat crop are just beginning to come in, but the following from the different States probably furnishes correct indications of the result of the harvest: Twelve counties report an average of 17 bushels, and four counties place an average condition of 78 ½ ct. Nine counties in Indiana place the average at 14 bushels and three counties an average condition of 70 ½ ct. Seven counties in Michigan report the average yield 15 bushels. Eleven counties in Ohio report a yield of 13 bushels, while five counties report a condition of 85 ½ ct. The yield in 12 Missouri counties is 18 bushels, and the condition in three is 108 ½ ct. Five counties in Kentucky place the yield at 16 bushels. In Kansas, nine counties report an average yield of 11 bushels, and five an average condition of 55 ½ ct. Seventeen counties in Illinois complain of damage to the crops by drought. Like complaints come from six counties in Indiana, and 13 counties report damage from insects and drought. Rain is needed in Kentucky and Wisconsin, and six Missouri counties complain of drought. The condition of spring wheat in the different States is as follows: Seventeen counties in Iowa report an average condition of 74 ½ ct., while 13 counties in Minnesota place it at 75 ½ ct. Eleven counties in Nebraska report an average of 86 ½ ct., and the same number in Dakota place it at 89 ½ ct. As was expected, the hay crop turned out light and pastures were nearly everywhere dry. The prospects for the crop of apples in the West are fair to middling. In many places the fruit is dropping from the trees.

Eastern Wool Markets.

NEW YORK, July 3.—Values are very irregular for most grades, especially fleeces, with the best operating basis here still keeping below the plane of cost in the country. Old wools are nearly or quite gone.

The Philadelphia market continues quiet. A little better inquiry is noted, but it is either on wools of which there is not a sufficient assortment for active trading, or it fails to result in large sales, because of the unwillingness of sellers to make concessions. Among sales were 100,000 lbs. Territory fine, medium, at 22@23c; 33,000 lbs. Territory, fine, at 20c; 40,000 lbs. Territory, bucks, at 13c; 12,000 lbs. mountain medium at 26@27c; 5000 lbs. mountain medium at 20@23c.

The Boston market remains in an unsatisfactory condition. Among sales were 45,200 lbs. Territory at 17@18c; 65,000 lbs. Oregon, at 17@20c; 3000 pounds spring California, part at 21c.

NEW YORK, July 5.—Wool is quiet and generally steady. Domestic fleeces, 30@37c; pulled, 14@34c; Texas, 9@24c.

PHILADELPHIA, July 5.—Wool is quiet but steady and unchanged.

BOSTON, July 5.—Wool is firm and unchanged.

California Products at Chicago.

CHICAGO, July 2.—The potato market is dull and weak. The supply on sale is quite large, but there is very little demand, buyers not caring to purchase until after the 4th. Californians sold slow at \$1.50 to \$1.75 per hundred lbs. The stock of California oranges is about exhausted and the season is virtually over.

CHICAGO, July 5.—California green fruits are in good request and steady. The supply is also good;

prices quotable. Apricots, 20-lb. bxs, \$1.50@1.75; half crates, \$1.75@2.00. Peaches, 20-lb. bxs, \$2; Plums, choice, 20-lb. bxs, \$1.75@2.00; Plums, Peach, 20-lb. bxs, \$3@3.25; Plums, Royal, Hative, half crates, \$2.50@2.75; Pears, Beurre Giffard, \$2.50@3; Bartlett's, \$4.50@5. Stock in soft order sells at less prices.

California dried fruits are very quiet. The supply is small and prices steady. Pitted plums, evaporated, 10@11c; sun-dried, 10½@10¾c; apricots, evaporated, spot goods, 22@25c; evaporated, future delivery, 15@15½c; sun-dried, none here; prunes, 9@11c; raisins, London layers, 20-lb. bxs, \$1.40@1.50; loose Muscatel, per bx, \$1.25@1.30; California layers, per bx, \$1.25@1.30.

California Products in New York.

NEW YORK, July 3.—Fresh Fruit.—Auction sales of California fruits are proving attractive and profitable. On Friday 126 half-crates of plums sold at \$1.50@1.95, and 656 half-crates of apricots at \$2.05@2.30. Tangerines 75c per doz.

Dried Fruits.—California raisins are being distributed at the rate of 3000 to 5000 boxes a week, at full prices. Loose Muscatels, No. 2 Crown, \$1.20@1.25; No. 3 Crown, \$1.35@1.50; London layers, \$1.35@1.50.

Canned.—California pears are selling fairly at \$3@3.25.

New York Hop Market.

NEW YORK, July 3.—The market continues quiet. Dealers show no interest as buyers, except for moderate lots of goods that may be required for delivery to brewers on contracts, and brewers, it appears, are indifferent about making purchases. Medium grade States and Pacifics are held at about former prices, but meet with slow sales. Coast crop 1886, best, 21@23c; same, common to good, 16@20c; 1885, good to prime, 10@13c.

Local Markets.

BAGS.—The market appears to have a quieter feeling, although this may be due to the midsummer holidays. Calcutta Standard are quotable at 6½@7 cts.

BARLEY.—The market after the Fourth opened quiet, but the tone is strong, although there are many who look for lower prices, notwithstanding the short crop and heavy increased consumption. On Call to-day sales were as follows:

Morning Session: Buyer 1887—400 tons, \$1.17½ ct. Afternoon Session: Buyer 1887—300 tons, \$1.17; 200, \$1.17½. Seller 1887, new crop—100 tons, \$1.07½ ct.

BUTTER.—Choice hard, high-colored butter is hard to get. The supply of poor grades is very heavy and worked off slowly.

EGGS.—Strictly choice fresh laid are wanted, and command full prices. Off qualities are slow and low.

CHEESE.—Owing to Eastern competition, the market for Californian is narrowing, causing a lower range of values under a strong selling.

WHEAT.—Free selling of actual wheat is reported in the country, on the basis of our quotations. On Call the syndicate continues to take every ton of wheat thrown out by the bears. The latter failing to break prices by selling short are trying other tactics to send prices down, but the outlook at present is against them, for farmers are standing in with the bulls. On Call to-day's sales were as follows:

Morning Session: Seller 1887—300 tons, \$1.88½; 100, \$1.88½; 500, \$1.88½; 300, \$1.89; 200, \$1.89½; 600, \$1.89½; 100, \$1.89½; 300, \$1.89½; 100, \$1.89½; 200, \$1.89½ ct. Afternoon Session: Seller 1887—300 tons, \$1.89½ ct.

[COMMUNICATED.]

Market Information.

Cereals.

The following shows, as far as obtainable, last year's wheat crop in this State:

Exports July 1, 1886, to July 1, 1887..... 720,537
Local consumption..... 350,000
Stock in Call Board warehouse July 1..... 112,532

Total..... 1,183,069
Deduct.....
Stock on hand July 1, 1886..... 77,978
Receipts from Oregon..... 68,409 146,587

California crop..... 1,036,482

The quantity in farmers' granaries and also in interior warehouses, not Call Board warehouses, is not given, but then it will hardly go above 15,000 tons, which added to the above gives the crop at about 1,051,482 tons.

Below are given the highest, lowest and average prices of No. 1 wheat for each month of the past cereal year. Quotations are based on actual sales in the sample market, and not on Call Board figures.

Month.	Average.	Highest.	Lowest.
July 1886.....	1.24	1.27½	1.20
August.....	1.30½	1.37½	1.25
September.....	1.33½	1.37½	1.30
October.....	1.34½	1.40	1.30
November.....	1.39½	1.45	1.35
December.....	1.48	1.52½	1.43½
January 1887.....	1.57½	1.65	1.52½
February.....	1.50½	1.65	1.42½
March.....	1.58½	1.70	1.48½
April.....	1.70½	1.76½	1.67½
May.....	1.75	1.80	1.72½
June.....	1.80½	1.85	1.75
For the 12 months.....	1.52½	1.87½	1.20

The local wheat market has been inactive since Thursday last, owing to the holidays. Crop advices are fairly favorable, although continued shelling is reported, in some sections, heavy, but in the most of the others, light. Oregon advices continue favorable, with the yield east of the Cascades reported a full average to the acre.

Eastern mail advices are confirmatory of a light turnout of winter wheat, but spring equal to last year, which was 6,000,000 bushels more than in 1885. The visible supply on July 4 was 34,400,000 bushels; a falling off for the week of nearly 5,000,000 bushels.

The following are the latest mail advices from England: *Dornbusch's*, of June 17, says: "Days of golden sunshine and nights of high temperature have worked wonders in the aspect and position of

the cereal crops in the United Kingdom. Wheat is growing rapidly and barley and oats are flourishing apace, but the two latter want warm rain and plenty of it to bring them into prime condition. The season is still a fortnight behind the average, but taken all around the prospect is said to be more hopeful than it was at this time last year. In France the weather is very favorable and 'earring' is now taking place in the earlier districts. Germany and Belgium are also rejoicing in fine, brilliant weather, with a consequent improvement in the outlook for harvest."

Beerbohm, of June 17, says: "Another week of forcing summer weather has further greatly improved the appearance of the crops in the United Kingdom, and the progress of vegetation is as satisfactory as it is astonishing compared with the state of the plant a few weeks ago. It is true that the earing time is a full fortnight late, but with a continuance of the present weather, it is evident that the yield of wheat will likely prove superior to the short crop of last year. In France there has been an equally decided change for the better, and the outlook for the crops is now considered favorable for a fair average yield. In some parts of Germany there are complaints, but generally speaking the outlook in that country is also favorable."

Receipts of barley at this port the past crop season were 2,200,000 cts, against 1,115,079 cts the season of 1885-86. The exports were 925,664 cts against 219,886 cts the season of 1885-86. The average price of No. 1 feed was as follows:

Month.	Average.	Highest.	Lowest.
July 1886.....	.86 4-5	.97½	.77½
August.....	.88	1.00	.80
September.....	.90½	.95	.87½
October.....	.94½	.97½	.90
November.....	1.02½	1.07½	.95
December.....	1.05½	1.10	1.00
January 1887.....	1.12	1.20	1.02½
February.....	1.05½	1.17½	.92½
March.....	1.01½	1.07½	.95
April.....	1.08½	1.15	1.05
May.....	1.11½	1.20	1.02½
June.....	1.07	1.10	1.02½
Total 12 months.....	1.00½	1.20	.80

The average spot price of No. 1 feed barley for the following years was:

Year.	Price.
1882-83.....	\$1.25½
1883-84.....	.94½
1884-85.....	.97 1-10
1885-86.....	1.23
1886-87.....	1.00½

Charters to U. K. are, in this month, \$2.50 (12½c per ct) per ton less than in July, 1886.

The receipt of oats last crop season was 455,624 cts, against 700,639 cts, the season of 1885-86.

Oats closed dull and heavy, with light trading. New oats will soon put in an appearance.

In rye and buckwheat there is nothing doing, owing to light supplies and no demand.

Corn is easy under liberal supplies and an inactive demand. Crop advices are fairly favorable.

Exports of wheat from India for the week ending June 25th were 1,140,000 bushels, of which 380,000 bushels were to the United Kingdom and 760,000 bushels to the continent. The total shipments from January 1st to June 25th were 16,940,000 bushels, of which 7,940,000 bushels were to the United Kingdom and 9,000,000 bushels to the continent.

Interior advices report that the yield of barley on the lowlands and tules will be large to the acre, and of good quality. In the large barley-producing counties the crop, it is now said, will be less than heretofore claimed.

Quantity of barley on passage to United Kingdom June 9th, reported at 850,000 bushels against 640,000 bushels for corresponding time in 1886.

Quantity of wheat on passage to France June 10th, reported at 3,200,000 bushels against 656,000 bushels for the corresponding week in 1886.

Crops in France are in better condition, though the harvest will be late. Rye is ripening well, but the yield will only be an average.

The area devoted to flaxseed in Berar, India, is reported at 386,376 acres, against 618,224 acres last year, a decrease of 37½ per cent.

The wheat crop in New South Wales is reported at 5,955,000 bushels, against 2,768,000 bushels during the previous year—the largest yield since 1870. The average per acre was 17½ bushels.

It is believed that the acreage under wheat in the United Kingdom this year will show an increase of five per cent over that of the previous year, the increase being largely at the expense of barley and oats.

The highest price ever reached by wheat in Chicago was \$2.85 per bushel, in the year 1867, and the lowest price was 55c per bushel, in 1861.

Feedstuff.

Notwithstanding the receipt of hay in this city was 111,176 tons from July 1, 1886, to July 1, 1887, against 84,612 tons the same time in 1885-86, still prices kept up better than during the latter time, which goes to prove the very large increased consumption. The market to-day is quiet, but strong, with holders not pressing the market, believing in better prices later on.

Owing to several flouring mills temporarily shutting down, the supply of bran and middlings is light, causing a firmer market. Other ground feeds are without change.

Fruits.

Cantaloupes are making quite a show. A few watermelons have come in, but not enough to justify quoting. Grapes are coming in more or less green, and otherwise poor. Choice grapes would find a quick market.

Apricots appear to have touched their lowest figure for the better varieties.

Choice peaches are coming in more freely, but as yet the trade only buys—too high for canners.

Plums are in fair receipt, but the more choice have not put in an appearance, or, at least, none are quoted.

Currants have a wide range, owing to quality. Poor currants are in oversupply.

Blackberries and raspberries are gradually settling under freer receipts. Canners are not taking in yet—too high.

Strawberries are being cleaned up from day to day by canners, at from \$3.50 to \$4 per chest. The trade pay more.

Raisins are in light stock, with the more choice

grades hard to get. This year's crop promises to be larger than that of 1886, and of a much better grade.

Apples are showing to better advantage, but prices do not appreciate, owing to free receipts.

Cherry plums are hard to sell.

Dried fruits continue to come in slowly. More apricots are at hand, and are readily placed at from 12 to 14½c per lb.

Live-Stock.

Heavy sales of beef cattle are reported in different parts of the State, and also in Nevada, and, as a rule, above prices obtainable in this city. Why prices are kept down here is becoming quite a question, but those in position to answer are non-committal. The consumption continues light. Mutton sheep have a firmer tone, owing to the flocks being in the mountain ranges. Calves are in light supply. Hogs are firmer under a growing scarcity. The supply of dairy fed is about exhausted, while the grain fed will not be ready for some weeks. Hogs fed on acorns are very scarce; last year at this time there was a heavy supply, but now there are very few. The market is dull for work horses, but strong with quick sales for roadsters, single-footers, and matched teams.

The following are the wholesale rates to slaughterers to butchers:

BEEF—Extra, 7½c; first grade, grass fed, 6½@7c per lb.; second grade, 6c; third grade, 4½@5½c.

MUTTON—Ewes, 5@5½c; wethers, 6@—c.

LAMB—Spring, 7@8c.

VEAL—Large, 6@7c; small, 6@8c.

PORK—Live hogs, 4½@5c for heavy and medium; hard dressed, 7@7½c per lb; light, 4½@5c; dressed, 7@7½c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Vegetables.

Cabbages are slower, but no lower, as are root vegetables.

Potatoes come in more liberally, but prices keep up, owing to the active demand. The quality shows an improvement over last year.

Onions are steady at full prices. Hard keepers are quickly taken at full figures.

String beans are not of the best, and consequently move off slowly.

Cucumbers, tomatoes, summer-squash, and peppers are mending slowly under free receipts.

Green corn is strong and higher, owing to the first crop being about out of the market.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.....	260,092	306,703
In port, disengaged.....	119,612	33,319
In port, engaged.....	13,222	27,324

Totals..... 392,926 367,346

The above gives a carrying capacity as follows: 1887, 628,781 short tons; 1886, 587,753 short tons; increase over last year, 40,928.

A correspondent wishes to know how to "tell fresh-laid eggs from those slightly off." The shell of a fresh-laid is rough, but the shell of an egg "slightly off," or not fresh-laid, is smooth and feels more or less oily.

Poultry under light receipts have ruled strong and higher throughout the week.

Beans are slower, with a weaker tone, and some concessions made.

Choice fine wools are firm in sympathy with the East, and also Europe, but poorer grades move slowly.

Hops are being more inquired after by local brewers, owing to an increased consumption of beer. Quotations cover the range of the market.

Provisions have a stronger tone, owing to Eastern telegrams reporting a lighter supply of hogs and prices stiffening.

San Francisco, July 6, 1887.

Fruits and Vegetables.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

EXPLANATION.—Cl. for clear; Cy. cloudy; Fr. fair; Fy. foggy; — indicates too small to measure. Temperature, Wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours. Note "T" indicates precipitation inappreciable.

WAKELEE'S

THE BEST
IS THE
CHEAPEST.

SQUIRREL AND GOPHER EXTERMINATOR!
IN 1-LB. AND 5-LB. CANS.

CANADIAN TRADE.—The value of imports in the United States from Canada, and exports to Canada, during 1886, were: Imports, \$37,304,036, and exports, \$48,451,011. In 1884 the imports reached \$38,399,835 and the exports \$49,565,375. During the last year the eggs received from Canada were worth almost as much as the fish. The fish imported were valued at \$2,022,956—\$1,065,416 worth free and \$957,540 worth dutiable. As for exports, a great falling-off occurred in 1886 in the shipment of cattle and a smaller one in hogs. The deficit extended also to the hog products—bacon, hams and pork.

THE CEDAR SPRINGS SAWMILL.—H. D. Barton has purchased the machinery of the Cedar Springs sawmill in Tulare county, and will remove it to Pierce valley and saw the timber of that region. Mr. Barton states that there is a fine body of timber around Pierce valley that has escaped the attention of timberland seekers, and that he intends to have his sawmill in operation there by the 1st of August next.—Tulare Times.

THE ANDERSON FLOURMILL is to have \$7000 worth of new machinery and fixtures added in time for grinding this season's crop of wheat.

NEW ENGRAVING CO.

PHOTO AND WOOD ENGRAVING,
Wax Electrotpe Engraving,
ZINCOGRAPHING, ETC.,

BY THE BEST AND CHEAPEST METHODS.

OUR NEW PHOTOGRAPHOTYPES,

Made Direct from Photographs, for Newspaper, Book and Job Printing,

STAND NEXT TO STEEL PLATE ENGRAVINGS IN FINENESS AND PERFECTION. THEY ARE PRODUCED QUICKER AND CHEAPER THAN ANY OTHER GOOD ENGRAVINGS, THROUGH THE GREATEST INVENTION YET MADE IN PHOTO-ENGRAVING.

Dewey & Co.'s Scientific Press
Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

Dr. J. KOBBS—Dear Sir: I have analyzed your sample
of "Nitrogenous Superphosphate," with the
following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.33 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85
per cent Ammonia, therefore, total of Nitrogen calcu-
lated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vine-
yards, orchards, gardens, farms, and I recommend its
use by the cultivators of the soil generally, in Cali-
fornia. Yours truly, DR. E. A. SCHNEIDER.

University of California, College of Agri-
culture.

BERKELEY, Nov. 20, 1886.

Dr. J. KOBBS, San Francisco—Dear Sir: I take pleas-
ure in adding my testimony to that of Dr. Schneider as
to the high quality of the "Nitrogenous Super-
phosphate" Fertilizer, analyzed by him at your re-
quest. It is a high-grade article, and as such re-
turns the user a better money value than a low-grade

H. M. NEWHALL & CO., Agents, 309 and 311 Sansome St., San Francisco.

fertilizer. It is especially well adapted to use in
California, on account of the predominance in
it of Phosphoric Acid, which is generally in small
supply in our soils. Yet it is desirable that "com-
plete" fertilizers be used in our orchards and vineyards,
and yours is of that character in furnishing
Potash and Nitrogen as well. Very respectfully,
E. W. HILGARD.

The value of this Fertilizer consists in the large per-
centage it contains of Phosphoric Acid—the chief
element of all plant food—in combination with the
necessary quantities of Potash and Ammonia, and
the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found
sufficient: For Wheat, Barley, Corn and Oats, 300 to 350
pounds per acre. For Grass, Sugar Beets and Vege-
tables, 250 to 300 pounds per acre. For Vines, Fruit
Trees, from 1/2 pound to 1 pound each. For Flower Gar-
dens, Lawns, House Plants, etc., a light top dressing,
applied at any time, will be found very beneficial.

HEADQUARTERS FOR ALL KINDS OF BALING PRESSES —AND— HAYING TOOLS.

THE MONARCH. JR.. HAY PRESS.

IMPROVED FOR 1887.

Any young man can earn more on an investment of \$500 in this press than can be earned in expending \$3000 for any other machine. We have a Monarch Press, which we sell for \$600, but has been used a very little and is just as good as new, which we will sell for \$450.

THE CLIMAX HAY PRESS, \$300.

Weight, 2200 lbs. A crew of three men—four can be used to advantage. Five ropes are used on the bales. Capacity, 10 to 15 tons per day. The best press for the money in the world.

The Celebrated Petaluma Baling Press.

Weight, 2600 lbs. Price, \$350, delivered at the factory. Size of bale, 22x22x45 inches. Capacity, 26 tons per day. Weight of bale from 225 to 400 lbs. This remarkable machine still stands at the head of all vertical baling presses, and probably bales three-quarters of all the hay west of the Rocky Mountains.

Whitman's IMPROVED New Rebound Plunger.

GREATLY IMPROVED FOR 1887.

Do not confound our New Press with that made two years since. EVERY PRESS FULLY WARRANTED. For one or two horses. The most powerful in use. The most rapid and durable, and the most perfect. Makes the most perfect bale. The most simple to operate. Least expense for repairs. NO STOPS FOR TYING BALE.

The Greatest Success of the Age.

Victorious in every contest. Doubt-acting, with new concentrating power. Do not buy a Press until you have seen the IMPROVED New Whitman with concentrating power. Puts from 10 to 15 Tons in a Car.

16x18 Mounted, weight, 3600 lbs. \$400 00
16x22 Mounted, weight, 3800 lbs. 450 00
All make bales of variable size.

Hay Forks, Hay Carriers, Harpoon Forks, and all kinds of Haying Tools in great variety. In baling your hay, use our Steel Baling Ties. Cheaper than Wire—Better than Rope.

TRUMAN, ISHAM & HOOKER,

Free Coach to and from the Depot. J. W. BECKER, Proprietor

THE "NEW BECKER." SEVENTH IMPROVEMENT, April 1, 1887.

At Last to "Perfection."

Approaches nearer to the old method of hand-rubbing than any invention yet introduced to the public. EASILY worked, and washes PERFECTLY clean. Owing to its intrinsic merits thousands have been sold all over the United States, and all giving PERFECT satisfaction. It only needs to be seen and tried to be appreciated. Awarded first premiums 1883, 1884, 1885 and 1886. In localities where as yet I have NO agent, I will ship sample Machine and Wringer on 60 days' trial, the party to pay for them at WHOLESALE prices and act as Agent, if found satisfactory. IF NOT, return them. Do not lose money by waiting until some one else orders samples and secures an agency for your locality. Farmers make \$200 to \$500 during the year. Ladies have great success selling this washer. WRITE AT ONCE for New Illustrated and Descriptive Pamphlet, which contains my liberal proposition. Mention this paper. DO NOT DELAY.

E. W. MELVIN, Proprietor and Manufacturer.

HAY PRESSES.

THE HURRICANE,

A Mounted Double-Ender Baling Machine, capable of baling 40 tons per day.

ITS RECORD

For the first year of its existence is as follows: Four tons in one hour, nineteen and three-quarters tons in a half day, thirty-seven and one-quarter tons in one day, and 1800 bales in six successive days.

Two sizes: Compressed bales and common bales. Improved this year so that it is nearly one-quarter faster than before, and the back-and-forth movement of the horse lever is made to bring the hay across the stack and hoist the bales into a pile.

Has three or four times the capacity of Eastern-made presses, with the same number of men and horses.

Price, at factory, San Leandro, Cal., \$1000.

THE JUNIOR MONARCH

Does its own Tramping. Feeds at Side, near the Bottom.

HAS THE FOLLOWING RECORD:

33 tons in one day; 105 tons in 3 1/2 days; 20 tons, and over, daily average for the season; 2350 tons with one press in one season; 23 sold in one valley last season.

Price, at factory, San Leandro, Cal., \$500.

THE

Genuine Price Petaluma, With Latest Improvements.

Made under the supervision of the inventor, JACOB PRICE. Too well known to need further description. First-class material and workmanship. Capacity, from 10 to 18 tons per day. Hay must be tramped in press.

Price, at factory, San Leandro, Cal., \$350.

Send for large illustrated Catalogue of above presses. Office and Factory, SAN LEANDRO, CAL. Address

The Sweet Gum.

Readers of the RURAL who came hence from the Sunny South, and have learned to mean the eucalyptus when they talk of "gum tree," will be pleased to return for a moment to the "gum tree" of their earlier days, which is inexpressibly handsomer than the importations from Australia. Our engraving shows a twig of the highly prized tree of the South. It is from a recent report of Dr. Vasey, United States Botanist, who includes it in his list of native medicinal plants.

The sweet gum is a large tree, native in the United States from Connecticut westward to Illinois, southward to Florida and Texas, thence into Central and Southern Mexico. It belongs to the witch-hazel family (*Hamamelaceæ*). It grows from 80 to 150 feet high, reaching its greatest development in bottom-lands of the Lower Mississippi. Its symmetrical, compact form and bright, glossy, star-shaped leaves make it one of the most beautiful trees of the forest. The flowers are of two kinds, the male and female being in distinct clusters; the male flowers are in a raceme of small, globular clusters at the end of the twigs, having very many stamens intermixed with small scales. The female flowers are situated below the male ones; they are inconspicuous at first, but gradually enlarge into a round head or cluster of two-celled ovaries, each with two beak-like points, the whole when mature forming a globular, spiny ball of about an inch diameter, shown in the engraving. The leaves are from three to six inches in diameter, rounded in outline, and divided into from three to seven, usually about five, pointed lobes. They are smooth and shining, finely serrated on the margins, and fragrant when bruised. In the warm portions of the country and in Mexico a balsamic juice flows from the tree, which has medical properties. The United States Dispensatory states that this juice "is a liquid of the consistence of thin honey, more or less transparent, of a yellowish color, of a peculiar, agreeable balsamic odor, and a bitter, warm and acrid taste. It concretes by time, assuming a darker color. It is sometimes collected in the form of tears, produced by the spontaneous concretion of the exuded juice." This resinous gum has properties very similar to that of the true storax which is yielded by an allied species of *Liquidambar* growing in Asia Minor. The gum of our native tree has been collected to a considerable extent for the preparation of chewing-gum; it has also been medicinally employed for the same purpose as storax, in the treatment of catarrhal affections and of pulmonary complaints.

LOS ANGELES POMOLOGISTS.—The meeting of the Los Angeles County Pomological Society held last week at Orange must have been an occasion of much interest. Essays were read by Milton Thomas and D. Edson Smith, and a poem by the horticultural poet laureate, A. V. Kercheval. Mr. Coquillet made an address on fruit pests. We expect to refer to these matters hereafter. Milton Thomas reported a plan for holding a fair in Los Angeles from Sept. 12th to the 19th, and then send all the good portions of the exhibit to the Grand Army exhibition at St. Louis. The plan was adopted and the Executive Committee was instructed to carry it out. A Working Committee was appointed to collect the exhibits.

CONDENSED MUST.—J. De Barth Shorb of Los Angeles states that the movement looking toward the manufacture of condensed grape must for exportation is progressing. Two machines are being made in this city according to Dr. Spruegmuhl's plans. They will each cost about \$25,000. The copper for the vacuum pans, the essential part of the apparatus, arrived recently, and the work is going forward rapidly. The contract calls for the com-

London. Mr. Shorb says he believes the company can guarantee that generally an increased price will be paid for the grape products. He says he told a Fresno man, who last year sold his grapes for \$9 a ton, that for that quality of grapes they could afford to pay \$15.

GRAIN BAGS MAY RETURN FREE.—In a circular to customs officers, Assistant Secretary of the Treasury Maynard says: Grain bags man-

THE SWEET GUM OF THE SOUTH—*Liquidambar styraciflua*.

pletion of one of the machines by September 20th and the other as soon thereafter during the vintage as possible. One of the machines will go south, and one will remain in one of the northern vineyard districts. Each machine has several parts—a grape-crusher, an apparatus to extract the seeds and another to press the skins. The skins are pressed and shipped with the must. Each of these machines will have a capacity for disposing of about 80 tons of grapes a day. The process of condensing is a quick one. In about four hours from the time the grapes from the vineyard are put into the machine the condensed must will be ready for shipment. It will be shipped in barrels or casks direct to

factured in the U. S., when exported filled with American products, may be returned to the U. S. free of duty, notwithstanding that such bags were manufactured from foreign materials. This decision will be applied to all future importations of returned grain bags and other coverings of exported merchandise which may be of the manufacture of the United States.

THE California Kennel Club has decided to hold a bench-show in this city some time next month. Over 200 dogs are already booked, and will probably be exhibited in Odd Fellows' hall.

COLTON has elected to incorporate as a city of the sixth class. The vote, which was taken on the 11th, stood 116 to 57.

Forestry.

It is announced that a meeting of the State Board of Forestry will probably soon be held to consider the important measures which the Board has now in progress or in contemplation, and to decide upon a line of work for the coming season. Some months ago an importation of Australian tree-seeds, chiefly Eucalyptus, was distributed in the southern part of the State, and probably reports of growths secured for planting-out will be made. It is contemplated to establish a forestry experiment station in the neighborhood of Santa Monica, Los Angeles county. Naturally, the Board would look first to the extreme south of the State because of the lack of forest in that district.

It is announced that if funds are sufficient another station will be established in the upper part of the State. It is reported that the work of the Commission in stopping timber-cutting on school lands has been quite effective. Other depredations are, however, of more or less frequent occurrence, particularly the burning of large tracts of timber by criminal carelessness of campers and others. This is the main reason for the organization of a forest guard. As far as the funds of the Commission will allow, parties will be paid for performing this duty; but in order to make it still more effective, the services of volunteers will be asked for, and to this call there should be responses from all persons residing in the timbered portions of the State.

It seems after all that no Arbor Day has been established for California. The Legislature passed the bill fixing Washington's Birthday as Arbor Day, but the Governor failed to approve it. The bill may have been attended by provisions which he did not favor, but we cannot see what objection there can be to enrolling California among the many progressive States which are increasing their arboreal resources very fast by the general interest which the people take in Arbor Day celebrations. We trust the matter will certainly prevail at the next Legislature.

STATISTICS OF THE GRAPE CROP.—Clarence J. Wetmore, secretary of the Viticultural Commission, is sending out circulars calling for reports from vine-growers on the condition and prospects of the grape and wine product for the coming vintage. Information is asked concerning injury from frost and various vine diseases; the aggregate grape crop this year as compared with last, the special varieties which yield well and those which do not; general remarks concerning matters of importance in the district. Any grape-growers' help in this matter will no doubt be welcomed, and blanks for reports will be furnished on application to Mr. Wetmore, at 204 Montgomery St., S. F. We hope the reports will be full and wide-reaching and promptly made, for correct statistics on this subject are of great importance.

CALIFORNIA FRUIT-GROWERS.—B. M. Lelong, secretary of the State Board of Horticulture, estimates that there are at present 12,000 orchard-owners in California, and that during the past five years their ranks have been recruited at the rate of 1000 per year. This includes, of course, new-comers who have planted orchards and the many who have been won from grain or stock farming to devote part of their land to the growth of fruit.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

In the Santa Paula Country, Ventura County.

EDITORS PRESS:—In our descent of the Santa Clara valley of the south, on leaving that portion heretofore mentioned as the Valley of the Sespe, we enter the Santa Paula country, at the distance of about 18 miles from the coast. The country here intended to be specially mentioned extends down the Santa Clara some six miles to the termination of the mountains on the south side of the valley, only some four miles above the village of Saticoy. This section includes the narrow valley of the Santa Paula river, which enters the Santa Clara valley about two miles below our starting-point, and extends in its ascent several miles northwardly and in the direction of the Ojai valley.

Healthfulness being one of the greatest of considerations in our determination of the desirableness of a country for a place of residence, we notice that this Santa Paula section may be considered as division ground between the frequently recurring fogs of the coast and the drier atmosphere of the valleys above. Within the immediate influence of the fogs the climate may be considered healthful except for persons afflicted with lung or throat diseases, or rheumatic affections; but, owing to the great humidity of the atmosphere, persons coming within these exceptions would be far better off living in the Upper Santa Clara valley or some of its tributaries, where the altitudes are greater and where the fogs do not usually penetrate. At times considerable winds prevail in the Santa Clara valley, but unless accompanied by fogs their influence is not considered detrimental to health.

The Town of Santa Paula

Is situated near the confluence of the Santa Paula and Santa Clara rivers, 16 miles east of San Buenaventura, is a trading post, has a depot on the S. P. R. R. Coast Extension, publishes a newspaper, and has several good business establishments. Being in the midst of a fine agricultural region, this place bids fair to become a desirable location for business, and since the building of the railroad to this point, and now on further, it is rapidly increasing in population and importance. The inhabitants are supplied with an abundance of good water, taken from Santa Paula river, several miles above. We notice the fine, commodious schoolhouse here, which speaks a volume for the intelligence and enterprise of the country.

Neighboring Farms.

Within the boundaries of this section are many flourishing ranches, exhibiting a high state of cultivation, with much the same capabilities as to production of live-stock and range as to varieties of crops as those enjoyed by the upper portions of the valley. Both the climate and food seem extremely well adapted to the raising of fine horses and cattle, and we intend, in a separate chapter, to notice the fine stock ranch of W. L. Hardison, one mile north of Santa Paula.

Wheat, barley, beans and corn are the staple field crops. Great quantities of barley hay are raised in all this valley. The lima bean is planted extensively. Persons just from the East, for the first time, on visiting this country, might be curiously struck with the fact of being able to raise a large crop of lima beans without a stick or pole to run them on; but people who pass one summer in our atmosphere will witness the dry surface of the soil, and need no further enlightenment on this subject. Enough moisture is retained in the ground to raise field crops, such as above mentioned, to perfection, and yet the surface remains so dry that no uneasiness exists with reference to mold or decay of beans or other crop running on the ground. Early and thorough plowing is an indispensable prerequisite to the raising of such crops. By the means of frequently breaking the surface of the ground in the early part of the season, when the same will not interfere with growth or the running of the vine, sufficient moisture is retained to secure the crop. Both Irish and sweet potatoes of first-rate quality are, on good authority, reported to be grown here, and so may properly be included among the important field crops of the country.

The Soils.

The soil of the Santa Clara valley here changes from the sandy formation of the upper valley to what Prof. Hilgard describes as a "dark-gray silty loam of great depth and remarkable for its retention of moisture near the surface." This is descriptive of the soil of the lower portions of the valley in the Santa Paula region and on down to the coast. In describing the valley soil taken from Mr. N. B. Blanchard's orange orchard near Santa Paula, Professor Hilgard remarks: "The color of this soil is a light amber, and when wet blackish and silty, very easily tilled, and retaining its tilth remarkably, so that the hand can easily work its way up to the elbow, and an ax-handle can be thrust down to the head with little exertion. The material remains apparently the same for from 12 to 20 feet in the lower bench of the valley where this sample was taken. Toward the hills there is a second bench, where the soil is apparently the same, but of a slightly reddish tint. On the mountain slopes the soil, still quite similar in its working qualities, is of a decidedly reddish tint, and is remarkable for its retention of natural moisture,

enabling it to produce corn without irrigation."

The orange orchard of N. B. Blanchard, mentioned by Prof. Hilgard as above, is by far the largest orange orchard in the county. We called to see the place and take notes of its history, but unfortunately Mr. Blanchard was away from home, having gone to Los Angeles, and no one present who could give us any important information. We understand from others that there are here about 100 acres in orange trees. The orchard appeared to be kept clean and the trees, as far as our observation extended, in good bearing condition. We saw none of the fruit, as it appeared to have all been picked. We were not over the orchard, but, under the circumstances, contented ourselves with driving along the road at the side.

In what is called the Santa Paula canyon, (the same being the Santa Paula valley before mentioned), one mile north of the town of Santa Paula, H. Crumrine has 500 orange trees 11 years old, principally seedlings, with a few of the Navel, Mediterranean Sweet, and Eureka varieties, remarkably clean limbed and free from disease, having neither smut nor scale. The trees are in fine bearing, and the fruit of good size and excellent flavor. He has about 30 lemon trees of Eureka, Lisbon, and Sicily varieties, all doing well. He has also a hedge of lime trees bearing excellent fruit. The condition of the trees and fruit of this orchard speaks well for what may be done in the way of raising fruits of the citrus family in this neighborhood.

The soil in Mr. Crumrine's orchard is for the first three or four feet in depth gravelly, having been washed from the hills on the west side of the valley. Under this, Mr. Crumrine reports a deep, rich loam from 8 to 25 feet in depth.

Deciduous Fruits.

As a representative place we will notice the very attractive orchard of J. F. Cummings, four miles below Santa Paula. Mr. Cummings has many kinds and varieties of fruit. We note the Eastern black walnut, now about eight years old, and which bore at seven, and now in the second year of its bearing. The English walnut is regarded as the best tree for profit that can be planted in this valley. Mr. C. is this spring planting 40 acres of this valuable nut-bearing tree. Of soft-shells there are now a number bearing, but the trees are not thrifty. This variety of the walnut at this place is condemned as liable to grow long-limbed on one side, high up, which unbalances and throws the tree substance into unsightly and disproportioned shapes and to the great injury of the balance of the tree.

The apricot is a great grower and bearer. The tree seems to love the salty atmosphere coming up from the ocean and leans in that direction, its strongest limbs reaching out even against the winds that during the day blow up the valley. All other trees lean in the opposite direction. Of varieties the Large Early bears almost every year, and is considered the most desirable for all purposes. The Moorpark is here, as in most places in the State, a shy bearer.

Of other fruits the peach is considered generally a good bearer. Apples do fairly. The Yellow Bellflower, Yellow Newtown Pippin, Early Harvest, Red Gum and White Winter Pearmain are considered the best for this place. Of plums he has a blue seedling, which is a fine bearer, but no other plums do well. We understand that plums and prunes do fairly in some places. Cherries here, as in most places in the county, are a failure. The loquat is considered an important fruit, bears every year, coming in at the last of April and first of May when much needed. The Japan persimmon bears heavily every year. The fig all over this region promises a good success. Almonds budded, do not, at this place do well. Some seedlings in the neighborhood bear well, which indicates the direction that experiment might well afford to take.

On Mr. Cummings' place oranges are a fine success, and ripe from January to July. The Washington Navel, Mediterranean Sweet, and some others are generally of large size, and, in the matter of taste, the Mediterranean Sweet is excellent. It is at this place seedless. The Washington Navel is not so sweet.

Mr. Cummings has land that has yielded 25 sacks of 100 pounds each per acre, and of the finest quality. His acreage of beans has been as high as 2150 pounds.

The eucalyptus seems to be at home in this valley, and on this place we see some remarkably fine specimens ten years old and two feet in diameter.

Some two miles below Santa Paula we find the banana blooming and fruiting to perfection in open grounds. In all this country we notice the extraordinary developments of various palms, and of flowering shrubs and plants, affording to visitors a constant source of delight, and by their charming influences, enhancing the value of households.

McD.

Uses of the Water Barrel.

EDITORS PRESS:—The fire of fuses and the pop and crack of crackers and bombs has already commenced here in our beautiful city, to let us know that the day of days to boys is near at hand, and Fourth-of-July accidents, runaways and conflagrations will soon have come and departed. Most conflagrations at birth are small, and could be easily quenched if water could be promptly applied. We keep at our house what we call "The Truth Barrel," for though a receptacle for lye, yet its great

economy and usefulness is a self-evident truth. It is located midway between the backdoor and the pump, and is set into the ground six or eight inches. Morning-glories, Maderia vines and a hopvine grow around and over it, and vie with each other for the beauty prize. I think the morning-glories will get the prize for beauty, but the homely, leaky old barrel and the luxuriant hopvine that utilizes the rich plant-food that leaks from the barrel will win the prize for usefulness.

The uses of hops need no recital. The barrel furnishes means to rapidly dip and throw many buckets of water without stopping to pump. In case of fire this alone may be worth many hundred dollars. One or more buckets of wood-ashes are kept in the barrel. This breaks or softens the water so that it is almost as good as rain-water for washing and bathing. After using the hard well-water awhile, it is a treat to take a bath in this soft water from "The Truth Barrel."

Again, pumping the water at odd moments, to fill the barrel is much easier, and makes "wash-day" much pleasanter than to do all the pumping on "Blue Monday." The investment is so small one can afford to pour in an extra bucket of water after the barrel is full, thus running it over and carrying off lots of bits of charcoal and other floating matter, not wanted in the water, but useful to the surrounding vines. I think many delicate plants do better when watered from this barrel; the water being softer and warmer seems to agree with them.

C. A. WYMAN.

San Jose, Cal.

THE FIELD.

Agriculture and Chemistry.

F. H. Storer, Professor of Agricultural Chemistry in Harvard University, has just written, and C. Scribner's Sons have published, a most excellent treatise in two volumes entitled "Agriculture in Some of its Relations with Chemistry." This work, the fruit of many years' public instruction in Harvard University, is in no way a technical treatise, nor does it make any special appeal to chemists and students of chemistry. It is agriculture rather than chemistry that forms the subject of the book, and it is the general and universal phases of the subject that are treated rather than any particular operations of the agriculturist. The work was prepared in the interest of persons fond of rural affairs, and of students of agriculture. It is the final form in which have been cast the results of long study, observation and experience, both practical and in the classroom. The style is clear and straightforward, and the discussion throughout is open to the comprehension of any intelligent reader. As an authoritative treatise the work cannot fail to take the highest rank, and although it is intended mainly for those who are specially interested in some form of agricultural industry, the general reader will find much that is of extraordinary interest in the domain of natural science.

The work is comprehensive in scope and exhaustive in its treatment of a great variety of subjects. Professor Storer discusses agriculture in all those important relations into which chemistry enters in any degree—the general relations of soil and air, the atmosphere as a source of plant-food, the relations of water to the soil, movements of water in the soil, tillage, implements and operations of tillage; in short, Professor Storer describes the relations of soil, air, and water to the plant and to each other, tillage, manures and fertilizers, rotation of crops, irrigation, the growth of crops, and staple crops.

We have no doubt that many of our readers who desire knowledge of the principles underlying agricultural practice, and of the latest achievements in the domain of agricultural science, will find Prof. Storer's treatise very valuable. One of our readers in this city who has it, and evidently is reading it carefully, sends us a copy of some paragraphs which attract his attention. He writes as follows:

I beg to hand you an excerpt from a recent work on Agriculture, by Professor Storer of Harvard University with reference to the cost of wheat crops from good land and poor land which at this season of the year may prove useful to the Agriculturist, although the result of the computations, which were originally applied to farming in France, may not correspond with the cost of production in California.

I quote as follows:

Starting with a five-acre field, the idea is to manure the land in such a way that the wheat crop (when its turn comes in rotation) shall absorb 26,400 lbs of manure from one-half of the field, and 44,000 lbs from the other half. It is admitted that every 10 lbs of manure absorbed stands for a yield of 1 lb of wheat, so that the manure upon the lightly manured half of the field will give a crop of 2640 lbs, or say 42 bushels of wheat; while that upon the half which was more heavily manured will give a yield of 4400 lbs, or over 70 bushels of wheat.

Admitting, furthermore, for the sake of argument, that the manure costs a little more than 7½ cents per 100 lbs, the 2640 lbs of wheat (due to the 26,400 lbs of manure) will have cost \$19.20 on account of manure, and in the same sense the 4400 lbs of wheat (due to the 44,000 lbs of manure) will have cost \$32.

The other items to be taken into account, such as labor, seed, ground rent and interest on the capital employed, the sum of which added to the cost of the manure will raise to \$1.40 the cost of each bushel of wheat harvested on the lightly manured half of the field, while the cost of each bushel harvested on the richly manured land will be \$1.25.

Reckoning the straw at \$3.60 per ton and that

there are 132 lbs of straw for each bushel of wheat, the cost of the bushel of wheat will be reduced to \$1.16 and \$1 respectively.

Finally, if the wheat is sold at \$1.20 per bushel and the straw at \$3.60 per ton, the profit on that half of the field which was lightly manured will be \$1.80 and the profit from the other half which was well manured will be \$16.40.

[We would like to have these points discussed by our wheat-growers.—EDS. PRESS.]

THE STABLE.

Treatment of Mares in Foal.

Samuel Gamble of the Cook Farm in Contra Costa county has a valuable article in the *Breeder and Sportsman*, which we reproduce as follows:

When you have decided to breed your mare you have let up on her work. It will be better to cool her out well before breeding her, by turning her out to grass, and take away all her grain before she is bred. There is a wonderful difference in opinion. Some believe in keeping a mare at speedy work. Some mares will get upset if kept at too hard a strain at work and refuse to feed, lose their condition, and cannot be depended on for their usual exertions. At all events, it is found in practice that though the majority of maiden mares will become stunted while at work, yet that a large number require a run out to grass before they will become in foal. There are many mares which their owners desire to work on for some months after being bred and wish to avoid the expense of keeping from the spring when bred to the horse to the next spring. I believe all mares are better for slow work up to within two months of foaling, but they should not be ridden or driven so fast as to occasion exhaustion. Farm or truck mares are generally used to within a few days of their time. You must see that the work is gradually let up on your mare, and avoid straining her. If her legs keep sound, a mare may be made to earn her keep for nine months.

The time of sending your mare to the horse will vary for the purposes for which her produce is intended. If for racing, it is desired that she will foal as soon as possible after the 1st of January, and as she carries her foal about 11 months, the first time of her being in use, after the 1st of February, is the period chosen for her. All racing colts take their ages from the 1st of January, and other classes from the 1st of May; and as about March 1st is the time when the young grass begins to be forward enough for the use of the mare, the breeder is not anxious to have his foals dropped much before March 1st. As mares are very uncertain animals, he will do well to take advantage of the first opportunity after March, as by putting off the visit to the horse, you may be disappointed altogether, or the foal may be dropped so late that the grass is all gone. All valuable brood mares are often sent to foal at the place where the sire stands, who is intended to be used next time. The traveling the foal too soon after foaling would be injurious to both dam and her foal, and hence the precaution I have named is adopted. The mare then remains to be tried at interval days, some in nine days and others in seven, and others in 14 days, and others in 18 days. Mares are not the same. By the time your mare is stunted, the foal is strong enough to stand a journey of about 15 miles a day, which is quite as much as a nine-days-old foal can travel to a horse without injury, and that done very quietly, the mare being led at a slow walk all the way.

When the mare is in foal, if not intended to be kept at work she should be turned out in good pasture, but it should not be so rich and succulent as to disagree with her stomach or make her unweildy from fat. This mistake is a constant cause of miscarriage, the bowels becoming relaxed from the improper nature of the grass, and sometimes the mare will become thin and starve her foal in its growth. Mares that have been grain fed highly all their lives should have, if possible, one or two feeds daily of ground oats or barley with bran and a few carrots, after they are six months gone, and a free use of their paddocks. Excessive fat is a state of disease, and interferes with the due nutrition of the foetus, while it is very dangerous in foaling time, when it not only interferes with the process, but also produces fever. Supposing yours is at work, she should have some kind of green food, any kind of green grasses, or, after the grass is gone, carrots are fine sliced in a bran mash every night. By adopting this food the mare is kept free from inflammation, and yet the foal is well nourished. Excitement of every kind should be avoided if possible.

Slipping the foal is sometimes caused by the smell of blood or excitement, and my experience teaches me that one mare miscarrying will sometimes affect others. If a mare has "slipped" a foal in a previous pregnancy, double care should be taken, as she will be far more likely to do so again. When it happens about the fourth to sixth months gone, care should be taken at that time. It is better to keep her by herself, in a small paddock, where she will get exercise. Physic or purging should not be given unless it is really necessary. If the bowels are so confined as to require some stimulus of this kind, and if bran mash or other changes in the food fail to produce any effect, choice should be made of the mildest aperient which is likely to answer the purpose.

With regard to the management of the mare in parturition, I shall leave its consideration to my readers, and to some of them, who will agree with me, my advice is, if they should have a case of this kind and assistance is needed, it is safer to have recourse at once to a properly educated veterinary surgeon. Stud grooms who have had much experience will sometimes be able to aid Nature with advantage, but in the long run will probably do more harm than good if they attempt any serious interference.

Treatment after foaling in a healthy state, the mare very soon recovers from the efforts she has made in bringing forth the foal, and in fine weather she may be allowed to enter the field the fourth day, which is soon enough to suit the strength of the foal, though the young foal is very active within a few hours after it is born. Until the foal is strong and straight on its limbs, it is better, in my opinion, to keep it from running too much. Until the mare can get plenty of grass, she should have carrots and a mash of ground oats, with bran, which should be made at first in the shape of gruel. The water in which this is made should have the chill taken off. The proper time of putting the mare to the horse your readers all know; with me, I prefer the ninth day.

During the remainder of the time of suckling no special treatment is required, except to see that the mare gets well fed and protected from bad weather. At weaning time she sometimes requires a dose or two of cooling medicine, but generally she is so nearly dry that no interference is required. If the young foal is well formed and healthy it will require no attention beyond that which I said is necessary for the dam. Those accidents which are liable to happen, such as rupture either in the navel or flank, abscess in the hernia, or inversion of the feet, etc., can all be treated in the proper time and places. In some cases about the time of the mare being "in use" the foal is generally purged a good deal, and a warm drench will often be required.

At three months or so the foal will eat a little ground oats, which is required for all highly bred young stock if you require to race them young. All work-horse colts would be better for this. But if it is begun it should be continued. But unless the foal is bred and shows such promise that it is expected to turn out well, the extra expense will not be reimbursed. Now, between a trotting bred or a thoroughbred for racing purposes fed a little grain, and one confined to hay, the difference in value would be 1000 per cent, but among inferior bred horses, on the average, it would scarcely pay.

Shelter from the bad weather should, however, be afforded to colts of all classes during the winter season, and unless they have this they soon grow out of form and lose flesh however well they are fed. A colt neglected in the winter never recovers its proper shape, nor does it grow into the size and strength of body and limbs which naturally appertain to its breed. Therefore, the cruelty of exposing the young colt to a climate for which it is not fitted does not pay, and on the latter account, if not on the former, even the most heartless who consider their own interests will make suitable arrangement for protecting their young colts from the bad winter climate. The colt should be handled from the very first week of its life, but there is no occasion to use it roughly. The pressure of the hand on all parts of its body and limbs, and in a short time the foal will allow its feet to be picked up and its head and ears to be rubbed without taking offense.

Grooms are sometimes in the habit of showing off their powers in this way by taking the foals up in their arms. But this can do no good, for it may do some injury to the walls of the abdomen. About the fourth month during weaning a light halter should be put on, and after the colt is accustomed to its pressure by repeatedly handling, in a few days a leading rein may be put on and the colt enticed to follow. At the same time it must be made to feel that resistance is useless, and if it begins to pull it must on no account be allowed to get away. By no means pull straight back on him, but coerce him gently. With a side strain and carefully handling the colt will rarely give any trouble in this way. But there are variations in the power which different men have over the animal creation; some will control without using the slightest violence, while others will be always fighting with the colt. This class should never be allowed to have anything to do with the baby colt. Yet, if a man is found resorting to violence with a young foal, he should be removed or he should be carefully watched, and if he repeats his offense you ought to say to him, "Here, you take a long walk from here; you are getting too fat," etc.

The usual age for weaning the foal is about the end of the fifth, or five and a half months, because the dam is generally about half gone with her next foal and cannot bear the double drain upon her system; nor does the foal benefit much by the milk after this age, the teeth and stomach being quite strong enough to crop and digest its food. For a youngster like this, if the fall is dry and no green feed, a few steamed turnips or carrots should be mixed with bran and given to foal night and morning. Two foals placed together in the same stall or paddock for company miss their mothers sooner than when confined by themselves. Care should be taken that nothing is left within their reach which can do injury, every fence being carefully examined so that no nails or rails are likely to get to their bodies or limbs as they gallop and play about. Foals of all ages are mischievous and are inclined to lay hold of anything which

attracts their notice. Besides the shelter which I have insisted on, the foal requires throughout the first winter good feeding proportioned to its breeding and the purposes for which it is intended. Let the breeder bear in mind that a check given to the growth in the first winter is never afterward entirely recovered, and that if the colt which has experienced it turns out well, he would have been still better without it.

THE VETERINARIAN.

Instinct and Intelligence.

EDITORS PRESS:—It is impossible to draw sharp lines of demarkation in nature. Thinking men cannot say where instinct ceases and reason commences. It is just as difficult to state where the animal kingdom leaves off and the vegetable begins, and in our courts of justice and medical jurisprudence they find it very hard to say where insanity comes in.

There are actions and habits in many of the lower forms of animal life which evince intelligence. In Sir John Lubbock's treatise on ants he says that "a stranger ant, introduced into a nest, although of the same species, is at once recognized as a foreigner, and is usually maltreated or at once put to death." Further experiments went to show that chloroformed ants were at once removed to the edge of the parade board and thrown over—in fact treated as if they were dead and removed from the living accordingly; while intoxicated ants were generally carried into the nest if they were ants connected with that community; if not, they were thrown overboard. These little animals undoubtedly have certain means of communication, as the following indicates: Mr. Belts says: "I next covered an ant with a piece of clay; several others passed it. One of them tried to pull away the clay, but was unable to do so. It immediately set off at a great rate, and I thought it had deserted its companion, but it had only gone for assistance, for in a short time about a dozen ants came hurrying up, evidently fully informed of the circumstances of the case, for they made directly for their imprisoned comrade and soon set him free."

I omitted to state that Sir John Lubbock's idea in making an ant intoxicated by a moderate amount of chloroform was to ascertain whether they had any password by which they were able to distinguish strangers—thinking that in this condition of intoxication they would be unable to remember it. But the sequel proved that there must be some other means of recognition. They at first appear much puzzled at finding their fellow-creatures in this condition, take them and carry them about for a time in a somewhat aimless manner. (Of course all these matters are well known to the readers of the RURAL, and my apology for repeating them is to lead up to the subject.) Their method of making slaves of aphides is interesting.

Mr. Darwin says the brain of an ant is one of the most marvelous bits of matter in the world. The brain is proportionally larger than that of any other insect. Injury to this organ causes, as in the higher animals, tetanic spasms and involuntary reflex movements, followed by stupefaction. In the case of slight injury to brain by other ants, it has caused the most remarkable phenomena. Many of the wounded were seized with mad rage and flung themselves at every one that came in their way, whether friend or foe. Others assumed an appearance of indifference and walked serenely about in the midst of fighting.

A writer to *Nature*, some years back, gave an anecdote showing clearly that birds are at times vindictive: "One day the cat and the parrot had a quarrel—I think the cat had upset Polly's food, or something of that sort; however, they seemed all right again. An hour or so afterward, Polly, standing on the edge of the table, called out in a tone of extreme affection: 'Puss, puss! come now, come now, pussy!' Pussy went and looked up, innocently enough, when Polly with her beak seized a basin of milk standing by and tipped the basin and its contents over the cat, then chucked diabolically. Of course it broke the basin and half drowned the cat."

As an instance of education in birds may be mentioned the tame condition of the sparrows in the parks of this city. I have frequently noticed dogs of my own dreaming, barking slightly in their sleep; and ferrets have often been noticed going through the performance of catching rabbits—i. e., in a modified manner—during sleep, making slight thrusts with their mouths, etc. Mr. Darwin states that an elephant was being fed through the bars of his cage, with potatoes. One falling and being just out of reach of his trunk, he blew it against the wall nearly opposite, and on its rebounding he was able to get it. Surely this was more than instinct!

Instances of the manifestation of something more than instinct in dogs occur so frequently as to render their description almost unnecessary and to some people monotonous. "Monkeys, Apes and Baboons—Notwithstanding these animals differ much from dogs in not having been mentally improved, there is enough evidence to show that their mental life is of a distinctly different type from that of any of those we have previously considered, and that in their psychology, as in their anatomy, they approach most nearly to man." So writes G. J. Romanes.

James Forbes, F. R. S., in his *Oriental Memoirs*: "One of a shooting party, under a banyan tree, killed a female monkey and carried it to his tent, which was soon surrounded by 40 or 50 of the tribe, who made a great noise and seemed disposed to attack their aggressor. They retreated when he presented his fowling-piece, the dreadful effect of which they had witnessed and appeared perfectly to understand. The head of the troop, however, stood his ground, chattering furiously. The sportsman, who felt, perhaps, some little degree of compunction for having killed one of the family, did not like to fire at the creature, and nothing short of firing would suffice to drive him off. At length the animal came to the door of the hut, and, finding threats of no avail, began a lamentable moaning, and by the most expressive gestures seemed to beg for the dead body. It was given him. He took it up sorrowfully in his arms and bore it away to his expecting companions. They who were witnesses of this extraordinary scene resolved never again to fire at one of the monkey race."

G. J. Romanes, at the end of a work upon these matters, says: "In my next book I shall hope to show how, from so high a starting-point, the psychology of the monkey has passed into that of the man." Mr. Huxley writes, speaking of man's early condition: "At the same time, the increasing rudeness of his implements, as we go back, undoubtedly indicates that we have made some approach toward the period when he first emerged from the purely brute state and became a tool-using animal."

To many it may appear that there is a greater difference between man and monkey than between day and night. Yet on comparing the highest type of man with the Hottentots, who live at the Cape of Good Hope, they will with difficulty convince themselves that both are of the same origin. It being absolutely impossible to destroy anything, and knowing as we do that it is by virtue of some peculiar force that we live, is it reasonable to think that this element will cease to exist? As is said by one of Humboldt's biographers: "The highest mortal can only be explained as the product of a more than mortal Power." ROBERT J. DAWSON, V. S.

225 Geary St., S. F.

FLORICULTURE.

Planting Gardens for Effect.

[Written for the RURAL PRESS by GARDENER.]

I shall not attempt, under this head, to take up the subject of ribbon planting, as this demands constant work and much skill, and should not be attempted where a regular gardener is not kept, unless one can give his whole time and careful attention to keeping such a garden in order.

Fine effects may be produced merely with the common plants usually grown by any one with good taste and an eye for color, without, necessarily, a large amount of labor being involved.

As a rule, instead of being first carefully laid out and then arranged with an eye to future effect, the every-day gardener is made piecemeal, regardless of a general plan, plants being stuck in where it is "handy," and flower-beds being made one at a time, to accommodate the new plants as they come. As a consequence, instead of being as beautiful as possible, it is a conglomeration of plants, merely, and often with the most distressing and startling combinations of color. Indeed, many who in other things have good taste will say, "Why, you can put any colors together in flowers, you know," and following this rule, they plant orange-scarlet against intense pink or crimson, and crimson against rose color, with happy disregard of all ordinary rules by which they are governed in other matters.

If one would have a garden-plot prettily arranged, it must be, like anything else to be well done, taken in the beginning. I have in my mind now, two gardens where the two methods were practiced. In one, the owner sat down, got his plan on paper, and arranged for his flowers as he did for his fruit trees. In the other, the plants were "stuck in" on the installment plan, and the result—well, they have a plenty of flowers—I suppose that is the chief end of a garden.

Do not put in anything with the idea of afterward pulling it up and replacing. Take my word for it, you will never have the heart to pull up a large, well-grown bush and put one of meager size in its place; you will be much more likely to hunt up some other spot for the little one and let the large one remain "till things get grown a little," which usually means "indefinitely postponed."

For the best effect you want masses of color, and, as a rule, the more distant the mass the more brilliant the color should be, unless it is white.

Try to arrange your colors so that one shall not "kill" the other, and if you have two striking or discordant tints, separate them by the length of the yard, or at least by a mass of white or green, combinations which, fortunately, may always be used.

Another point is to get as many ever-blooming plants as possible, that your yard may not be barren of flowers a good part of the year; and where you have shrubs or plants which bloom at one season only, to so arrange them as to make the best showing.

By planting your pink flowering Weigelia,

double and single white bridal wreath, and purple and white lilacs in a clump, surrounded by a wide stretch of pink and white daisies, you will have a bed which will be a mass of bloom for weeks in the spring. If you arrange near that another bed of summer-blooming plants and another (of chrysanthemums, for instance) which blooms during the fall, you may have that side of your garden constantly in blossom, not scattering; but in an effective manner.

If we could select just the plants we most admire and fill our garden with them, the task would be an easy one, but, unfortunately, some bloom in the early spring and some not till late summer or fall, and while as individuals they are fine, they will not do to plant together where effect is looked for.

Another thing is to plant your tallest growing plants in the back and the lower ones toward the front. Tall plants hide the low-growing ones and the effect is not so good.

There are many large flowers like dahlias, poppies, hollyhocks, etc., which show brilliantly at a short distance and set off by a backing of foliage are most beautiful. There are so many shades of color among the dahlias, and they bloom so long a time, that it is a matter of wonder to me that they are not seen oftener in our gardens. Double poppies, too, are very beautiful and showy, and a group of them make a blaze of color which is very attractive. Right here I would put in a plea for the double hollyhock, too; while as a mass, the stately spikes of bloom are the loveliest possible for distant effects, the individual bloom is equal to the loveliest rose in shade, texture and shape. I have seen those of a delicate pink tint which I thought, with their satiny petals, equal to any hothouse flower I ever saw, and I have seen a whole company of young folks eager to know the name of the lovely pale straw-colored ones worn by a young lady in her hair.

The gladiolus is another plant which makes a gaudy and beautiful showing. These come into bloom just about the time the roses are resting from their spring blossoming, and it is a good plan to plant clumps of them between your rose-bushes. Their range of color is almost endless, and a choice collection of gladiolus will alone make a garden brilliant for many weeks.

Blue, while one of the most effective colors for a garden, is the most seldom seen, especially in free-blooming plants. Indeed, until we stop to think of it, we do not realize how few flowers there are of a real true blue. However, there are some plants of that color which bloom freely and a long time. Among these is the bachelor's button, which grows nearly as large as a marguerite, though an annual, and is covered with the deepest blue blooms. This is the prettiest sort of a contrast for red or white, and does a "sight," as the saying is, toward brightening your garden. There is, too, a pretty low-growing annual of the most intense perfect blue and good size, the *Convolvulus minor*, one of the morning-glory family. A bed of this, edged with white or yellow, is as pretty as anything you can imagine, and gives a dash of relief to the commoner reds and yellows.

The *Salvia patens*, one of the sage family, is another lovely blue, and as it grows rather tall is very striking if planted in bunches. Always put in as much of this color as you can, for the more you have the prettier your garden will be.

Don't clap in plants regardless of color, size or fitness, and wonder why it is that your garden "somehow doesn't look just right," and do, while you are about it, pay some attention to the color of your house, too. I know this is seldom done, but I can see no reason for allowing combinations out of doors which you would never think of allowing indoors. Don't, if your house is painted a deep, bright buff, put brilliant orange flowers around it; or, if it is the fashionable terra cotta, plant intense scarlet geraniums against it. There are so many pretty ways of planting that there is no need of such combinations.

Put your scarlet geraniums in a long sweep up against white marguerites. Both of these bloom constantly, and with a little trimming are always in good shape. In another spot put a clump of deepest pink geraniums, and up against them a mass of pale purple verbenas. In one corner, where it will not conflict with anything else, plant a mass of double yellow marigolds or deep purple verbenas.

Make whole beds of different colored verbenas, or double white petunias bordered with the scarlet verbenas. Somewhere, where you have space, put in a solid bed of pansies, and if they are backed by yellow, all the better.

Don't leave all reason and good taste behind when you start to make a garden. You wouldn't paint a picture, or, indeed, even arrange your parlor this way. You would go to the door and stand and look at it, and try the effect of this bit of color here, and that bit there, and arrange it after repeated trials, just to your satisfaction. Why can't you stand at the front gate and do the same? Why can't you say, "Let me see, that corner needs some scarlet," or "Right down here it ought to have some blue," and "Over there I think some orange would look well"? Why can't you, in short, use your good taste and judgment in this as well as other things?

The particular manner of laying out the shapes of beds and walks is for each individual to decide for himself, but no matter how poorly that may be done, if the place is properly planted, or good taste shown in its arrangement, a garden will always look well.

North Temescal.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Hopeful for America.

Robert Collyer, the beloved and famous Liberal Christian preacher, is now in California for a summer visit. An Oakland reporter, speaking with him of the ignorant and superstitious foreigners in the U. S., inquired: "Do you believe this element could subvert this Government if it were thoroughly organized for that purpose?"

Dr. Collyer answered: "I do not. I believe that if such a crisis should arrive, the American will meet the emergency firmly and effectually. I consider the American the grandest man on the face of the earth. He is slow to apply the crucial measures necessary to effect his purposes, but when the time comes he will assert himself with a power that will sweep all before him, leaving not a vestige behind."

"We must not judge of American energy or American principle by the ebullition of the great cities. We must look to the American of the agricultural districts, the mountain, plain, and valley, for the true sentiment that will oppose, with resistless vehemence, the mob of anarchists, socialists, and ignorant bigots of the metropolitan slums. But I do not apprehend any danger whatever from this quarter. These people have come to us with the mark of the oppressor's heel fresh upon their necks, and they are endeavoring to tyrannize over those who are weaker than themselves, as they have themselves been tyrannized over. They do not comprehend the principles of our Government and they mistake liberty for license. They are not worthy of American citizenship, and never will be."

"A great deal is said about ameliorating the condition of the poor, but I do not believe in it myself. It is a sentimental philanthropy that will have the effect of producing a race of mendicants and paupers more abject than those that to-day infest southern Europe. The poor of this country have the power to ameliorate their own condition and they should be compelled to do so."

"Moreover, I am firmly of the opinion that the American is fully capable of dealing with and forever settling this so called conflict between capital and labor, this antagonism between the laboring man and the corporation. The American will eventually come to judgment, and he will decide the question fairly and impartially. I may be an optimist in these matters, but I am convinced that I am right, and the future will prove the correctness of my assertions."

The Grange and Education.

We have in this country nearly 2,000,000 voters who cannot read or write, and we have 7,500,000 children out of the schools growing up in ignorance. It is a great problem: What are we going to do with this increasing ignorance? Intelligence and the ballot must go hand in hand in a country "of the people, for the people, and by the people." This already vast number of voters who can neither read nor write is a dangerous element in our politics. It is bought, sold, and handled "like dumb-driven cattle," and is a balance of power in many localities already. The Grange always has and will continue to push and advocate the cause of education. It has a special mission in this direction, not only as a local matter, but as one of national importance.

Our forefathers wisely established the free school at the same time that they established the free ballot. A ballot in the hands of an ignorant voter is as dangerous as a gun in the hands of a child, dangerous to himself and to those around him. As our population increases we must have an increase, and not a decrease, in intelligence, or our free institutions cannot be sustained.

There are generals who can command a brigade, who are failures in handling a corps. There are men who can conduct a small business in a country village, who would fail in carrying on a large wholesale business in a city. Men who would make excellent mayors of a city of a few thousand inhabitants, who could not act as the governor of a State. And so with our increasing millions of people and voters; we need more intelligence, higher statesmanship. The thousands of Granges scattered all up and down our land are the schools of political economy, the schools of citizenship, from which are going out more intelligent voters and legislators, State and national, prepared to grapple with the new issues that an ever-advancing age is bringing to the front.—*Mortimer Whitehead.*

BADGEY GRANGE, Illinois, has a "Missionary Committee," whose duty is implied in the name. They have ordered a lot of Grange literature from the Lecturer of the National Grange to distribute among farmers in their county. Every Grange should have such a committee, and every good Patron should feel it a duty to do volunteer work of the same kind.

GRASS VALLEY GRANGE gained eight members last quarter, and has just elected two more. They hold a meeting every Saturday night, and appear to be thriving.

Grange Work and Progress.

(Prepared Weekly by M. WHITEHEAD, National Lecturer.)

THERE has been another great corner in wheat. Fortunes have been made and lost. Of course the "break" came, as usual, just as farmers are busy harvesting the new crop, and the "bears" will rule, with low prices, until the main portion of the crop passes out of the hands of the producers.

Adam Smith thought wheat less liable than any other commodity to be monopolized by speculators, because "its owners can never be collected in one place." But this supposed impossibility is practically overcome by the railway and telegraph, and now Boards of Trade arbitrarily make and unmake the prices of food, and wheat is as easily "cornered" as anything else. A single firm in Chicago, five years ago, gained control of the pork market, more than doubled the price, and cleared over \$7,000,000 on a single deal, the influence of which was felt in every part of the world. Farmers should think of these things while busy in the harvest-field, remembering how little supply and demand, good or poor crops, has to do with the price he is to receive. It is all in the hands of gamblers. Organized farmers will one of these days put a stop to it.

THE growth of the spirit of speculation is ominous. The salaries of clerks, the business capital, the bank deposits and trust funds of all sorts, which disappear "on 'Change," indicate how wide-spread is the unhealthy haste to be rich. And such have the methods of speculation become that "The Exchange" has degenerated into little better than a euphemism for "gambling hell." While one bushel in seven of the wheat crop of the United States is received by the Produce Exchange of New York, its traders buy and sell two for every one that comes out of the ground. When the cotton plantations of the South yielded less than 6,000,000 bales the crop on the New York Cotton Exchange was more than 32,000,000. Pennsylvania does well to run 24,000,000 of barrels of oil in a year; but New York City will do as much in two small rooms in one week, and the Petroleum Exchanges sold altogether last year 2,000,000,000 barrels.—*Henry D. Lloyd.*

THE GRANGE in Oregon has, during the past year, steadily increased in numbers. Three new Granges have been organized and nine dormant Granges revived. Our business co-operation has increased and is in a healthy condition. A number of new Grange halls have been erected and dedicated. Every new hall is an important acquisition and aid in our work, for it creates a new center for general and intellectual culture, and is a rallying place for the farmers of the neighborhood. Under our influence, our agricultural college is being established as an institution exclusively devoted to the promotion of agricultural education and the development of practical farming. Wherever in any community an active, live Grange has long existed, better farming is done, fewer mortgages on the land, more ornamental trees shade the wayside and adorn the homesteads, and more culture and refinement are apparent everywhere among the people.—*R. P. Boise, Master Oregon State Grange.*

UNDER the title of "Men who Own Themselves," the *Kennett Advance* (Penn'a), says: "Farming may be a laborious and irksome business and the profits of agriculture discouraging, but there is one thing which the farmer may possess which every man in any other avocation may well envy him, and that is his absolute independence. Men engaged in trade frequently feel obliged to refrain from doing what they consider their duty, lest in its performance they may injure their business. In Kennett Square the house-to-house canvass for signers to a remonstrance against the granting of a license to our one hotel developed a number of cases of this kind, and two or three persons who signed the remonstrance were subsequently overcome by their fears and had their names stricken off, the fear of a boycott proving too powerful for their sense of duty. The farmer, however, has nothing of this kind to fear. He is absolutely his own master, and neither his religious, moral, political nor social beliefs or disbeliefs may in any way be used to the injury of his worldly prospects. He wears no man's collar. And after all, this is more desirable than riches or place. One's manhood is something more to be desired than something that has to be gained by constantly crooking the pregnant hinges of the knee, or bowing to the caprice and whim of people we may in our inmost soul loathe and despise. The Grange is educating the farmer how to use this independence, not only for his own good in correcting existing evils, but in helping those who dare not help themselves 'for the good of our country and mankind.'"

If any one can possibly be held back on account of the Grange being a secret society, let me say to such that the secrecy of the secret societies, so called, in this State, compares with the social, fraternal and moral objects of those societies as the secret threads in the binding of your Bible compare with the contents of the Bible. I have belonged to a number of the secret societies, so called, and it seems to me that all these societies' secrets are but as the little hidden, almost inconsequential, yet necessary threads which held the members together in a brotherhood for the accomplishment of worthy objects, as the secret threads in the back of a book bind together in a precious volume what were otherwise loose and scattered leaves.—*John D. Lyman, Lecturer N. H. State Grange.*

"HIGH TAXES, extortionate interest and exorbitant rates of transportation are rapidly pauperizing the millions and multiplying our millionaires. These evils can all be cured by legislation." Yes, and the Grange is educating farmers and their sons in political economy and how "to take a proper interest in the politics of our country."

PROGRESS.—Five more new Granges—one each in Connecticut, Oregon and Alabama, and two in Pennsylvania.

THE officers of the Illinois State Grange have planned an active campaign. The State has been divided into three Lecture Districts, in charge of Major E. A. Giller, State Master, O. Wilson, State Lecturer, and J. R. Miller, each to choose his helpers. Preliminary work to be done in the Subordinate Grange at once, and then pushed after harvest.

The Secretary of the State Grange, Thomas Keady, writes: "Most of our Granges are in a hopeful, and a good proportion of them in a flourishing condition, receiving new members and making an impression for good in their several neighborhoods."

RED WILLOW GRANGE, No. 628, Nebraska, has just received 17 new members, and has fresh applications under consideration.

ARKANSAS has a called meeting of her State Grange this month. Mississippi holds her Patrons' Union July 19. Texas State Grange commences August 9. Alabama holds her State Grange meeting the last of August.

"WRONG breaks ranks, and right is leading; Sleep not on unstirred, unheeding."

Danville Grange on Interstate Commerce.

The following peculiar report of a committee of one was recently adopted by Danville Grange:

Worthy Master: Your committee, to whom it was assigned to draw up resolutions expressive of the sentiment of this Grange on the Interstate Commerce Act, beg leave to submit the following:

WHEREAS, The great wheel of misfortune has again completed its circuit in the matter of the Interstate Commerce Act, and again, as usual, the people stand head down at the bottom, while the oily-skinned plutocrats dance on high the step of victory; be it

Resolved, That, in our judgment, it is the sacred duty of the farming classes especially, with the people, in a body, to rise from their dogged submission to self-selected political slave-drivers, organize and arm themselves with the ballot, a proper sense of right and justice, a determination to see it enforced, and go to the polls with a sovereign vote for men, regardless of fossilized party mania, electing as their honored servants, and not their dreaded rulers, men from among their own ranks, whose profound learning has not unfitted them to see the needs and hear the demands of common people.

Resolved, That, in our judgment the conviction of the New York aldermen and other signal victories of law against disorder of late are the signs of the times that indicate a return to our original customs, that of a government by and for the people, as opposed to by and for a moneyed aristocracy, and that we have unbounded faith in the restoration of the people to power in the near future.

SONOMA POMONA GRANGE.—The next regular meeting of Pomona Grange of Sonoma county will be held in the hall of Santa Rosa Grange, on Wednesday, July 20, 1887. There will be a good deal of important business, and not a little social enjoyment. The usual Grange dinner will be served, to which only Grangers will be admitted. The following program appears in the *Republican*: Opening song, by double quartet of Sebastopol Grange; select reading, L. J. Hawkins of Santa Rosa Grange; address, by Edwin Peterson of Bennett Valley Grange; vocal duet, by Mrs. G. W. Huntley and Miss Wightman; address, by S. T. Coulter of Santa Rosa Grange; vocal solo, by Mrs. Huntley; reading, by Will Crain of Bennett Valley Grange; select reading, by Miss Emma Mills of Santa Rosa Grange; double quartet, by members of Sebastopol Grange; "Good of the Order;" closing song, by Grange.

THE FARMERS' CO-OPERATIVE UNION of Sutter county is one of the powerful and beneficial institutions of that county. Its object is to promote agriculture, horticulture and stock-raising. It has a capital stock of \$50,000. The officers are G. W. Carpenter, president and manager; Hon. George Ohleyer, secretary; B. F. Walton, treasurer. The directors are G. W. Carpenter, George Ohleyer, B. F. Walton, Hon. A. L. Chandler, A. H. Wilbur, J. H. Kimball and James Littlejohn. They have a balance sheet showing from \$150,000 to \$250,000. The union owns two warehouses of grain and other produce of a capacity of 15,000 tons. They sell and ship grain for the farmers, and receive deposits of money. This union of farmers has done incalculable good to its members and to the community generally.—*Dr. Latham in Record-Union.*

GEN. THEODORE WAGNER's beautiful residence on San Pablo creek, in Contra Costa, was burned up Wednesday night, the 6th. Nothing was saved but the piano and some chairs. How the fire caught is not stated.

BERKSHIRES AND SHROPSHIRE.—Mr. Andrew Smith of Redwood City, long known to our readers as a breeder of prize pigs, has just received direct from England four Berkshire swine (his fourth importation) and 13 head of Shropshire sheep—the very finest that he could secure in Great Britain by expert selection. Among the sheep are three young rams which Mr. Smith intends to dispose of—thus affording breeders a rare opportunity of securing a choice imported animal at reasonable expense.

HANDSOME APRICOTS.—It would be hard to produce dried apricots much finer than some which J. W. A. Gilmor of Vacaville sent to Jas. Linforth, a few days since, and the latter brought in for us to see and taste. We do not know that we have ever seen their superior in richness, flavor and beauty of appearance. They were prepared in one of the Zimmerman evaporators, whereof Mr. Linforth is general agent for the Pacific Coast.

THE HAY-FORK SWINDLER is again abroad in the land, and this time it is the Los Angeles county farmer who is credulous enough and green enough to oblige the scoundrel with his autograph.

AGRICULTURAL NOTES.

CALIFORNIA.

Butte.

HORSE-POWER PUMP.—*Gridley Herald:* Last Thursday evening we visited Mrs. Levi Smith's little fruit ranch a mile north of town, to witness the operation of W. B. Bishop's patent horse-power pump. The horse-power consists of a circular tilting table, 20 feet in diameter, upon the top of which the horse walks. The table tilts about 28 inches. On the east and west sides of the platform—the beam upon which it oscillates running north and south—connections are made with the ends of walking-beams 20 feet long. At the other ends of these beams the pumps are attached—one at the outer end of each beam working in a 10 inch well. The weight of the horse is the motive-power, causing the table to tilt, thus raising or lowering the beam and working the pump. The fulcrums upon which the walking-beams work can be so changed as to increase or decrease the length of the pump stroke, thus giving the horse more or less power, as may be desired, increasing or decreasing the flow of water. It is the simplest and at the same time most effective horse-power pump we have ever seen.

Contra Costa.

SAMPLE PRODUCTS.—*Martinez Item:* Capt. F. Babbe has sent to the Board of Trade rooms some apricots, apples and plums, that tell volumes for the fertility of the soil in the vicinity of Babbe's Landing. One branch of an apple tree contains 40 apples, although it is not three feet long. Samples of early apples are superb, while the plums and apricots cannot be excelled. A bunch of alfalfa, two weeks' growth, measures 21 inches in height. It is cut, not pulled up by the roots, and was grown without irrigation or cultivation. Babbe's Landing is about five miles north of Brentwood.

El Dorado.

ROYAL INDEED.—*Georgetown Gazette:* The Royal Ann cherry tree on the premises of Mrs. C. H. Jones, from which she has just picked and sold 230 gallons of cherries, this season's crop, has been carefully measured by Jos. F. White, with the following results: Circumference of trunk, 7 ft. 5 in.; of first branch, 3 ft. 3 in.; second branch, 3 ft. 4½ in.; third branch, 4 ft. 3½ in.; fourth branch, 2 ft. 6 in.; fifth branch, 2 ft. 7½ in.; sixth branch, 2 ft. 2 in.—all below four feet above the ground. Height of tree, 30 feet; diameter across tree top, 57 feet one way and 60 feet another. Age of tree, 24 years. These cherries sold readily at 50 cents per gallon, and were purchased by J. A. Campbell for the Newcastle shippers, who forwarded them to Chicago for the Fourth of July trade. The Newcastle dealers declared these cherries to be the finest they ever handled.

Fresno.

RETURNS FROM A SMALL VINEYARD.—*Fresno Republican:* I. A. Grout, on lot 28, Central California Colony, had 1000 vines of the Muscat variety. These vines are set eight feet apart, hence would cover just one acre and a half of ground. Being sick and unable to care for the crop when ready to pick, Mr. Grout sold the grapes to Col. Forsyth on the vine for \$18 per ton. The vines yielded 19 tons of grapes, bringing Mr. Grout \$345 for the acre and a half, sold on the vines. Had the second crop been harvested, about three tons more would have been secured. These vines were six years old from the cutting, and give promise of yielding 23 or 24 tons this season.

A CLUSTER OF CRABAPPLES.—J. G. Tuttle has brought us a twig from a Siberian crab-apple tree. The twig was 11 inches long and about the size of a lead pencil. Growing upon it in a cluster resembling an enormous bunch of grapes were 85 fair-sized crabapples. Taken from the twig they weighed four pounds exactly. Mr. T. has two of these trees, and says every branch is loaded, and the trees are only prevented from breaking down by the fact that their bodies are short and the bending branches rest their burden upon the ground. Two years ago the fruit from these trees sold for \$15, and the yield will be double this year.

Humboldt.

EDITORS PRESS.—I have just returned from a trip through Pepperwood, Ingleswood, Meyers, Phillipsville (commonly called Snuffville), and Sliverville. I met Mr. Tuttle driving eight yoke of as fine graded Durhams as ever went over this road. They are sold for work cattle to the Occidental Mill Co. of Eureka. He had also an Ashburner bull, which is generally pronounced the best in this part of the county—weight 2200 pounds. The yield of wool was never better; feed was good throughout the ranges; Mr. Tuttle reports 108 bales. At Phillipsville they have just got through haying; 30 acres of volunteer yield over 50 tons. Mr. Stegmeyer was taking a few boxes of peaches, the first ripe ones around here. At Ingleswood they are very busy haying yet. It was 92° in the shade at 12 o'clock, and at Rio Dell it was about 58°, with a heavy fog at 5:30—considering it is only about 22 miles, it is quite a change. Yesterday it was 98° in the shade in the draft at Jacobson valley. Land can be bought for \$300 per acre at Rio Dell, planted in fruit.—*E. P. S., Rio Dell, July 13d.*

Inyo.

HE KNEW BETTER.—*Independent,* July 9: Four years ago John S. Gorman bought and located 280 acres at Camp Independence. He

had been a miner and never had any experience in farming before. When he went upon the land he was laughed at for his ignorance. "It was no good. Nothing would grow upon it. There was no water for it. The soil was full of alkali, and, worse than all, nothing could be got from the land without work." Mr. Gorman was not scared by the last assertion, and he did not believe the others. He planted corn, wheat and oats where the alkali was supposed to be thickest; he made deep drains to carry the water away from the land they said was too dry. Since the drains were made the soil is far more fertile than before. No stagnant pools of alkaline water are left to poison cattle; running streams flow through the pasture, and the cattle are rolling fat and as slick as otters. At present he has 60 acres in alfalfa, 40 acres of which were broken up and seeded this spring. The newly seeded land will give a fair crop this season. The total hay crop will be quite 200 tons; part of this will be wild hay, of blue joint, red clover and other native grasses. Fifty-five acres are in grain, including corn, wheat and oats. Ten acres are laid out for orchard, six being already planted, and some of the young apple and peach trees are now bearing. Mr. Gorman began raising horses three years ago; he started with a few head of good mares, and now has 25 head of as good horses as the county can show. His success shows the value of energy, industry and good hard common sense. The old fogies who laughed at him when he started now begin to rub their eyes. Perhaps they would try, if it were not for the fact that to try means to work.

Mendocino.

THE HOP-GROWERS.—*Ukiah Press*, July 8: The Mendocino County Hop-Growers' Association met last Saturday, but a quorum not being present, adjourned for two weeks. President L. F. Long called attention to the advantages to be derived, both by growers and pickers, from the adoption of boxes in which to pick hops, stating that boxes were in general use everywhere outside of this part of the State; and he read a description of the standard hop-box of Washington Territory, as follows: They are 5 feet 10 inches by 2 feet 10 inches at the top and 4 feet 14 inches by 1 foot 4 inches at the bottom, all inside measure; the corner posts should be of fir and 2x2 square; the box when completed should be 28 inches deep on the slope of the sides and ends; the lower board of both sides and ends should be fir 1x4 to nail the bottom to; the bottom should be one board 3x17, and in this country could be made of redwood; above the 1x4 at the bottom of the sides should be a 3x10 of redwood, then the handles 3x10 and last another 3x10 for the top; the handles should project about 10 or 12 inches past the ends of the box, and be rounded at ends; the ends are made of two boards 3x10 placed next to the 1x4 strip at the bottom, and capped with another 1x4 at the top to keep the boxes from being split by being piled in each other; the corner posts should be on the outside of the box, and in cutting the lumber for the sides an allowance of 2 1/2 inches should be made for each end of the box. The ends are made first, the lumber being cut neat measure, and the sides put on a piece at a time, the bottom being nailed on last and over all. The handles should be put on with ten-penny nails; the 1x4 strips with eight-penny; the bottom with a six-penny, and the 3-inch stuff with four-penny.... Another important matter was mentioned—that the brand of the Mendocino Hop-Growers' Association has been fraudulently imitated, and buyers thereby deceived into believing they were buying Russian river hops when they were not; and it was suggested that the association had a duty to perform in enforcing the law.

Monterey.

CROPS.—J. S. Tibbitts in *Index*: Following is a brief statement of the condition of the growing crops throughout the county for the month of June, as ascertained from correspondents at Gonzales and Monterey, and from personal observation: Taking 100 as the standard of comparison, corn stands at 75, wheat 40, barley 50, potatoes 75, beans 50, peaches 100, apples 75, grapes 100, pasture 75, hay 75. Amount of wool sheared compared with last year, 100.

Napa.

POPE VALLEY ITEMS.—*St. Helena Star*, July 8: June apples, peaches and apricots are now ripe here, and blackberries will soon be abundant. Wheat harvest is near its height, and the weather for the past week has been regular harvest weather, the mercury ranging from 90° to 100°. Many fields in this section are bearing finer crops than for several previous seasons. Vineyards are looking well, the warm weather rapidly developing the grapes. The vine luxuriates in the sun, and in consequence of our long, even spring, our vineyards will not on an average yield so abundantly as last year.

SILKWORMS.—*St. Helena Independent*: Mrs. M. F. Imann has successfully carried 15,000 silkworms through the season. As it requires 300 cocoons to the pound, it will be seen that the lady raised 50 pounds, all of which were in first-class order and which sold for \$1.40 per pound, yielding her nearly \$75. Counting the time actually given to the work, she estimates that the income is equal to \$2 a day.

San Diego.

OUR VARIED PRODUCTS.—*San Diego Union*: We attended a dinner party recently in this county, at which the entire menu consisted of articles grown, raised, made or caught within 10 miles of where we dined. We had green

turtle soup and Spanish mackerel, caught in the ocean near by. A young steer from the herd of our host supplied the fillet of beef. The pepper and limes for seasoning, and the olive oil for the mayonnaise, as well as the guavas which furnished the jelly, came from the garden under our window. All manner of vegetables, including green corn, cucumbers, and green peas, with oranges, strawberries and peaches, were likewise from the garden aforesaid. We had canvas-back duck from the lagoon below the house, and quail from the mesa above. Banana fritters were prepared from plants which grew in the ravine at the foot of the garden, and we drank as fine sherry and claret made from grapes grown on the ranch as were ever imported from Spain or France. There was no coffee, for that had not been raised, but there were tea plants growing in the garden from which we might have had tea if so inclined. The raisins and Zante currants for the pudding were also from the ranch. Is there any piece of ground in the civilized world, outside of this favored land, where such a dinner could be prepared from home products? We think not.

San Luis Obispo.

STACKING SQUIRRELS.—*Las Tablas Cor. Tribune*: Over 2800 squirrels have been killed and piled on Ed Smith's fine ranch by Mr. Benton and assistants. They showed me one pile that had over 600 dead squirrels in it, and numerous others with their hundreds. The buzzards had a regular picnic, coming from every direction to feast. Mr. Benton and Mr. Smith think they did not find one-half that were killed. Just think for a moment, 5000 squirrels on one ranch! What an enormous amount of grain and range they would destroy! Mr. Smith thinks that the amount of grain destroyed on his place would pay all the expenses of harvesting the crop, say one sack to each squirrel.

Santa Barbara.

HONEY SCARC.—*Independent*, July 9: Kelley Bros., who run an apiary in the Santa Ynez, were in town last evening. Out of their 400 colonies of bees they report that there will be little if any honey gathered this season. This seems to be the case with not only the apiaries in Santa Barbara county, but Ventura, Los Angeles and San Diego as well.

Santa Cruz.

DOMESTICATING THE WILD RASPBERRY.—*Courier-Item*: Some of our orchardists have been experimenting with the wild raspberry, to ascertain whether it will be profitable to cultivate, as the berry ripens much earlier, and the vine is a very prolific bearer. Their experiments prove that with cultivation the berry improves in size, and is of much finer flavor than in its natural state.

Solano.

EDITORS PRESS:—The weather is pleasant and warm, and has been fine for sun-drying fruit. The main business here now is taking care of the apricot crop, which is pretty well gathered in Pleasant valley and on Putah creek. In Vaca valley we are in the midst of gathering it. Thousands of pounds of fruit have been lost this season between Vacaville and Putah creek on account of heat, high winds and lack of help. Hands to work are very scarce. The driers are run to their full capacity, but do not accomplish as much as was expected of them. Those that dry in the sun have had no trouble with the machine. The finest fruit that I have seen this year was put up by Mr. Thissell, in Pleasant valley. He sun-dried a large crop and has sold to Porter Bros. of S. F. at 12 1/2 cents per pound for first grade, and 10 cents for second grade, sacks found. He has also contracted his peaches at 16 cents for peeled and 10 cents for unpeeled. Dryers are paying from 20 to 25 cents per 100 for cutting apricots, cutters boarding themselves. Mr. Dobbins of Vacaville has a large number of girls, boys and women at work. I have heard no complaint about the work not being done well. Sun-dried apricots are selling for 12 1/2 cents per pound at Winters and 10 cents at Vacaville. The apricots on young trees near Vacaville are turning black at the pit and cracking. This is supposed to be due to excess of moisture in the soil, which causes the fruit to ripen at the pit too soon. Many 'cots ripen and begin to decay inside, while the outside is perfectly green. There are various opinions about sulphuring. Some contend that 15 minutes is long enough, while others sulphur three hours. I think the time required to make it look well depends on the condition the fruit is in. If it is ripe and of good color, 30 minutes is long enough, but if it is green or bruised, one to two hours would make it look better; but I think the fruit is really better without any sulphur.—G., Vacaville, July 10th.

TONS OF FRUIT.—*Dixon Tribune*, July 9: One hundred and sixteen tons of fruit were shipped from Vacaville Tuesday. This is said to be the largest shipment ever made from that station. It was estimated that on the same day 100 tons were dried at various places in and near town. This gives a slight idea of the immense quantity coming into market from the fruit belt, and there are hundreds of acres of orchard yet to come into bearing.

Sonoma.

CANNED FRUIT IN DEMAND.—*Telegram from Petaluma*, July 10: The owners of the cannery had orders for 6500 dozen cases of fruit in their patent glass jars, and now comes an Eastern dealer, who wants all they can put in the jars. Although the capacity has been more

than doubled, they will run to its extreme limit.

HOPS.—*Democrat*, July 9: The hop prospect within the last two weeks has brightened perceptibly. Prices have increased to 20 cents, at which figures a few crops have been contracted. The indications are favorable for an average crop, and growers generally apprehend no difficulty.

Sutter.

BOUNCING BARLEY.—*Farmer*, July 8: Last week we stated that J. W. Messick of Meridian had thrashed from a certain field 77 bushels of barley to the acre. Mr. Messick's modesty did not permit him to go any higher. Since then his neighbors have measured the field, and found it of less acreage than was supposed, which runs up the yield to 94 bushels per acre.

Tulare.

NEW FRUITS.—*Delta*, July 7: The Barr seedling apricot, which originated in Visalia, is one of the finest varieties of that fruit grown. It is of a very light color, showing a slight greenish tint when ripe, smooth skinned, and has a very agreeable flavor. It would be an excellent fruit for our orchardists to grow on a more extensive scale.... I. H. Thomas has on exhibition at his fruit store some samples of the Prunus simoni, or apricot plum, from North China. The fruit when ripe is of a dull brick-red color and flat, being 6 1/2 x 5 1/2 inches in circumference. The fruit is very firm and meaty and has the appearance of being a good shipper; ripens soon after the wild goose plum. This is probably the first that has ripened in this State.

Yolo.

DRIED 'COTS.—*Winters Express*, July 9: The cannery finished cutting apricots for drying on Wednesday last. Altogether they have handled 250 tons of fresh fruit, which made about 50 tons of dried fruit. They would have cut as much more but for the north wind, which burned the fruit on the trees. The company gave employment for over three weeks to an average of 100 persons, and paid out for labor alone over \$2000. The fruit dried is of first quality and will undoubtedly command top prices. This enterprise has been a big item in the business of our town this season.

SPONTANEOUS COMBUSTION?—*Woodland Democrat*: Monday afternoon a barn on Bryte's dairy ranch, on the Yolo side of the river, was destroyed by fire, together with 100 tons of hay and several agricultural implements. The fire seemed to burst out over the whole building at once, and consequently is not thought to have been incendiary. Possibly the hay was packed too closely, and occasioned spontaneous combustion. Great care should be taken by all farmers not to pack hay too closely. When put in the barns it is always more or less green, and generates an enormous degree of heat.

NEVADA.

GRAIN EXPERIMENT.—*Reno Gazette*, July 7: Quite an encouraging result has been obtained from the experiment of planting grain where it can only get the natural rainfall in Spanish Springs valley, 12 miles northeast of Reno. To people passing along the road, the field makes as good an appearance as an average Colusa county grain-field. The wheat and rye are yellow, and look ripe and strong. The barley is a rich green patch between the two pieces of older grain. On closer inspection, the rye is found to be a very tolerable crop, considering that it is the first time the land was ever plowed and that it could not be cultivated very deeply. It started out fairly and got a stalk over two feet high. The wheat has headed out and is filled, but the grain is small, of course, for reasons given above. The Australian rye grass made a good set. The plants did not come up very thick on the ground, but they look strong and healthy. It is a perennial plant, and if it lives through the season it will make a noble pasture. The field will be plowed and sowed again with almost a certainty of a much better result next year.

OREGON.

MOTTLED COLT.—*Willamette Farmer*, July 1: Mr. C. Cunningham of Fort Klamath had an equine curiosity in Ashland, Saturday, which attracted much attention—a handsome spotted colt, as even and symmetrically marked with the two colors as if painted by an artist from a balanced design. The colt is four months old, and came over the mountains beside its mother, who was in a working team. Its sire was a mottled horse owned by H. P. Deskins, and said to be a descendant of one of the oriental breeds allied to the Arabian stock. Nearly all the colts gotten by this horse have been marked in a similar manner, showing a characteristic which must have become firmly fixed in the breed from which he sprang.

CORRECT NAME.—Our correspondent McD. asks to have the name of our old friend Blanchard, which occurs repeatedly "In the Santa Paula Country," on the second page of this issue, so changed as to read Nathan W. Blanchard. That page being already off the press, we take this way of making the desired correction.

WE notice another of our exchanges has fallen into calling a new style dairy factory a "creamatory." The word is a little too warm in its suggestions. "Creamery" is the accepted term.

Santa Barbara Jottings.

[Written for the RURAL PRESS by L. B. CADWELL.]

Crops throughout the county are looking well. There has been no hot, blasting weather here to injure the prospects. Harvesting the grain in the west end is progressing. The Lima bean crop in the east end is at least as promising as in former years.

Many apricots are going to waste in Goleta, Montecito, and Carpinteria valleys, the raisers not having taken the necessary steps to save them. Many placed dependence on the hope that the Coleman drier would buy them; but the company was not anxious to secure them and offered but three-fourths of a cent per pound, delivered at the drier in Santa Barbara.

Apples are very full; also most varieties of pears—Winter Nellis and Beurre Bosc being the exceptions—and they are not troubled with codlin moth. The pears are free from blight—better than for some years past. Peaches, nectarines, plums and prunes, are very full. Grapes promise better than for many years. English walnuts are estimated at one-quarter above the average yield.

The County Horticultural Society had its regular monthly meeting on the grounds of Mr. P. C. Higgins, Carpinteria, the 6th inst. About 75 members and friends were present and the meeting was full of interest. A long table was spread in the shade of oak trees and a grape arbor, and a fine dinner indulged in. The society thinks of incorporating under an agricultural charter, which would enable it to hold and improve property. The city of Santa Barbara will present them with one of the plazas when so incorporated. This society is one of the liveliest, gets up many good fairs, and aids greatly in the advancement of the county. Mr. H. C. Ford has been its president for many years—since its organization, in fact, and their success is largely due to his efforts and zeal in the work.

The great beds of asphaltum in Carpinteria are about to be used for street paving and sidewalks. A San Francisco company has leased the beds on Mr. Higgins' ranch and is now experimenting with the material. The deposits of bituminous rock in this valley may yet be used for making gaslight. The railroad company's graders set fire to this rock two or three months ago, and it is still burning. The fire covered one-quarter to one-half an acre, and burned so fiercely at times as to greatly hinder the work on the railroad.

The terminus of the S. P. Branch railroad is now at Carpinteria. The graders are working with all haste to get to Santa Barbara by August. The railroad company is going to build a fine depot at the latter point, and it is said will put up a fine hotel on the Hope ranch, which they have bought for the purpose. This hotel promises to rival the Del Monte for accommodations. It is the intention of the railroad company to boom Santa Barbara as a health resort; and certainly no better place can be found for that purpose. Much building is going on in the city and everything points to its material prosperity.

Carpinteria, July 10, 1887.

Stockton Notes.

[Written for the RURAL PRESS by Mrs. W. D. A.]

Two weeks of the harvest are gone and the work is at its height, with satisfactory working of the Houser, Holt, Myers and other machines, and a better yield than was expected from the severe drouth and sudden heat of May 27 and 28. All grain is shrunken somewhat, save at New Hope, on the islands, and in exceptional fields. A field near, that was plowed in just after the last rain and was too young for the May scorching, is yielding a plump berry and finely. Summer-fallow is fair throughout the county.

Average wheat brings \$1.72. Some sold their crop before harvesting and haul from the harvester to the warehouse. The past week has been very hot, with good wind. Thermometer 102°. If a match was touched to one of the dry fields, all creation would be on fire, so dewless are the nights, so fiercely bright the days. It is a good year for windmills, and the ground, not having had half the usual rain, demands frequent watering.

Four capitalists from San Diego county bought the controlling stock of the Mokelumne Ditch and Irrigation Co., and with the largest stockholders, Messrs. Langford, Sargent, Kettleman, Treadway and others, will begin the work so that water will be brought down before another harvest. They expect to water at least 300,000 acres.

The Stanislaus Ditch and Irrigation Co. has incorporated with directors, M. F. Tarpey, Dr. Gibbons, J. S. Morris, J. D. McDougald and J. Gambetta, to take water from the Stanislaus for the adjacent lands and Stockton.

Beetles are nearly gone, but linnets secured most of the cherry crop and are now at work on figs. Apricots were good and plentiful; so are peaches. Pears and apples are less wormy this year. Housewives are busy canning, pickling and drying the fair yield of fruit.

On the Fourth, Stockton and its hotels were full of visitors, who came to see the glorious day's parade and the evening's "Horribles," with their burlesque oration by the young and witty lawyer, Arthur Levinsky.

It is well for the Sons of the Golden West that they took this day in hand and reminded us of patriotism, and to inculcate it in our children.

Stockton, July 6, 1887.

Little Coats.

[Written for the RURAL PRESS by FANNIE H. AVERY.]
 "Moreover his mother made him a little coat."—I Samuel, iii: 19.

'Tis long since Samuel's mother wrought
 A little coat for him to wear,
 In token of her loving thought,
 Her tender, unforgetful care.

Strong emblem of maternal love!
 Sweet story from a distant age!
 We mothers prize it far above
 More striking themes on history's page.

For we, too, fashion little coats,
 For loved ones of our own to-day;
 While Fancy many a banner floats
 Above our needle's gleam and play.

The prophet's mother's hopes and fears,
 Her love, are changeless links that bind
 Our hearts to hers through all the years,
 And ebb and flow of humankind.

A Woman as a Locomotive Engineer.

For some time there has been a good deal of quiet talk among railroad men in the vicinity of Bridgeport, Conn., of a singular discovery that a woman disguised in male attire had been running an engine for many months. The fact has been kept secret by the railway officials, and was at first received with incredulity by their subordinates, but is a fact nevertheless. The heroine is an English girl named Mattie Morgans, who came to this country about two years ago after serving an apprenticeship as stoker on the Great Northern railway, between London and Edinburgh.

She concealed her sex so cleverly that she readily secured a position as fireman on the Naugatuck railroad and was eventually promoted to the post of engineer, first on a freight and afterward on a passenger locomotive, a post which she might have held to this day but for her voluntary retirement about six months ago. The cause of her retirement is told below in her own words. Five years ago Mattie Morgans, then a pretty girl of 19, fell in love with Tom Winnan, an engineer of the "Flying Scotchman." Tom's run was from King's Cross Station, London, to York and return alternate days. The Government contract calls for a forfeiture of a pound sterling for every minute the train is behind schedule time, which seldom happens.

Several evenings a week Mattie Morgans would wait at King's Cross and listen for Bow Bells and St. Paul to ring out 7 o'clock. With that hour would come thundering into the station the "Flying Scotchman." Tom Winnan and the royal mail. Weeks and months passed, and in that interval Tom Winnan, after his day's work was done, would stroll out to Hyde Park, St. James', Kew Gardens, or perhaps float up and down the Thames with his fair young friend. She would listen to the thrilling recitals of his adventures until she learned to love her hero as Desdemona loved the Moor. She yearned to fly through the air with him and share the dangers, excitements and triumph of a life so foreign to her own. It is not an uncommon thing in England and Scotland to find men's work performed by women, and what more natural than in this case to find woman's love of adventure, curiosity and love overcoming all objections. A short time only was required to bring out her plans. With Tom's earnest assistance she was duly installed as stoker under his charge, her rough fustian suit and face purposely besmeared with coal dust and oil completely disguising Tom's sweetheart. Day after day the "Flying Scotchman" engine No. 362, with seven-foot drivers, and just from the shops at Dundoon, flew over the rails at the rate of 52 seconds to the mile, honest Tom's hand upon the throttle and his sweetheart fighting at the fire-box. Never minded she the steam, the dust, the roar, neither confusion nor fatigue, for Tom's cheery words and encouraging smile were ever ready, and his strong arms saving her the heavy burdens from day to day. It was her pride to keep the steam gauge pointing at high-pressure mark. She understood the duty of oiling and cleaning, and was always ready to "hook out the grate" or "set the guide cup."

The engine had no cab, but instead the conventional English dashboard, an almost useless thing against a storm. It was not

long before her face became weather-beaten, which, together with the coal dust and grime, made the chance of discovering her identity less and less. Tom was very careful. He watched to see that no meddling engineer should observe that his "stoker" was a woman. So matters went on for nearly a year. Tom and she were to have been married. With the forethought of Traddles in "David Copperfield," bits of furniture and household utensils were bought, and the day looked forward to for happy housekeeping; but fate had decreed otherwise; Tom Winnan was killed. He was run over in the switchyard by a shunted car and died within an hour, his head upon his "stoker's" lap. It was then, when in anguish, Mattie Morgans betrayed her womanhood.

She fled the country and came to the

a relief engine. I suppose you will think it strange if I tell you that I have been inside of my engine's fire-box, but of course it was cold. I have also been inside the spark-arrester and shifted the diaphragm. Once while running a passenger train I keyed-up and fastened a slipped eccentric. We were running 40 miles an hour when it happened. I shut off, gave her sand, turned the air-cock for brakes, and brought up the train all standing. My fireman and I climbed under the forward driver-axle and pried the eccentric into place. The passengers gathered about and looked on. My fireman climbed back into the cab and worked the lever until the links came into place, and then I tightened the set screws holding the eccentric in place. I could not adjust the 'throw' to a nicety, and in consequence the 'lead'

from my trade. I cannot even refer to it without a shudder. I was running my train with a new engine, No. 120, and was going nearly 50 miles an hour. Far ahead on the track, between the rails, I saw something white which I thought was a piece of newspaper. As I drew nearer, O horror! it was a little child. It was sitting facing me and playing with the dirt and stones. I reversed and tried to stop, but it was impossible. As I got nearer the little thing looked up and clapped its hands apparently in delight of the big engine, and in an instant the ponderous monster had passed over it. I almost fainted, but stopped the train. The people went back. The poor little thing was ground to atoms. That was my last trip. That child haunted me day and night. I was taken ill and when at last I recovered I resumed my skirts. You have in Bridgeport, Farini (the photographer), who so many years was 'Lulu' and electrified audiences in Europe and America as a beautiful and shapely young girl. At Niblo's Garden 'Lulu' broke the hearts and won many favors from rich men. 'Lulu' was hurled from the catapult. He was shot out of a cannon. From concealed springs on the stage at Niblo's he was fired to dizzy heights, and his graceful figure deceived the poor deluded men into offers of marriage. 'Lulu' made a living by his disguise. Why should not I do the same? It is an even exchange. But I am done with my disguise, for I am going to be married. My affianced is a stationary engineer, and has charge of the 60-horse power engine in one of the large manufactories. After I am married I hope to be able to make a visit some time to England and point out to my husband the 'Flying Scotchman' where first I learned to run a locomotive."

Mattie Morgans is but 24 years old. She has light-colored banged hair, dark eyes, and is quite handsome. Her face approaches, perhaps, the masculine and has a determined expression of character, yet withal it lights up with pleasant smiles and betrays in unguarded moments the gentler feelings of the weaker sex.

Francis Scott Key.

Among the many handsome bequests of James Lick was one of \$60,000 for the erection of a monument to the memory of Francis Scott Key, author of the National Hymn, "The Star-Spangled Banner." In a few days this monument will grace the Golden Gate park, and add one more to its many attractions. The contract for the structure of this monument was awarded February 7, 1885, and the eminent American sculptor, W. W. Story, was selected to design and construct the beautiful tribute of honor. Mr. Story went to Rome, and in the desolate palace of Barbeni for two years toiled upon his task. It is now complete and is *in transitu* to this city. Work has been commenced in the park in the children's playground, south of Conservatory valley.

The accompanying cut is from a photograph taken from a model of the monument. The two main statues and bas-reliefs are of bronze, while the monument proper is carved out of travertine, a calcareous stone, sometimes known as Tufaceo marble. It is a reddish-yellow, slightly variegated with dark-blue lines, and its durability is amply attested by St. Peter's Cathedral, at Rome, portions of the Colosseum and the Porta Civita Vecchia, all of which are in perfect state of preservation. Mr. Story suggested travertine because its yellowish tone was agreeable to the eye, and it was susceptible of the most delicate artistic finish.

The monument will, perhaps, be one of the largest and most imposing in California. It will be 51 feet from the base to the top of the flag. The figure of America surmounting the flag will be eight feet high, and that of Key will be little larger than the life size. The reader may see from the cut that the figure of America stands in a bold attitude and embodies the spirit of patriotic freedom. In her right hand she holds the "Star-Spangled Banner," the folds gently drooping over her back. The pedestal upon which America rests is a delicately beautiful block of marble, each corner of which is surmounted by a miniature eagle, the typical bird of liberty and power.

The figure of Key is one of graceful pensiveness; his head resting on his right hand with a far-away look. It is the poet sitting in an attitude of thought. The bas-reliefs on the sides of the monument will be four feet in height and will be in bronze. The side presented to view in the cut is a group of figures singing the "Star-Spangled Banner," and on the other side is a fac-simile of the verses as written.

The philanthropist in making his bequests was anxious to leave some token of his patriotic love for his country, as well as his

JAMES LICK'S MONUMENT TO FRANCIS SCOTT KEY,
 Author of "Star-Spangled Banner."

United States. Her stock of money began to dwindle. What to do next puzzled her. The situation daily became more alarming. Desperate at last she determined to disguise herself again and apply to some railmaster of motive-power for a place as fireman. She was not long in securing a situation upon a Connecticut railroad, and after serving for nearly two years was appointed as engineer of a freight locomotive.

Perhaps her experience is best told in her own words:

"Yes, I was appointed engineer of the night freight. I had a 74-mile run and old '27' was my engine. The first night I ran, a forward strap of the main rod broke. I disconnected the main rod, covered the 'ports,' wedged up and fastened the 'cross-head,' and crawled 20 miles with only one side working, losing less than one hour of my running time. Then we got stalled in an up-grade and stood there till morning for

was a trifle 'off' on one side, so that when we started again the 'exhaust' barked unevenly, sounding like the exhaust of an engine properly 'quartered.' I performed this job in six minutes, which drew considerable attention from the railroad men. I received a letter of commendation from the superintendent and was shortly thereafter given the 'day express' to run. I never had any serious accidents, but I have killed two men. One was walking on the track; I blew and blew for him, but he did not hear me and was struck. The other man attempted to drive his wagon over a grade crossing. I struck him and killed him and his horse also.

"These accidents had a strange effect upon me. Of course I was not to blame and was exonerated by the officials, but seeing these men killed produced insomnia. I could not sleep. Their faces were constantly staring at me. I began to run down in health and my last accident drove me

gifts to science, charity and education. His own soul had been stirred and thrilled by this national ode. A monument to the memory of the gifted soul whose patriotic words had so long been the inspiration of the American people, and had become an imperishable part of their literature, seemed to Mr. Lick eminently fitting.

Francis Scott Key was more than a poet, he was an eloquent lawyer, and honored by the generation who knew him as a worthy citizen. He died suddenly in January, 1843, in the city of Baltimore, and was buried in the Mount Olivet Cemetery. Years after a plain marble slab was placed at the head of his grave by the Hon. George H. Pendleton, who married the poet's daughter, with this inscription: "Francis Scott Key, born August 9, 1780; died January 11, 1843."

Some attempts have been made to erect a more fitting monument to the poet, but they were unsuccessful. A bill was introduced in Congress by Congressman Unger, of Maryland, for this purpose, but nothing came of it. Afterward a bill was introduced into the Maryland Legislature praying the donation of \$5000 for a monument, but the measure failed. It is more than likely the name of the author of the "Star-Spangled Banner" would have gradually faded from memory, but for the thoughtful patriotism of James Lick.

The recent kind and liberal act of Mr. W. W. Corcoran in bringing home and furnishing an honorable burial of the remains of John Howard Payne, author of "Home, Sweet Home," was a noble and graceful tribute to the memory of one who had made so many hearts happy and invested home with a new charm. It refreshed the dear old song in memory and seemed to give a sweeter charm. The monument that will soon be a prominent ornament in our Golden Gate Park will not only keep alive the memory of Key, but will cause us all to sing with new fervor the immortal effusion of his patriotic heart.

The Heated Term.

Perhaps there is no country in the world where so many people enjoy themselves in the woods, up in the mountains, by the seashore and various other summer resorts, during the heated term. The President has just got home from a fishing bout in the Adirondack woods, and no doubt wishes he had staid there longer. His Constitutional advisers are all seeking rest and recreation somewhere. Congressmen are scattered as widely as the leaves whose breezy shades they are wooing. There is no politics worth speaking of. There is just enough business to keep the wheels of trade in motion. Now that the Fourth of July is over, Uncle Sam is inclined to snooze and take things easily.

As we are prone to take pleasure in contemplating the misery of others, the restlessness of other lands may give some zest to our summer siesta. England is still tugging away at the Irish question; France and Germany are making faces at each other and playing at mimic war; Russia is plotting how to outwit the Nihilists; Italy is still in the feverish flurry of trying to be somebody, and ever and anon are flitting rumors of the Pope's health. Surely it is a great blessing and comfort to live in a free country that has nothing to fuss and flurry about, that does not care to fight anybody and has got so big that no one cares to fool with it, and where the people are content with the present and proud of the future. About the only trouble we have is to know how to dispose of our surplus money. We have the Anarchists here and sometimes they throw bombs and make threats, but they are merely a sort of itchy pustule or parasitic vermin on the surface of the body politic, producing an irritating sensation, but in no wise endangering the political life and health. Happy the people who have no special National ambition only to be happy, prosperous and at peace with all the world.

YOUNG LADY (educated in Boston)—Have you any genuine maple molasses?

St. Louis grocer—We have some that are very fine. How many?

Young lady (recoiling in horror and moving toward the door)—None at all, if you please. Is there no store on this street where English is spoken?

It was the late Granville Moody, the "Fighting Parson," who at the battle of Stone River rode along his lines, shouting: "Give 'em hell, boys; give 'em hell in the name of God and your country;" but the pious old man always insisted afterward that what he really said was "Give 'em Hail Columbia."—*Burlington Free Press.*

A GOOD bill that no legislature ever passes: a thousand-dollar bill.—*Jersey City Argus.*

YOUNG FOLKS' COLUMN.

Dobbin's Friend.

Dobbin has a little friend,
Spotted, white and sable;
Every day she goes to him,
In his lonely stable.

Not a mite of dread has she,
Not a thought of danger;
Lightly runs between his hoofs,
Jumps upon his manger;

Lays her soft, warm cheek to his,
Purs her meek "good-morning!"
Gives the flies that hover near
Such a look of warning!

"Dobbin, dear," she sometimes says,
"Feel my winter mittens;
Nice and warm, you see, and made
Purposely for kittens."

"Dobbin, dear, such times at home!
Mother has caught a rat!
Brought it home to show to us—
What do you think of that?"

"Now, Dobbin, if you weren't so big
I'd take you to our house,
And give you for your supper, dear,
A plump, delicious mouse!"

"Dobbin!" she whispers, purring still,
"You often get so weary;
Why don't you balk or run away,
And get your freedom, dearie?"

Then Dobbin gives his head a toss,
And says, "For shame, Miss Kitty!
If I could do so mean a thing,
'Twould be a monstrous pity."

"No, no; my master's good and kind;
I'll never vex him, never!"
And Pussy, pleased, still rubs his cheek,
And likes him more than ever.

How Howard Bought the Baby.

Howard is a little boy, only six years of age, and lives with his papa and mamma in a village in the State of Michigan. One day he came running into the house, calling "Mamma, mamma!" and seemed very much excited. His mother asked him what he wanted.

"I do wish," said Howard, "we could buy Mrs. Lamb's baby. He puts his little arms around my neck and hugs me so cute."

"Buy Mrs. Lamb's baby!" exclaimed the astonished mother.

"Why, yes," answered the little fellow. "I will take care of him all the time. We can buy his clothes, too; and you won't be bothered one bit."

"But," said mamma, "Mrs. Lamb will charge more for her baby than we are able to pay."

"I know what we can do," said Howard. "We can trade something for him."

Mamma laughed, and said: "I don't think of anything I can spare, unless it may be the basin of soft soap the soap-man left here this morning. But, as Betty is doting on that for scouring the kitchen floor, you will have to ask her about it."

Away went Howard to the kitchen.

"Take it along. Oh, law! what a child!" said Betty, when Howard made known his wish.

In a few minutes Mrs. Lamb was surprised, on answering a knock at her back door, to find there a small, red-faced boy with a large basin of soap.

"I've come to buy your baby and all his clothes with this soap," said the little man.

As soon as Mrs. Lamb could speak for laughing, she said:

"Do you think I would be willing to part with my dear little baby for a basin of soap?"

"Oh, I do want him so much! Can't you trade him for something?"

"Well," answered Mrs. Lamb, "I might trade him for a big boy that I wouldn't be obliged to carry in my arms."

"Oh, goody good!" exclaimed the delighted boy. "I'll trade Fred for him, and send him right over when he comes from school." Fred was Howard's brother.

"Take the soap home, and I will put the baby in his cab, and you may come back and get him," said Mrs. Lamb. Howard ran home, and told his mother that he and Mrs. Lamb had made a trade, and that he would soon have a sweet little baby all his own.

In a short time, Howard appeared at the front gate, looking very happy indeed, and wheeling the baby carriage. "Mrs. Lamb says she will give me the clothes when Fred comes. She wants time to pick 'em all up," he explained to his mother, who had been inquiring after the wardrobe. His mother told him that he had better amuse baby by wheeling the carriage about the lawn, and then returned to her sewing.

All went well for a time; but, by and by, the baby became tired, and began to cry. Howard sang, turned somersets, whistled and played all sorts of pranks, but to no avail. The baby only cried the louder. He then in despair called his mother; but mother was too busy, and only reminded him of his promise. It was not long before Mrs. Lamb saw a tired and disgusted boy enter the gate, with her baby screaming at the top of his voice.

"Mrs. Lamb," said Howard, "you needn't 'spect Fred over. I don't want to keep this baby always. When I do want him, I'll borrow him."

Cats to Give Away.

The following "cat essay," by a couple of misses of Oak Vale school, was read in their school paper at the close of school on last Monday:

Great big cats and little young cats; All extra good for catching rats. There are 12 in number different size; And whenever one squalle, the old ones rise. Some yellow, some gray, some spotted, some black; But I must say, in meanness, not one of them lack. They may always be found in the house at night; And I'm sure a preacher would swear and fight. If your back is turned, or you're out of sight, They lick the pots and dishes just for spite. But the most are young and if trained with care, would be better cats than you'd find anywhere. If you don't believe it, come up and invest in a few, and you'll greatly oblige Dolly, and Eva too.—*Santa Maria Times.*

HARRY AND CHARLEY—aged five and three respectively—have been seated at their nursery table for dinner. Harry sees that there is but one orange on the table, and immediately sets up a wailing that brings his mother to the scene.

"Why, Harry, what are you crying for?" she asks.

"Because there ain't any orange for Charley."

GOOD HEALTH.

Wrinkles.

Wrinkles are due to the gradual wearing away of flesh underneath the cuticle. Why does it wear away? Because the facial muscles have either too little or the wrong kind of exercise. It will be observed that wrinkles usually take a downward course. This is due to the wrong kind of exercise. What exercise? Why, the washing and wiping of the face, to be sure. Reverse the process, and, instead of rubbing the face down in washing and wiping, always rub upward. This will have the effect of counteracting the tendency of the flesh to depart from under the cuticle, and will keep the face free from wrinkles. It is rather an awkward habit to acquire at first, but perseverance will make it second nature, and the result is worth many pains. This exercise is designed particularly for the benefit of the eyes and the upper portion of the cheeks. Then, for the middle and lower portion of the face, where hollowness rather than wrinkles is often noted, another plan must be taken. The facial muscles are subjected to very slight activity in the ordinary exertions of eating and talking. To fill the cheeks out round and plump it is necessary to develop the muscles there. These muscles are very slight at the best, and any special effort well directed will increase them in capacity and size. An excellent exercise for this purpose is this: Take a piece of soft leather—kid or chamois skin will do—and put the end of it between the teeth; then chew gently upon it for several minutes, taking care not to raise the teeth from the leather. If the teeth are raised it will bring into play only the ordinary muscles of mastication, whereas the purpose is to develop those that are seldom used. One who tries this method will find the cheek going through a queer action that is anything but graceful and pretty; nevertheless, it is immensely effective and will restore to its youthful plumpness even the most hollow cheek. Try it faithfully and you will be convinced.—*Journal of Health.*

REMEDY FOR THE POISON RHUS (OAK).—I notice in January issue that Dr. Frank Jones considers a strong solution of bi-carbonate of soda the most efficient application for the cure of rhus poisoning. Nearly 20 years ago I was first poisoned while botanizing, and have been poisoned every year since, from one to four or more times. I have tried the above named remedy and numerous others, and now use exclusively a strong (saturated) solution of alum, which relieves me quicker than any other application ever did. I would remark that, as is well known, the rhus affects different persons in different degrees, and some not at all; and I have thought it may also affect them in a different manner, as I have known several persons, one of whom would experience greater relief than another while using a similar remedy. Therefore all may not be so readily relieved by the application of the alum solution as myself and others to whom I have recommended it, but to all whom the soda bi-carbonate does not cure, I would say, try the alum solution.—*C. A. Ubeck, in Gardeners' Monthly.*

THE USES OF LEMONS.—Lemons are one of the most useful fruits in our domestic economy. Lemonade is not only a luxury, but exceedingly wholesome. It is a good temperance drink. The juice of half a lemon in a glass of water, without sugar, will frequently cure a sick headache. If the hands be stained, there is nothing that will remove the stain better than a lemon or a lemon and salt. After the juice has been squeezed from the lemon, the refuse can be used for the purpose. Lemon juice and sugar, mixed very thick, is useful to relieve coughs and sore throats. It must be very acid as well as sweet. Lemon juice is also a very good remedy for rheumatism and the so-called biliousness of spring. In the latter case the juice should be taken before breakfast.

DOMESTIC ECONOMY.

Bread-Making.

The *Milling World* gives the following facts, which will be of interest not only to all housewives, but to flour manufacturers as well:

A barrel of good flour should make from 270 to 285 five-cent loaves. Many bakers blend four brands, as two Minnesota springs and two Indiana winters, before they get the right alloy. Others use only one grade of spring and two of winter wheat. These make the best brands of fancy bread. Formerly yeast was made of malt, potatoes and hops, and this is extensively used. Fancy bread bakers use a patent yellow compressed yeast. It is popularly supposed that bakers use alum extensively in order to whiten their bread. That is not the fact. There is no necessity for the use of alum, and it is not used in the trade. There are about 20 large steam bakeries in New York, which give employment to several hundred men. One of these, a noted Broadway establishment, makes a specialty of Vienna bread and does an immense business. Vienna bread is made in air-tight ovens, of the best grade of flour, and milk is used instead of water in mixing the dough. In baking, the steam settles back on the bread instead of escaping. This makes the outer crust thin and tender, and gives the bread a peculiarly rich taste and pleasant aroma. What is known to the trade as "steam" bread is another recent invention. It is made of the very finest of flour and baked in air-tight pans, which inclose it on all sides. It is thus baked in its own steam, and possesses a flavor peculiarly its own. One very large bakery in New York is devoted solely to the production of aerated bread. It is a steam factory, and the bread so made is extremely light and spongy. The invention is an English one, but has been in use here for years. When the dough has reached a certain consistency, it is run into an air-tight cylinder and strongly impregnated with carbonic acid gas. This creates the lightness and sponginess without detracting in the slightest from its nutritious qualities.

RICE PUDDING WITHOUT EGGS.—Two quarts of milk, two-thirds of a cup of rice, same of sugar, small piece of butter and a little salt; stir occasionally on the stove until boiling hot, then put in a slow oven and cook until of the consistency of cream.

FLOUR GEMS.—One egg, one tablespoonful of sugar, two tablespoonfuls of butter, 1½ cupfuls of sweet milk, three teaspoonfuls of baking powder, 2½ cupfuls of flour. Beat well, have your gem pan hot and buttered. Pour in and bake quick.

WHITE CAKE.—Two cups of sugar, one cup of butter, five eggs, beaten very light, one cup sweet milk, 3½ cups of flour, two tablespoonfuls of cream of tartar and one of soda. Flavor with bitter almonds or vanilla.

PUFF PUDDING.—One pint of boiling milk and nine tablespoonfuls of flour; mix first with a little cold milk. When cold, add a little salt and flour, three well-beaten eggs, and bake in a buttered dish. Serve at once.

LEMON SODA CAKE.—One cup of sugar, one tablespoon of butter, two eggs, one-half cup of sweet milk, one teaspoon of soda, two teaspoonfuls of cream tartar, one pint of flour measured after sifting.

EXCELLENT CAKE.—Take one cupful of sugar, three cupfuls of flour, 1½ cupfuls of milk, half a cupful of butter and two eggs; mix thoroughly, adding two teaspoonfuls of baking powder. Bake in a hot oven.

MINT SAUCE.—Chop fine one bunch of mint, mix with it a tablespoonful of white sugar, a pinch of salt and pepper each, and five tablespoonfuls of vinegar. Stir well and serve with roast lamb or veal.

YANKEE MUFFINS.—To one quart of milk add one gill of yeast, one teaspoonful of salt, with four or five eggs beaten. Add flour sufficient to make a thick batter. Bake in muffin rings. Serve with butter.

LEMON JELLY.—The yolks of two eggs, one cup of sugar, one cup of water, one tablespoonful of cornstarch and the juice and grated rind of one lemon. Cook till thick. This is nice for layer cake.

MOCK SAUSAGE.—Soak dry bread in water. Take as much cold meat, chopped fine, as you have bread. Mix, and season with salt, pepper and sage. Make into small cakes and fry in hot lard.

BEEF CAKES.—Cut cold beef in slices and soak in vinegar over night, then dip in beaten egg seasoned with salt and nutmeg, roll in dried breadcrumbs and fry in butter to a nice brown.

GRAHAM FLOUR PUDDING.—One cup of graham flour, one cup of sweet milk, one cup of molasses, one cup of chopped raisins, one teaspoonful of soda. Steam three hours.

GINGERBREAD.—One cup of molasses, one-half cup of butter, two tablespoonfuls of water, one teaspoonful of soda, flour enough to mold. Roll out thin and bake in a quick oven.

SALAD OF SALMON.—Cut some cold salmon into slices or pieces about the size of a dollar, garnish with capers and strings of lettuce hearts; pour a salad dressing over the whole.

The Week.

A good note can be made of the progress in irrigation endeavors. Our columns from week to week have mention of organized effort here and there for the utilization of idle waters, and the result must be great toward the upbuilding of the regions interested. Upon large enterprises there must always be conflict of opinion and sometimes of interests, but there is quite a commendable spirit of union and co-operation in most of the efforts which have been undertaken.

The cloud of litigation on the water question seems also to lift now and then; one of the most cheering rifts in the cloud this week being the dismissal of the riparian suits brought against irrigators using Kings river water. This action of the court will give peace and a great progressive impetus to the adjacent land in Fresno and Tulare counties.

Crop reports are still good, the increased yield in some fields being very satisfactory to the owners. According to all reports, every one who wants work can get plenty of it, and there is some complaint of a lack of hands. It is, of course, the busy season, but as our industries multiply, the opportunity for labor widens. Thus may it continue.

Advertising Methods.

A very interesting chapter might be written on the science of advertising, as it has been amplified and improved with the growth of magazines and newspapers until it has nearly reached the last degree of perfection. It is a wonder that Herbert Spencer or some of his disciples have never taken up the history of this art in order to illustrate the doctrine of evolution. The earliest methods were of the clumsiest sort. They seemed based upon the theory that the more cumbersome the vehicle of information the greater the importance of the information they conveyed. The first we hear of advertising was by public orators, a method still in vogue in some parts of Europe and even in this country, and the red and black lettered theatrical posters of the ancient Romans still hold their place on the bill-boards and deadwalls of the present day. It was a considerable period after the establishment of the newspaper before it was recognized as the cheapest, quickest and most effective way of advertising.

In the early period of advertising journalism, the merchant who wanted to proclaim his wares was fond of making his notice cater at the same time to his personal or lyrical vanity. To simply and tersely state the facts, the kind of goods for sale, merits and prices, was hardly thought sufficient. The merchant himself, or some rhymester employed for the purpose, would set forth the excellency and desirability of the goods in jingling doggerel. The effusion often gave only the faintest idea of what was to be bought, but if some odd quirk or queer conceit was woven into the lines the end was attained. It was hoped that while the reader laughed at an epigram, he would remember that Jones' goods were really going at a fearful sacrifice, or that fortunes were to be made by patronizing Smith's store. But it was soon discovered that the public laughed and that was the end of it. The jingling lines gave no reason why one should trouble himself to visit one shop or store more than another.

The newspaper has not attained its present supremacy without a struggle. For a long time it had to divide the honor of the most sedate merchants with all sorts of sonorous and violent devices. Banners, wagons bearing garish signs, harlequins, street bands, processions, strange animals, and divers other attractions have been employed by auctioneers and even merchants. Much of this sort of advertising is still employed by traveling shows, patent medicine vendors, flaring posters, marching elephants, painted mules, the calliope and street parades. On one of the deadwalls of Market street may be seen a group of California's greatest men in the complacent attitude of puffing Pet cigarettes, and in depots and other public places may be seen the portraits of the most beautiful girls as the trademark of some new brand of cigars or tobacco. Even the Maltese cross and other fraternal society devices may be seen doing duty on claret bottles and petroleum cans. Hardly a day passes that we do not learn of some sensational device to attract attention. A New York bootblack could scarcely keep soul and body together till he took it into his head to jump off the Brooklyn bridge, and now he earns \$100 a week in a dime museum. A few days before the charming Sara came to the United States, we had a cock-and-bull story of a duel between a high-toned Frenchman and Italian caused by some criticism of the French actress. The Prince of Wales is one of the best advertising agents of the day in giving London stars a lift into notoriety.

But while all these and various other allurements may be resorted to, the newspaper is bound to absorb the bulk of the advertising patronage of the world. The reason is obvious. It is the chief medium of information. It goes everywhere. It is valuable intrinsically, and its advertising columns reap the benefit of all the thought and money expended on its news and editorial pages. The newspaper has become the public bureau of information. It is the place where everybody looks to find everything. No catch-penny trick or perambulating street device can ever rival that daily and weekly budget of simple, necessary facts, to know which is the intellectual bulwark of millions of people. Recognizing all this, advertising in journals is the most important part of legitimate trade. For saying the most in the fewest words and in the most

striking way habitual newspaper advertisers are pre-eminent. It is only necessary to scan the columns of the RURAL week after week to realize how far the art of placing facts before the public, not only in a way that arrests attention, but that stimulates inquiry and inspires confidence, has been studied and practiced.

Interesting Figures on Fruits.

We have just received the report of the Chief of the Bureau of Statistics at Washington, giving exports and imports of the United States for the eleven months ending June 1, 1887, and the corresponding period of last year. We select first as of especial interest to our fruit-growers the figures relating to importations of dried fruits for the periods described above:

Kind of Fruit.	Pounds.	1887.	1886.
Figs.....	8,723,137	7,218,290	
Prunes.....	90,697,169	64,008,596	
Raisins.....	40,388,273	39,995,725	
	Values.		
Kind of Fruit.	1887.	1886.	
Figs.....	\$487,557	\$505,038	
Prunes.....	2,971,040	1,998,705	
Raisins.....	2,269,456	2,861,619	
Preserved fruits.....	656,706	797,852	
Totals.....	\$6,386,759	\$6,163,214	

This shows that, notwithstanding the respectable figures which our production of these fruits is reaching, the importation of them is increasing. Even reckoned upon the basis of value, this appears, and if figured in weight the increase would be greater, for the prices or valuation per pound is shown to be less this year than last. The deduction would be that the population of the country, or at least the consumptive demand for these articles, is increasing faster than the California production of them. This is a hopeful condition of affairs for California, for it postpones indefinitely the time when our product shall oversupply the demand of this country. Although we look forward to ultimately turning hither the millions which are now going to the Mediterranean regions for these fruits, we can well afford to wait for the victory, which will be all the greater when it comes. To the prune-growers especially the figures are comforting, for, although they may be forced to take comparatively low prices for their fruit, the prospect for actual overproduction of prunes seems quite remote, as the United States imported nearly a million dollars' worth more in 1887 than the year before.

The importation of semi-tropical fruits and grapes also reach interesting figures, as follows:

Kind of Fruit.	1887.	1886.
Lemons.....	\$3,286,639	\$2,182,191
Oranges.....	2,104,643	1,798,971
Other fruits (not bananas).....	1,758,065	1,386,048
Nuts—Almonds.....	517,934	640,186
All other nuts.....	663,386	550,015
Totals.....	\$8,330,667	\$6,528,651

The weight of almonds was 4,547,683 pounds in 1887 and 8,770,836 pounds in 1886.

Thus it appears that during the year ending on the 1st of last June there were brought into the United States nearly \$15,000,000 worth of dried and green fruits and nuts, the production of nearly all of which has gained considerable importance and extent in California. In nearly all cases, as we remarked above, the importation is increasing in spite of California's contributions to the national supplies. It certainly does not appear that California's work in this direction is likely to be overdone, providing we can stand competition with foreign producers in the matter of cost; as to style or quality, we are quite sure that we can excel.

Fruit for the East.

According to telegrams and Eastern exchanges received, the sale of California fruit on the auction plan is progressing favorably. There has been a little brush in Sacramento between the Union and the Bee, or rather the Bee seems to have been doing a little brushing all by itself. The complaint seems to be that the Union officers do not tell what the fruit sells for because the rates are so high that local buyers cannot get any fruit and that the Union is helping buyers by not publishing prices. It is not long since the Union was abused because it would not tell prices because they were so low; now it is abused for not telling them because they are so high. It is hard to please some people, but we imagine if the shippers by the Union get good prices and

quick returns, it will be all right. If they do not do so we shall probably hear from them.

Reports from the East are very favorable so far. On Saturday last Mr. Blowers telegraphed that the receipts for the first five cars in New York were as follows: First car, \$1500; second car, \$1740; third car, \$1503; fourth and fifth cars, \$2700 for the two together. Auction sales have been arranged for in Boston and Philadelphia, as well as in New York. The regular auction days in New York will be Tuesdays and Thursdays through the season. The fruit seems to strike the East just right, after the Florida oranges are gone and before the Northern fruits come in. Mr. Blowers thinks about half of all the fruit shipped from California can be sold to advantage in the Atlantic Coast cities.

The Eastern peach crop this year is reported short. Both New Jersey and Delaware are said to have but one-quarter of a full crop. Eastern peaches will come in about September 1st, and then it will be desirable to act cautiously with California shipments.

The Coming Fairs of 1887.

The season of annual fairs comes on apace, and the notes of preparation are sounding in all directions. Here in San Francisco the directors and agent of the Mechanics' Institute are busy, while the rivalry between them and the promoters of the State Fair has been the occasion of so brisk and extensive a canvass that both exhibitions may be gainers thereby.

The new pavilion at Stockton will be added this fall to the number of fine exhibition buildings put up in the State within a few seasons, and the Mechanics' Pavilion, in this city, is undergoing enlargement.

We give below a list of displays to come, arranged in order of their dates, and shall be grateful for any aid from officers of different associations in filling gaps or correcting errors, as we intend to republish it from time to time for the convenience of our readers:

Bay Dist. Assoc., S. F., Aug. 6 to 13.
S. Clara Valley Agric. Soc., San Jose, Aug. 15 to 20.
Sonoma Co. Agric. Park Assoc., Santa Rosa, Aug. 22 to 27.
Fourth Dist.—Sonoma and Marin—Petaluma, Aug. 29 to Sept. 3.
Eighth Dist.—El Dorado—Placerville, Aug. 30 to Sept. 2.
Thirteenth Dist.—Sac, Yolo, Yuba and Sutter—Marysville, Aug. 30 to Sept. 2.
First Dist.—Alameda, Contra Costa and S. F.—Oakland, Sept. 5 to 10.
Third Dist.—Butte, Colusa and Tehama—Chico, Sept. 6 to 10.
Seventeenth Dist.—Nevada and Placer—Grass Valley, Sept. 6 to 10.
Cal. State, Sacramento, Sept. 12 to 24.
L. A. Co. Pomological—Los Angeles, Sept. 12 to 17.
Ninth Dist.—Humboldt and Del Norte—Rohnerville, Sept. 20 to 25.
Nevada State, Reno, Sept. 21 to Oct. 1.
Second Dist.—San Joaquin, Stan., Merced and Tuol.—Stockton, Sept. 26 to Oct. 1.
Fifth Dist.—S. Clara and S. Mateo—San Jose, Sept. 26 to Oct. 1.
Nineteenth Dist., S. Barbara, Sept. 27 to 30.
Tenth Dist.—Siskiyou, Trinity and Shasta—Yreka, Sept. 28 to Oct. 1.
Sixth Dist.—L. A., S. Bernardino and Ventura—Los Angeles, Oct. 3 to 8.
Eleventh Dist.—Plumas, Lassen, Modoc and Sierra—Susanville, Oct. 3 to 8.
Seventh Dist.—Monterey and S. Benito—Salinas, Oct. 4 to 8.
Fifteenth Dist.—Tulare and Kern—Visalia, Oct. 10 to 15.

Fire! Fire!

Within the past month, newspapers in different parts of the State have published scores of paragraphs like the following:

"A destructive fire broke out this afternoon in a grain-field on the ranch Buenaventura, about three miles northeast of Cottonwood. The heavy clouds of smoke that rolled heavenward drew crowds of people from that town and Anderson, and soon hundreds of spectators were viewing the awful destruction of fences, headers, header-wagons and grain. Full 2000 acres of grain was burned, and we are informed there was but little of the grain and other property destroyed insured."

"Yesterday a fire broke out on the farm of J. Kneebone, south of Grass Valley, destroying a quarter section of grain, and spreading to his son's place adjoining, destroyed a like amount."

"About nine o'clock this morning a fire started at the Branigan ranch, and, driven by a strong north wind, spread rapidly through the hills, devouring everything in its path. The whole country is swept clean from the public road to the Sacramento river, a distance of five miles. Fifteen miles of fencing belonging to

John Barry has been burned. If the wind continues blowing no one can imagine the result."

In many cases the origin of the fire is stated, for instance: "Sparks from a passing locomotive caused quite an extensive fire at the Nadeau Eucalyptus grove at Florence this afternoon. Ten acres of trees were burned down, and about 100 cords of dry cut wood were destroyed. The damage will probably exceed \$5000." Again: "Sunday morning as the train going south pulled up at the depot at Tehama, fire from the ashpan was blown into Supervisor Mooney's wheat-field near the depot. Miss Mattie Tartar jumped into a buggy, drove to town and notified the citizens, who soon rallied and put the fire out before it had gained much headway. The engineers should be more careful in the future."

Again: "There was a fire in the dry grass, about half a mile east of the Woodland depot, Thursday afternoon, that for awhile had a serious aspect. A number of boys had been shooting with a shotgun in the dry grass, using paper wads. Ten minutes later the fire was observed by some person passing. The alarm was given and a brigade of men and boys, armed with wet sacks and buckets, were soon on the field hard at work, and after almost superhuman endeavors, the fire was quenched and all danger averted."

On "Honest John" Baker's Tehama county farm an old man was blacksmithing, when a piece of hot iron flew out the door and set fire to the grass. The flames spread rapidly over several hundred acres, mostly pasture-land, before the rallying neighbors could extinguish them.

This very week a furious fire near Loomis swept over two miles square, burning a large amount of fencing, pasture and woodland, and scorching vineyards and orchards. This blaze was supposed to have been started by careless hunters or campers.

Matches let fall where the sun shines hot upon them and sets them off in the dry stubble, may occasionally be the beginning; but the careless smoker, dropping the match with which he has lighted his pipe, or throwing away the stump of his cigar, is perhaps the most frequent kindler of these disastrous summer conflagrations.

Comment is unnecessary.

The Danger in Wheat Gambling.

We had the satisfaction of warning our wheat farmers when the fever was on them, that selling futures on wheat was a dangerous business. It seems now, according to the *Stockton Independent*, that some from that neighborhood have been caught in rather a peculiar way. We quote:

"Some of the speculative farmers who wanted to catch the top prices then offered for July and August delivery, sold large lots of No. 1 wheat, signing contracts to deliver that grade. They sold at from \$1.75 to \$1.85. Now when they have commenced harvesting they bring in samples of their crop and find it will not weigh up to the standard. They have entered into written contracts to deliver No. 1 wheat, according to the Produce Exchange standard, and let me tell you that there is but little wheat in this section of the State that will weigh up to the standard."

Farmers who made such sales must deliver wheat which will weigh 60½ pounds per bushel, for that is the standard this year. If their weight does not weigh that they have to buy some wheat that is up to the standard to fill their contract. The *Independent* tells of one case like this:

One Stockton farmer, who owns land in this county, in April last sold 500 tons of No. 1 wheat. His crop has been harvested and he can't find one bushel in his own grain that will help to make good his written contract. He is now in the market hunting for wheat that will weigh 60½ pounds to the bushel.

We are sorry when a producer gets into such a trap, but such is always the danger when one goes into gambling. It is no part of legitimate production nor of legitimate trade. If a buyer wants the wheat, taking chances of the growth himself, it is well enough to sell to him, but when a farmer guarantees the weather he does something which his experience should have taught him is dangerous, to say the least of it.

A. T. DEWEY has just returned, with his family, from a vacation in Lake and Napa counties, where he devoted four weeks entirely to recreation.

ENTOMOLOGICAL.

Natural Foes of the Cottony Cushion Scale.

We have given from Prof. Riley's forthcoming report sketches of the life history of the cottony cushion scale, *Icerya purchasi*, which seem to have proved very acceptable to our readers. An esteemed correspondent in St. Helena writes as follows:

I have specimens in my collection that came from trees in Napa City several years ago. These trees were cut and burned, and it may be there are no more *Iceryas* in this vicinity, but, as they are known to have been here, I would suggest the careful watching for them. Your exhaustive articles in the *PRESS* will certainly properly educate readers so they can recognize the pest if it should occur in the future.

It will be acceptable to know that some progress is being made in discovering natural foes of this scale, although it must be acknowledged none yet found have an appetite commensurate with the reproductive power of the pest. The idea of sending a skilled investigator to

Neither Mr. Coquillett nor Mr. Koebele observed any bird feeding upon it. The reason for this exemption is probably the copious secretion of wax, which is doubtless distasteful. Several reliable persons report that ducks and chickens feed greedily upon those scale insects which are dislodged from the trees. On one occasion a brood of six young ducks gorged themselves upon scales which had been washed from the trees with pure water, and on the same day two ducks died. On the day following three more died, while the sixth recovered after an illness of several days. This disastrous effect was probably due to the greed with which the scales were eaten, as they were said to produce no such result with chickens which ate them at the same time.

Predaceous Insects.—The only predaceous insect observed by Mr. Coquillett to feed upon the cottony cushion scale was the larva of a species of lace-wing fly (*Chrysopa* sp.), which was not bred and cannot be named more exactly.

The ambiguous lady-bird (*Hippodamia ambigua*) has been noticed feeding upon the eggs when they were exposed to view by the egg-sac being broken open; but neither this nor any other species of lady-bird was seen to feed upon the adult insect, although commonly attracted by the honey-dew secreted.

Among the predaceous insects found by Mr.

lows: "Upon one occasion (August 25, 1880), I found within the body of a full-grown female [of *L. olea*] a lepidopterous larva. * * * The specimen, however, was lost, and no more have been found since." From the fact that this larva destroys living black scales, we have every reason to believe that it will also feed upon living cottony cushion scales, and will not confine itself, as heretofore observed, to the dead females and their empty egg-sacs.

In his report Prof. Riley gives a full description of this new species.—*EDS. PRESS*: A common Tenebrionid beetle (*Platynus brevicollis* Lec., Fig. 2), was found by Mr. Koebele to occur abundantly among the rubbish at the foot of the trees infested by *Icerya*. Egg-sacs which had been completely eaten out and the eggs devoured were found in close conjunction with several of these beetles, and in consequence a few beetles were placed in a pill-box with female scales and large egg masses. In a few days the eggs were all eaten, but the insects themselves were not disturbed. It is probable that this is not the normal habit of this beetle, yet it may without much question be put down as an occasional destroyer of *Icerya* eggs. The habits of the allied *Epitragus tomentosus*, as described by Mr. Hubbard in his report on "Insects Affecting the Orange," p. 75 (Fig. 36), render this all the more probable. The *Epitragus* was observed to feed upon scale insects of all kinds in Florida, tearing the scale from the bark and devouring its contents, and sometimes also the substance of the scale itself.

The larva of a Dermestid beetle (*Perimegatomus cylindricum* Kirby, var. *angulare*) was also found among the cottony cushion scales, but as it would only feed on dead scales in confinement, it is not likely that it is truly predaceous.

Prominent among the true bugs found upon the infested trees is the large brown *Largus succinctus*, Fig. 3. This is said to destroy the scale insects, although Mr. Koebele could never see it do so. He noticed it feeding upon the honey dew, and on one occasion noticed two immature specimens with their beaks inserted in a male larva of *Icerya*. They ran away on his approach, and the larva was found to be dead; but as there were numbers of other dead larvae about, he did not consider that there was any evidence of the predaceous habits of the *Largus*. On the contrary, he observed this insect often with its beak inserted into young shoots of orange. The other Heteroptera found by him among the scales were the well-known *Piezodorus* sp., *Corizus hyalinus* Fabr (Fig. 4), *Peritrechus luniger* Say, *Beosus* sp., *Lyctocoris* sp., and *Piezostethus* sp. These last five species have been kindly examined by Mr. Uhler, our best authority in the suborder, and he reports the undetermined species as probably new.

The most efficient destroyer of the cottony cushion scale at Los Angeles is perhaps a species of earwig, family Forficulidae (Fig. 5), neither the genus nor species of which we are able to determine, from the fact that we have only seen immature specimens. According to Mr. Koebele this insect is often met with among the scales, and, from observations which he made, feeds greedily upon the *Icerya* in all stages, tearing open the egg-masses and eating the eggs, and also tearing and eating the mature insects as well as the larvae.

Parasites.—It is a somewhat remarkable fact that no true parasites were ever bred from the cottony cushion scale until the past summer, and still more remarkable that in the course of their careful investigations, extending over a space of six months, neither Mr. Coquillett nor Mr. Koebele succeeded in finding a single parasite upon this insect. From a number of scales, however, sent to Washington by Mr. Koebele November 10th, we bred, on December 8th, two specimens of a small Chalcid, which is, without question, a true parasite of *Icerya*, as the female scales from which they escaped were found each with a small round hole in its back.

This little parasite (Fig. 6) is prettily marked with black and yellow. It is new to our fauna and may have been imported with its host. We turned it over to Mr. Howard for study, and as he finds it necessary to erect a new genus for it, it is named *Isodromus* n. g. Howard.

This genus belongs to the Encyrtinae, and is more closely related to *Homalotus* than to any other described genus. Its structural affinity to this genus is quite marked, but it is well separated by the characters italicized above. It differs in habit also, as *Homalotus* is parasitic upon coleopterous larvae of the families Coccinellidae and Chrysomelidae. The specific name is *Isodromus iceryae*, n. sp. [The report gives full descriptions of the new genus and species.—*EDS. PRESS*]

Importation of Parasites.—Considering the fearful losses already occasioned to California orange-growers by two species (the *Icerya* in question and the California red scale), introduced from Australia, we know of no way in which the Department could more advantageously expend a thousand dollars than by sending an expert to Australia to study the parasites of the species there and secure the safe transport of the same to the Pacific Coast; and the fact that the Commissioner of Agriculture is prevented from doing so by restrictions imposed on the Division of Entomology is a sad commentary on the narrow Congressional policy which seeks to limit and control administrative action in details which can neither be properly understood nor anticipated by committees.

FOES OF THE COTTONY CUSHION SCALE FOUND IN CALIFORNIA.

the natural home of the *Icerya*, when it shall be settled upon, to hunt for parasites, is a good one, and we hope it will be realized. We cannot count too many natural enemies for our imported pests. The facts brought to light by the studies of Prof. Riley and his assistants with reference to predaceous insects found here are interesting, and we give them herewith, with engravings of the insects described. The following is selected from the report mentioned:

Birds.—The natural enemies of the cottony cushion scale seem to be very few in number, not only in California but also in South Africa and New Zealand. In South Africa the only bird which is recorded as feeding upon this scale is the common "white eye" (*Zosterops capensis*), and this is given by Mr. Trimen upon hearsay evidence only: "I have not noticed any of our small birds attacking the *Dortheia*, but Mr. C. B. Elliot tells me that his boys have observed the little 'white eye' * * * pecking at them." From what we have been able to learn of the habits of this bird, however, we are inclined to think that it is attracted rather by the abundant secretion of honey-dew and the minute insects caught in it than by the scale insects themselves.

Koebele and sent to us for study we may mention first the larva of a small moth (*Blastobasis iceryella* n. sp.), Fig. 1, although as yet we are not certain that it ordinarily preys upon the living and uninjured scale insects or their eggs. Like certain other so-called predaceous Lepidoptera, it may be attracted primarily by the waxy secretions of the bark lice, and only incidentally destroy the insects and their eggs.

These larvae were often found feeding in the egg masses of females which has been destroyed by soap washes, and also in sacs, the eggs of which had hatched some time previously, but never upon fresh eggs. One of the larvae, kept in a glass tube with living scales and fresh eggs, fed slightly on the waxy mass, but did not thrive until after the scales died. It then fed upon the dead scales and molted, but died before transforming. Two nearly full-grown larvae fed readily on dead scales which were still soft and passed through their transformations successfully. The same insect fed readily upon the black scale (*Lecanium olea*), in this case eating the living insects and their eggs, forming a silken tube along the twig, and passing from one scale to another, just as does the Coccid-eating *Dakrura* (*Dakrura coccidivora*) in feeding upon the cottony maple scale at the East. This is probably the same insect as that mentioned by Prof. Comstock, Annual Report Department of Agriculture, 1880, p. 336, as fol-

Breeders' Directory.

Six lines or less in this Directory at 50c per line per month.

HORSES AND CATTLE.

J. H. WHITE, Lakeville, Sonoma Co., Cal., breeder of Registered Holstein Cattle.

GEO. BEMENT & SON, Redwood City, Ayrshire Cattle Southdown Sheep, Essex Swine.

R. J. MERKLEY, Sacramento, breeder of Norman, Percheron Horses and thoroughbred Shorthorn Cattle.

BRADLEY RANCH, San Jose, Cal., breeder of recorded thoroughbred Shorthorn Cattle and Berkshire Hogs. A choice lot of young stock for sale.

M. D. HOPKINS, Petaluma, Cal. Eastern imported registered Shorthorn Bulls and Heifers for sale.

HOLSTEINS, AAGGIE, JACOB; NETHERLAND and Artis strains; all ages; largest herd to select from. Young bulls, low. (All registered.) F. H. Burke, 401 Montgomery St., S. F.

E. J. TURNER, Hollister, Breeder of Percheron-Norman registered Horses and Roadsters.

E. W. STEELE, San Luis Obispo, Cal., breeder of Thoroughbred Holstein and Jersey Cattle.

SETH COOK, Danville, "Cook Farm," Contra Costa Co., breeder of Aberdeen Angus, Galloways and Devons (Registered). Young stock for sale.

PETER SAKS & SON, Lick House, San Francisco, Cal. Importers and Breeders, for past 16 years, of every variety of Cattle, Horses, Sheep and Hogs.

WILLIAM NILES, Los Angeles, Cal. Thoroughbred Poultry, Cattle and Hogs. Write for circular.

J. R. ROSE, Lakeville, Sonoma Co., Cal., breeder of Thoroughbred Devons, Roadsters and Draft Horses.

THE BEST HERD OF JERSEYS, all A. J. C. C. registered, is owned by Henry Pierce, San Francisco.

H. W. COWELL, Stockton, "Morrano Farm," breeder and importer (and agent for Leonard Bros., Mo.) of Aberdeen and Galloways. Young stock for sale.

T. E. MILLER, Beecher, Ill. Oldest and best herd Hereford Cattle in U. S. Cattle delivered in California.

COTATE RANCH BREEDING FARM, Pages Station, S. F. & N. P. R. R. P. O., Penn's Grove, Sonoma Co., Cal. Wilfred Page, Manager. Breeders of Short Horn Cattle, English Draft Horses, Spanish Merino Sheep and Berkshire Swine.

W. J. MARSH & SON, Dayton, Nevada. Registered Shorthorns of choice bred strains.

H. van der STRATEN, Hopland P. O., Durham Valley Farm, Mendocino Co., breeder of Shorthorn Cattle (registered). Young stock for sale.

POULTRY.

MRS. M. E. NEWHALL, San Jose. White and Brown Leghorns, Langshans, Plymouth Rocks, Light Brahmas, Pekin Ducks and Bronze Turkeys.

JAS. T. BROWN, 18 Georgia St., Los Angeles, Cal. Breeder of Thoroughbred Poultry of the leading varieties. Send for circular and price list.

W. C. DAMON, Napa, \$2 each for choice Wyandottes, Leghorns, Lt. Brahmas, Houdans. Eggs, \$2.

CHOICE LAND AND WATER FOWLS for sale at all times of the most popular and profitable varieties. Please inclose stamp for new circular and price list to R. G. Head, Napa, Cal.

PIEDMONT POULTRY YARDS, J. N. Lund, Box 116, Oakland, Cal.

T. D. MORRIS, Sonoma, Cal. Toulouse and Embden Geese, Bronze and W. Holland Turkeys, and all leading varieties of Thoroughbred Poultry.

O. J. ALBEE, Lawrence, Cal., breeder and importer.

D. H. EVERETT, 1616 Larkin St., S. F., importer and breeder of Thoroughbred Langshans and Wyandottes.

AKFORD'S IMPROVED INCUBATOR.—400 eggs, \$50; 150 eggs, \$25. Guarantee satisfaction. For particulars address, I. P. Clark, Mayfield, Cal.

CALIFORNIA POULTRY FARM, Stockton, Cal.; send for illustrated and descriptive catalogue, free.

E. C. CLAPP, South Pasadena, Cal. Light Brahmas (Williams-Foot stock), Plymouth Rocks (Kieffer-Conger stock). Fowls and Eggs in season. No circulars; write for wants.

SWINE.

TYLER BEACH, San Jose, Cal., breeder of Thoroughbred Berkshire and Essex Hogs.

REGISTERED BERKSHIRES, BLACK JACK, BESS and REDWOOD imported strains; pairs and trios, not akin, at farmers' prices. Young boars, low. F. H. Burke, 401 Montgomery St. S. F.

WILLIAM NILES, Los Angeles, Cal. Thoroughbred Poland-China and Berkshire Pigs. Circulars free.

I. L. DICKINSON, Lone Oak Farm, Sonoma, Tuolumne Co., Cal., breeder of thoroughbred Essex Hogs. Pigs now ready for sale. Prices reasonable.

JOHN RIDER, Sacramento, Cal. Breeder of Thoroughbred Berkshire Swine. My stock of Hogs are all recorded in the American Berkshire Record.

SHEEP AND GOATS.

L. U. SHIPPEE, Stockton, Cal., importer and breeder of Spanish Merino Sheep, Durham Cattle, Jacks and Jennys & Berkshire Swine—high graded rams for sale.

E. W. WOOLSEY & SON, Fulton, Sonoma Co., Imp's & b'ders Thoroughbred Merino, & Jersey Cattle.

EASTON MILLS, Lakeville, Sonoma Co., thoroughbred Spanish Merino Sheep. Choice rams for sale.

A. G. STONESIFER, Hill's Ferry, Stanislaus Co., Cal., breeder of pure blooded French Merino Sheep.

J. B. HOYT, Bird's Landing, Cal., importer and breeder of Shropshire Sheep; also breeds cross-bred Merino and Shropshire Sheep. Rams for sale.

T. H. HARLAN, Williams, Colusa Co., breeder pure blooded Angora goats, & Merinos; young stock for sale.

F. BULLARD, Woodland, Cal., importer and breeder of Spanish Merino Sheep. Premium band of the State. Choice bucks and ewes for sale.

R. H. CRANE, Petaluma, Cal., breeder and importer. South Down of Long John Wentworth herd for sale.

KIRKPATRICK & WHITTAKER, Knight's Ferry, Cal., breeders of Merino Sheep. Rams for sale.

THE STATE FAIR

At SACRAMENTO, Cal., Sept. 12 to 24, 1887.

\$2000 in Cash for County Exhibits.

SPECIAL ATTENTION OF THE FARMING COMMUNITY

Is called, as well as the various Immigration Societies, Boards of Trade of the several Counties, and all others interested in bringing out the resources of their respective Counties, to the advantages offered by an Exhibition at the

STATE FAIR

Of the varied products of their counties. The supervisors of each county are invited to make a liberal appropriation, sufficient to pay the expenses of getting together an Exhibition of County Products. Premiums received can be returned to the treasury of each county making the appropriation, so that their respective counties would be written up and advertised at a small expense by an exhibition of this character. The Railroad Company transports the same free of charge.

THE LIVE STOCK EXHIBITION, connected with the State Fair, is sure to attract Eastern visitors anxious to view the resources of California.

APPLY FOR SPACE AT ONCE, as the Society is willing to devote the entire exposition building, if necessary, to displays of CALIFORNIA PRODUCTS. A NEW FEATURE has been added to the Premium List this year, in the shape of awards for a Sheaf Display of Cereals. Forty Sheaves, not less than 10 inches in diameter, of 10 varieties of grain are called for. Not necessary to be grown by exhibitor. Notice is now given that samples may be gathered during harvest, and laid away for exhibition. Address the Secretary for Premium Lists and other information.

S. H. MARKET REPORT

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, July 13, 1887.

The past week has been unusually favorable to harvest work, and farmers have not been slow in taking advantage of it. European wheat advices have reported throughout the week a firm, steady market. To-day's cables are as follows:

LONDON, July 13, 1887.—Cargoes off coast, firmer; cargoes on passage and for shipment, firmer; Mark Lane, firm, steady; Cal. wheat, just shipped, 39s. 6d.; Cal. wheat, nearly due, 39s. 6d.; Liverpool wheat, spot, firm; Liverpool wheat, Cal., 7s. 3d. to 7s. 6d.

Foreign Review.

LONDON, July 11.—The *Mark Lane Express*, in its review of the British grain trade during the past week, says: The wheat crop is making the best possible progress toward maturity, and failing disaster will be of phenomenal quality and quantity. The barley and oat crops are not much behind wheat. Beans are badly infested with aphides. Peas promise to be poor in Ireland. The trade values for wheat continue in favor of buyers, although deliveries have been small. The sales of English wheat during the week are 16,727 quarters at 34s. 2d. against 29,822 quarters at 30s. 9d. during the corresponding period of last year. Foreign wheat is weaker and business is restricted. The arrivals of wheat cargoes numbered 24; three were withdrawn and 21 remained. At to-day's market there was but little inquiry for wheat and values were unchanged. Beans were 6d. cheaper. Other articles were unchanged.

Crops at the East.

CHICAGO, July 10.—The following summary will app ar in this week's *Farmers' Review*: During the last week refreshing rains were experienced quite generally throughout the States of the Mississippi valley, though many unvisited localities suffered from drought. The winter wheat harvest is now so nearly completed as to furnish a safe basis for an estimate. The estimates of yields per acre, reached by summarizing the reports of our correspondents in this issue, are as follows: For 17 counties in Illinois, 17 bushels; 9 counties in Indiana average 15½ bushels per acre; 12 counties in Kansas give 13 bushels, which former reports incline us to think is too high; 4 counties in Kentucky average 11½ bushels; 3 counties in Michigan 13 bushels; 7 counties in Missouri average 19.7 bushels; 12 counties in Ohio, 16 bushels; and 4 counties in Wisconsin, 16½ bushels. Reports on the condition of spring wheat are uniform from Dakota, Nebraska, Minnesota, Iowa and Wisconsin. The lowest percentage of condition as compared with the average crop is 70 from Nebraska, and the highest 78 from Wisconsin. Spring wheat is rapidly approaching maturity and now, in spite of drought and insect injury, gives promise of about three-quarters of an average crop. The same condition will very nearly apply to the condition and prospective yield of oats. Corn generally is in a very promising condition and fully two weeks ahead of the season. There is already some complaint of chinchbug depredations, and there is danger that as spring wheat and oats are harvested the bugs will move in force to the adjacent cornfields, doing much injury.

Eastern Wheat Markets.

NEW YORK, July 13.—12 M.—84½¢ for cash, 83½¢ for July, 83½¢ for August, 84½¢ for September, and 85½¢ for October.

CHICAGO, July 13.—Wheat firmer; cash, 71½¢; August, 72½¢; September, 74¢.

California Products at Chicago.

CHICAGO, July 9.—In dried fruits there are no new developments and no features of interest to note. There is little demand, but the dullness does not affect prices, light stocks holding the market steady. Raisins are a little slow. Apricots to arrive are in firm request. Pitted Plums, evaporated, 10¢@11¢; sun-dried, 10½¢@10¾¢; Apricots, evaporated, spot goods, 22¢@25¢; future delivery, 15½¢@16¢; Prunes, 9¢@10¢; Raisins, London layers, 20-lb. boxes, per box, \$1.40@1.50; loose Muscatel, per box, \$1.25@1.30; California layers, \$1.25@1.30.

CHICAGO, July 12.—Trade is very good in California green fruits. Choice sound fruits are steady as follows: Apricots, half crates, \$1.50@1.75; peaches, 20-lb. boxes, \$1.75@2; peaches, Crawford, 20-lb. boxes, \$2.75@3; plums, Purple Duane, half crates, \$2.25@2.50; plums, Royal Hative, crates, \$2.25@2.50; pears, Bartlett's, \$3.50@3.75; grapes, Sweetwater, 20-lb. crates, \$2@2.50. Stock in soft order sells at less prices. Dried fruit is dull. As soon as the berry season is over, increased demand is looked for. Owing to small stocks prices remain about steady, and, taken all round, the market presents nothing new.

New York Hop Market.

NEW YORK, July 10.—There is no business, except moderate sales of 1886 Germans and Pacifics; Coast crop 1886 best, 21¢@23¢; common to choice, 16¢@20¢; 1885, good to prime, 10¢@13¢.

Eastern Wool Markets.

NEW YORK, July 10.—The wool trade continues light, partly because of warm weather and partly because of a feeling of greater caution since Western growers became a little shaky and express less confidence. The Boston market was dull, manufacturers being unwilling or unable to buy at present quotations. Among sales were: 117,000 lbs Territory at 17¢@25¢; 71,000 lbs Eastern Oregon at 17¢@18¢.

California Products in New York.

NEW YORK, July 10.—Green Fruit—California blue plums and choice apricots, 25¢ @ doz; peaches, 60, 65 cts and \$1 @ doz.

Canned—California pears, \$3@3.25.

Raisins remain unchanged.

NEW YORK, July 12.—California yellow mustard seed, 4½¢@4¾¢ cts. @ lb.

Local Markets.

BAGS—Over 2,000,000 wheat bags were added to the stock the past week, by the arrival of an overdue vessel from Calcutta. The pool, apparently, have hard work to keep values up. The market is quoted at 6¼¢@7¢ for standard size.

BARLEY—The market ruled weak and lower up to to-day, when a large buying interest started up on Call, and values recovered at the morning session 3c on buyer '87. Trading on Call has been quite active throughout the week. Receipts are very heavy, but it appears that the grain is mostly held against sales on Call. To-day's sales were as follows:

Morning Session: Buyer season—100 tons, \$1.19. Seller 1887, new—100 tons, \$1.03½; 100, \$1.04; 200, \$1.04½. Buyer 1887—200 tons, \$1.12½; 200, \$1.12½; 100, \$1.12½; 400, \$1.13½; 200, \$1.13½; 300, \$1.14; 100, \$1.14½; 100, \$1.14½; 100, \$1.14½; 300, \$1.14½; 100, \$1.14½; 200, \$1.14½; 700, \$1.15 @ ct. Afternoon session: Buyer season—100 tons, \$1.21½. Buyer 1887—300 tons, \$1.15; 800, \$1.15½; 500, \$1.15½; 500, \$1.15½; 100, \$1.15½; 200, \$1.15½; 100, \$1.15½; 300, \$1.15. Seller 1887—100 tons, \$1. Seller 1887, new—100 tons, \$1.04½; 100, \$1.04½; 100, \$1.04½ @ ct.

BUTTER—Gilt-edged butter is wanted, but off grades are pressing the market at low prices.

CHEESE—There appears to be a better demand at the lower prices, with distant points coming in as buyers. The market closed steadier.

EGGS—Strictly choice fresh-laid are wanted; other qualities are slow of sale.

FLOUR—The tone of the market appears to be firmer, owing to the strength exhibited by wheat.

WHEAT—Transactions on Call the past week were quite free, with the syndicate taking all offered. The slight decline and sharp upward moves add zest to the traffic and bring in more actual traders. It is claimed that there is a heavy short interest on the market. Contract sales of No. 1 bring more than there is of that grade of wheat in the State. To-day's sales on Call were as follows:

Morning session: Buyer 1887—100 tons, \$1.94. Seller 1887—300 tons, \$1.89; 200, \$1.88½; 200, \$1.88½; 200, \$1.88½; 300, \$1.88½; 2300, \$1.88½. July—300 tons, \$1.89; 100, \$1.89½. August—100 tons, \$1.89. July, new—100 tons, \$1.89½ per ct. Afternoon session: Seller 1887—1300 tons, \$1.88½; 700, \$1.89 per ct.

[COMMUNICATED.]

Market Information.

Cereals.

Cable advices received from England report that heavy rains fell about July 5, which did considerable good to the growing crops. Mail advices are as follows: In the United Kingdom there are reports of intense heat and very little rainfall. Rain is much needed there for the spring grain and hay crops, and the root crops. There has been a drouth in Ireland since the beginning of May. In France the reports of the growing crops indicate about an average output for wheat. The weather has been warmer, with fair amount of moisture, and the very late harvest at one time expected will not, with a continuance of favorable weather, probably be more than ten days to two weeks later than usual. The same may be said of the wheat crop in Belgium and Holland. At the latest postal advices there were serious complaints of the crops in the German empire. Hungary is from recent indications expected to have about an average wheat crop. In several portions of south Russia the prospects for the wheat crop had been impaired by drouth. Wheat exports from north Russia from the opening of navigation to the middle of June had been only a few thousand bushels against about 3,000,000 two years ago.

European dealers are still fighting against high prices, and to do this to better advantage have tools in this country to bear the market, by keeping prices down on the various produce exchanges. In this city, if such be the case, they have so far not succeeded, although aided by a leading morning paper. It can only be a question of a short time when values will begin to appreciate abroad, and high figures be reached before the close of the year. This view is taken by the best informed writers, who base the opinion on the cheapness of money and the statistical position of wheat throughout the world.

Eastern advices report the new grain coming in considerably shrunken, which deteriorates from its value, owing to its producing less gluten. The market at the East has been gradually strengthening, with the visible supply showing a marked decrease each week. Last year farmers held considerable old on the farm, but this year they have none.

Our Oregon advices report harvesting progressing favorably east of the Cascade range of mountains. The yield averages larger to the acre than last year, with the quality greatly improved. Harvesting west of the Cascades has commenced in the more month favored section, but will not become general until later on.

In this State harvesting is becoming more general. Returns coming in report the outturn both in quality and yield very irregular. There will be more shrunken grain than last year, as also more red wheat. From the tenor of present advices it is safe to claim that the standard this year will be below last year. While the standard will be lower, the yield of No. 1 white shipping will not be much if any over one-half of available surplus for export. As there is a large short interest on Call, it may bother them to fill except at very high prices.

The *Chronicle* and one or two more daily papers quote No. 1 shipping wheat at \$1.80@1.82½ per cental, while on Call large buyers stand ready to take all seller '87 wheat offered at \$1.89. So that if No. 1 wheat can be bought in the open market at say \$1.82½ the purchaser can sell it the same day on Call seller '87 at a handsome profit. Seller '87 can be delivered at any time after five days' notice to the purchaser. Such low quotations as \$1.82½ or even \$1.85 are misleading when seller '87 is as high as it is on Call.

Very heavy receipts of barley have sent the market to lower figures. Holders, as a rule, are not disposed to make much of a concession, still buyers in view of heavy receipts hold off. On Call there is a pronounced bear feeling notwithstanding the consumption has largely increased, while the crop this year is all of 125,000 tons less than last year's crop. The quality of the barley is good. Eastern advices

report a shortage this year, with the quality not up to last year. If this is correct then the East will draw quite freely of brewing from this coast.

Oats have a steady, strong tone, under moderate supplies and a good demand. Crop advices from Oregon and Puget Sound are of the most encouraging character.

Eastern advices report a steadily decreasing supply of corn, but owing to the favorable crop reports values do not appreciate. In our market corn is steady. According to the Produce Exchange the stocks on hand in this State on July 1 were as follows in centals:

	1887.	1886.
Wheat.....	2,790,400	1,232,000
Barley.....	798,500	114,820
Oats.....	42,400	31,150
Corn.....	72,330	27,625
Rye.....	1,350	1,050

Exports of wheat from India for the week ending July 2 were 1,700,000 bushels, of which 640,000 bushels were to the United Kingdom and 1,060,000 bushels to the Continent. The total shipments from January 1 to July 2 were 19,580,000 bushels, of which 9,520,000 bushels were to the United Kingdom and 10,060,000 bushels to the Continent.

The *Chicago Daily Bulletin* of July 6 says: There was a carload of No. 2 Spring wheat delivered yesterday in a bunch of 5000 bushels for July delivery, bought at 69½¢, on which the storage was 70½¢. Quantity of wheat on passage to France June 17, reported at 2,800,000 bushels, against 760,000 bushels for the corresponding date last year. Quantity of wheat on passage to Antwerp, June 17, estimated at 640,000 bushels, against 1,760,000 bushels at the corresponding date last year. Quantity of barley on passage to U. K., June 16, reported at 1,040,000 bushels, against 410,000 bushels for corresponding time in 1886.

Chicago telegrams to S. S. Floyd & Co. of this city report that crop returns have been received from every county in Illinois, and also in Indiana, which show an average yield to the acre of 13 bushels, but in Ohio the yield so far reported only averages 12 bushels to the acre.

The New York Produce Exchange *Reporter* says: The United States wheat crop of 1886 was placed at 457,218,000 bushels measure, by weight 444,777,702 bushels, 60 lbs. The quantity left over July 1, 1886, was placed at 70,000,000 bu., of which 50,000,000 bu. were considered as reserve and 20,000,000 bu. added to crop of 457,218,000 bu., making 477,218,000 bu. The home consumption for 60,000,000 population and seed are 335,000,000 bu. The exports, so far, from both coasts, have been 152,330,702 bu. in wheat and flour to all countries, making with home requirements for the year added 487,330,702 bu., which shows that the 50,000,000 bu. reserve has already been drawn upon to the extent of 5,222,700 bu. The visible supply is now about 39,350,000 bu., and includes the reserve stock. If the export movement be not disappointing, there will be a further decrease in it on July 5th, of 2,250,000 to 2,500,000 bu. The quantity in the country outside of the visible wheat is believed to be moderate. The wants of Europe are large; if consumption be normal, the United Kingdom will require from Atlantic ports about 1,000,000 bu. of wheat (flour included) per week for 11 weeks to come. The indications are that there will be no very considerable movement of the new winter wheat crop till about the 10th to 15th of August. The rainfall in the winter wheat belt has for the last three weeks been very small. At 70c to 75c for winter wheat it is not probable that farmers will be free sellers.

Mail advices received to-day from England are as follows: The weather in the United Kingdom has remained warm and summer-like, and entirely favorable for the growing crops, the progress of which is described by most of the agricultural reports as really wonderful, compared with a fortnight ago. In France the improvement in the wheat crop has been equally favorable, and now that the blooming period is passing under favorable auspices, what seemed like a small average crop a month ago will probably prove to be a full one. In Germany, although vegetation is very backward generally, there are very few complaints. In Hungary, the wheat crop, according to the latest estimate of the Minister of Agriculture, promised to be a full average on 54.9 per cent of the total area, above an average on 38.9 per cent, and below an average on 6.2 per cent. The outlook is therefore decidedly better than last year.

Feedstuff.

On last Thursday the mills advanced the price of both bran and middlings. The cause of the advance is said to be due to the shutting down of several mills for repairs, and also the increased demand. In other ground feed there are no changes to note.

This paper, early in June last, took the ground that hay will be high throughout the season; and all present indications point to this view being correct. The market is higher for all grades of new, under a good demand and strong holding.

Fruits.

Yellow Crawford peaches make a better showing, and as the price recedes the more common peaches lose favor and consequently are hard to sell even at low prices.

The better varieties of plums are coming in quite freely, but as yet they are not any too ripe, which necessitates concessions except to purchasers filling distant orders.

Pears are in good supply, but as yet they are not very choice.

Cherries are about gone and not quoted. Currants are hanging on unusually long, that is, the supply is quite large considering the length of time they have been in the market.

Raspberries are shaded to find quick custom.

Blackberries are in liberal supply, necessitating low prices to clean up large consignments.

Apricots continue to come in heavily, causing low prices to rule. The canners continue to buy freely.

Apples are improving in quality, but as yet the more choice varieties have not put in an appearance.

Strawberries are fairly steady, with canners still buying at the lower quotations.

Cantaloupes are gradually settling in price under more liberal receipts.

In dried fruits no new of this season is offering except apricots, which have a wide range, according to quality. Considerable are being shipped to the East.

Grapes are coming in more freely. The demand

is improving, owing to the quality being much better. Orders from up north are coming in for the better varieties, causing the price to rule fairly strong at the close.

Watermelons continue to come in sparingly.

Live-Stock.

The consumption of meats continues light, owing to the large number of San Franciscans absent, and also to the heavy supply of fresh fruits. Beef cattle are barely steady at quotations, although prices in the interior are reported to be well maintained. Mutton sheep are offering at shaded prices. Hogs are very scarce and wanted in small quantities. In horses there is nothing doing in draft animals, as the demand appears, for the moment, to be satisfied. Roadsters and matched teams are wanted, as are general utility horses. For these there seem to be ready buyers always at hand.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 7¢@7½¢; first grade, grass fed, 6¢@6½¢ per lb.; second grade, 6¢; third grade, 4½¢@5½¢.

LAMB—Ewes, 5¢@5½¢; wethers, 6¢@—c.

LAMB—Spring, 7¢@8¢.

VEAL—Large, 6¢@7¢; small, 6¢@8¢.

PORK—Live hogs, 4¢@5¢ for heavy and medium; hard dressed, 7¢@7½¢ per lb.; light, 4½¢@5¢; dressed, 7¢@7½¢; soft hogs, live, 3½¢@4¢. On foot, one-third less for grain or stalled, and one-half less for stock running out.

Vegetables.

Potatoes ruled easy up to Tuesday, when a steadier, stronger tone set in under a freer demand for the more choice.

Onions are fairly steady, with an improved call reported for the better matured.

Cucumbers, egg plants, green okra and peppers are in freer receipts, with buyers favor.

Tomatoes continue to hold up well. Receipts barely meet the trade call.

String beans and peas are without essential change. The quality is as a rule poor.

Green corn is coming in more freely, causing prices to shade off very materially.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.....	287,902	323,571
In port, disengaged.....	106,020	31,961
In port, engaged.....	18,416	39,101

Totals.....412,338 394,633

The above gives a carrying capacity as follows: 1887, 659,740 short tons; 1886, 631,412 short tons; increase over last year, 28,328.

The small supply of fine merino and crossbred wools causes light trading in our market. The Eastern market takes the finer grades at from 1 to 3 cts per lb higher prices than last year, but the coarser grades are slow.

In hops, holders are firm in the belief of better prices. English advices report a smaller crop this year, as do Belgium advices; but Germany and Nuremberg will have a fair average. New York advices report that the yield in that State will be one-half of the crop of 1885, which was 158,000 bales. New York advices report the brewers lightly stocked with hops.

Poultry has ruled steady and firm throughout the week.

Beans are dull and heavy, as are seeds.

Hams and bacon are advancing. Quotations are ¼¢ per lb higher, with another advance looked for soon.

Large speculative movements have been made within the past few days in canned corn, canned peas, canned peaches and canned tomatoes, which have caused prices to advance quite sharply.

San Francisco, July 13, 1887.

Fruits and Vegetables.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR THE WEEK ENDING JULY 5, 1887.

365,958.—BRIDLE BIT—H. Baldrige, Los Angeles, Cal.
365,908.—MOSAIC WORK—E. Chatain, S. F.
366,103.—EXTRACTING SILVER—O. Hofmann, Alameda, Cal.
366,007.—ROLLER ATTACHMENT FOR BOATS' GUNWALES—P. S. Katsenys, Astoria, Ogn.
366,011.—BEER COOLER—Liddicoat & Utzinger, Astoria, Ogn.
366,123.—POOL TABLE ATTACHMENT—X. Margheri, S. F.
365,930.—VERMIN ERADICATOR—Chas. Meeker, Albina, Ogn.
365,849.—POCKET-FRAME CLAMP FOR POOL TABLES—A. G. Nygard, S. F.
365,851.—BOTTLE CASE—Henry Palmer, S. F.
365,938.—BUTTON-HOLE GAGE—Deia Phillips, Los Angeles, Cal.
365,869.—BEVEL AND SQUARE—Shaw, Cutbirth & Platt, Los Angeles, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

A Woman's Age.

A woman, it is said, is no older than she looks. Many women, however, look double their actual age by reason of those functional disorders which wear upon the nerves and vitality, and which, if unchecked, are liable to change the most robust woman to a weak, broken-down invalid. Dr. Pierce's "Favorite Prescription" will positively cure every irregularity and weakness peculiar to the sex, and requires but a single trial to prove its surpassing merit. Price reduced to one dollar. By druggists.

The Nineteenth Century Club is an organization that will consist of an equal number of men and women. It is hardly to be expected that they will agree on all subjects; but it can surprise no one to learn that Dr. Pierce's "Golden Medical Discovery" is unanimously pronounced the most successful remedy extant for pulmonary consumption, as has been demonstrated in hundreds of cases; it positively arrests this disease and restores health and strength, if administered in its early stages. By druggists.

Young or middle-aged men, suffering from nervous debility or kindred affections, should address, with 10 cents in stamps, for large treatise, World's Dispensary Medical Association, 668 Main Street, Buffalo, N. Y.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

BERKSHIRE SALES.—The transcript from the last entry in the Berkshire Record, which is sent us by Phil. M. Springer, of Springfield, Ill., secretary, has the announcement of the sale of Carmelita 17,272, Vulcan, 17,273, Mollie 17,274, Major 17,275 and Hily 17,276, by Andrew Smith, Redwood City, Cal., to John G. Wright, San Francisco, Cal.

PURCHASING AGENCY.—We invite the attention of ladies in the interior to Mrs. F. E. Smith's card, which appears in another column.

For circulars and maps call on

FRISBIE & WILEY, Redding or Anderson, Shasta Co., Cal.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

NEW MEXICO STARTING A "BOOM."—A dispatch from Las Vegas states that at a meeting of the Bureau of Immigration of New Mexico, held there on the 11th, it was decided to publish a large edition of a pamphlet on New Mexico, correcting false notions of the Territory and setting forth its advantages. The pamphlet will be distributed by Secretary H. C. Barnett of Santa Fe. Only a very small portion of the Territory is covered by land grants, and fully nine-tenths of New Mexico is open to settlement. Crops are in fine condition and there has been less irrigation than any other year heretofore. Immigration is steadily increasing, and there is active dealing in real estate in the larger towns.

NEVADA STATE FAIR.—We are glad to note that our Nevada friends propose to make an unusual effort to draw out a display of their resources and achievements at the State Fair, which will be held in Reno the last week in September. Especial attention will be given to the Pavilion exhibit. Two premiums are offered for county exhibits; Washoe county being ruled out from competition for the first place because, we suppose, of its proximity. It would be a good idea to have a grand rally of Nevada people and products this year.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

DR. J. KOHNIG—Dear Sir: I have analyzed your sample
 of "Nitrogenous Superphosphate," with the
 following result:

Soluble Phosphoric Acid.....	12.90 per cent
Inverted Phosphoric Acid.....	.96 "
Insoluble Phosphoric Acid.....	2.83 "
Pota h.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85
 per cent Ammonia, therefore, total of Nitrogen calcu-
 lated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vine-
 yards, orchards, gardens, farms, and I recommend its
 use by the cultivators of the soil generally, in Cali-
 fornia. Yours truly,
 DR. E. A. SCHNEIDER.

University of California, College of Agri-
culture.

BERKELEY, Nov. 20, 1886.

DR. J. KOHNIG, San Francisco—Dear Sir: I take pleas-
 ure in adding my testimony to that of Dr. Schneider as
 to the high quality of the "Nitrogenous Super-
 phosphate" Fertilizer, analyzed by him at your re-
 quest. It is a high-grade article, and as such re-
 turns the user a better money value than a low-grade

H. M. NEWHALL & CO., Agents, 309

fertilizer. It is especially well adapted to use in
 California, on account of the predominance in
 it of Phosphoric Acid, which is generally in small
 supply in our soils. Yet it is desirable that "com-
 plete" fertilizers be used in our orchards and vineyards,
 and yours is of that character in furnishing
 Potash and Nitrogen as well. Very respectfully,
 E. W. HILGARD.

The value of this Fertilizer consists in the large per-
 centage it contains of Phosphoric Acid—the chief
 element of all plant food—in combination with the
 necessary quantities of Potash and Ammonia, and
 the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found
 sufficient: For Wheat, Barley, Corn and Oats, 300 to 350
 pounds per acre. For Grass, Sugar Beets and Vegeta-
 bles, 250 to 300 pounds per acre. For Vines, Fruit
 Trees, from 1 pound to 1 pound each. For Flower Gar-
 dens, Lawns, House Plants, etc., a light top dressing,
 applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sbranto, Station of the C. P. R. R., 20
 miles north of San Francisco, at \$30 per ton, by the

HEADQUARTERS
FOR ALL KINDS OF
BALING PRESSES
—AND—
HAYING TOOLS.

THE MONARCH, JR., HAY PRESS.

IMPROVED FOR 1887.

Any young man can earn more on an investment of \$500 in this press than can be earned in expending \$2000 for any other machine. We have a Monarch Press, which we sell for \$600, but has been used a very little and is just as good as new, which we will sell for \$450.

THE CLIMAX HAY PRESS, \$300.

Weight, 2200 lbs. A crew of three men—four can be used to advantage.

Five ropes are used on the bales. Capacity, 10 to 15 tons per day. The best press for the money in the world.

The Celebrated Petaluma Baling Press.

Weight, 2600 lbs. Price, \$350, delivered at the factory. Size of bale, 22x22x48 inches. Capacity, 26 tons per day. Weight of bale from 225 to 400 lbs. This remarkable machine still stands at the head of all vertical baling presses, and probably bales three-quarters of all the hay west of the Rocky Mountains.

Whitman's IMPROVED New Rebound Plunger.

GREATLY IMPROVED FOR 1887.

Do not confound our New Press with that made two years since. EVERY PRESS FULLY WARRANTED. For one or two horses. The most powerful in use. The most rapid and durable, and the most perfect. Makes the most perfect bale. The most simple to operate. Least expense for repairs. NO STOPS FOR TYING BALE.

The Greatest Success of the Age.

Victorious in every contest. Double-acting, with new concentrating power. Do not buy a Press until you have seen the Improved New Whitman with concentrating power. Puts from 10 to 15 Tons in a Car.

16x18 Mounted, weight, 3600 lbs. \$400 00
16x22 Mounted, weight, 3300 lbs. 450 00
All make bales of variable size.

Hay Forks, Hay Carriers, Harpoon Forks, and all kinds of Haying Tools in great variety. In baling your hay, use our Steel Baling Ties. Cheaper than Wire—Better than Rope.

TRUMAN, ISHAM & HOOKER,

421—427 Market Street, San Francisco.

THE BUYERS' GUIDE is issued Sept. and March, each year. 312 pages, 8 1/2 x 11 1/2 inches, with over 3,500 illustrations—a whole Picture Gallery. GIVES Wholesale Prices direct to consumers on all goods for personal or family use. Tells how to order, and gives exact cost of everything you use, eat, drink, wear, or have fun with. These INVALUABLE BOOKS contain information gleaned from the markets of the world. We will mail a copy FREE to any address upon receipt of 10 cts. to defray expense of mailing. Let us hear from you. Respectfully,
MONTGOMERY WARD & CO

HAY PRESSES.

We, the PRICE HAY PRESS COMPANY, manufacture, at San Leandro, Cal., the following Baling Presses under the immediate supervision of

OUR SUPERINTENDENT, JACOB PRICE, who is the sole Inventor and Patentee thereof, and who has been continuously engaged in the manufacture of Baling Presses for 25 years.

For Hay.

The Hurricane (see cut above), size A. \$1000
The Hurricane (see cut above), size B. 1000
The Monarch, greatly improved. 600
The Junior Monarch, improved. 500
The Genuine Price Petaluma. 350
The Climax. 300
The Improved Eagle. 250

For Wool.

The Monarch. From \$500 to \$2000

For Hides.

The Eclipse. \$500

The above Hay Presses range in capacity from 10 to 40 tons per day, and some of them make (according to size) either the common or the compressed bale. There is nothing in the United States approaching our Hurricane and Junior Monarch for speed or excellence of work. Send for large Illustrated Catalogue to

PRICE HAY PRESS CO.

SAN LEANDRO, CAL.

Worth's Patent Combined Screw and Toggle Lever Wine and Cider Press.

First Premium awarded on Wine Press at Sonoma and Marin Agricultural Fair, Sonoma Agricultural Park Association, Santa Clara Valley Agricultural Society and Mechanics' Institute, S. F.

I desire to call the attention of wine and cider makers to my Improved Press. The following has a movement of 26 1/2 inches, the first revolution of the screw moves the follower 1 1/2 ins., the last revolution is but 1-16 of an inch, thereby the power increases in the same ratio as the resistance. The platform is 50 inches wide and 10 feet long; is run back and forth under the press on a railroad track.

Has two baskets, by which you can fill the second basket while the first one is under the press, thereby doing double the amount of work that can be done on any screw or lever press in the market that use only one basket, for this reason: While my press is working continuously the other kinds are doing nothing during the time they are emptying and filling their basket.

Printed Testimonials can be had on application of the following parties, who have bought my press: J. B. J. Portal, San Jose; Wm. Pfeffer, Guberville; Joseph Walker, Windsor; Kate F. Warfield, Glen Ellen; Joseph Drummond, Glen Ellen; Isaac De Turk, Santa Rosa; John Hinkelman, Fulton; J. & F. Muller, Windsor; R. C. A Decision on Levees.

A case has just been decided by the Supreme Court of this State which affirms the right of individuals or corporations to build levees along the banks of water-courses, even though there may be indirect injury to certain low-lying lands. The action was brought to abate and remove as a public nuisance a levee erected by defendant along the west bank of the Sacramento river and across a place on said bank called "Wilkins' Slough," and to recover damages for the overflowing of plaintiff's land on the other side of the river, about two miles below, alleged to have been caused by said levee. The action came to the Supreme Court on appeal from a lower court, which gave judgment for defendant, and the Supreme Court affirms this judgment.

The decision is of considerable length, and describes all the conditions existing. It is not necessary for us to recite them. It may be remarked, however, that the court reviewed the legality of levees, and held that to grant the prayer of the appellant would be to condemn all levees which have been built from time immemorial along the banks of streams. It holds if the levee on Wilkins' slough be declared a nuisance, then the levees in front of the cities of Colusa and Sacramento, which preserve millions worth of property, including the Capitol buildings and grounds of the State, can be removed at the suit of any owner who will not protect himself, and who can show that the swell of the river is increased in times of flood by levees either above or below him, and the whole system of reclamation can be defeated. On the other hand, the building of levees has the sanction of law, in fact that the State may not only control and levee its banks for the purpose of preventing the adjoining country from overflow, but may compel riparian owners to maintain such levees at their own expense. This being the case, the defendant whose lands are injured by water which is indirectly brought upon them, must find his relief in leveeing also.

The counsel for the appellant argued that the doctrine that one land-owner on a water-course cannot dam it so as to flood the land of his neighbor above. But the court holds that appellant is not a riparian owner upon Wilkins' slough. His land is two miles away, and divided from it by a large navigable river. He has no interest in whatever rights land-owners on Wilkins' slough—if there were any—might have as between themselves. It holds also that Wilkins' slough—as between appellant and respondent at least—is not to be treated as a watercourse within the legal meaning of that word. It is simply a conduit by which, occasionally, some of the flood-water of the river escapes into the lower lands adjoining. This same office is performed by every other low place along the bank; and every other part of the levee could be removed as a nuisance if that part of it which is at Wilkins' slough can be so removed.

PURIFYING THE FAIR GROUNDS.—It is good to note how the sentiment in favor of ruling out the immoral element from our fair-grounds, and making them thoroughly decent, gains headway from year to year. In different parts of Sonoma county petitions have already been circulated asking the managers of the Petaluma and Santa Rosa Fairs not to permit any intoxi-

CALIFORNIA SILK.—A quantity of silk, reeled at the filature of State Board, was lately sent to R. & H. Simon, silk manufacturers at Union Hill, N. J., to be made into flags, and the firm writes Mrs. Rienzi, the secretary, as follows: "Of the California silk, the material of which your flags are made, we have this to say, that nothing better in raw silk exists to our knowl-

The Smyrna Fig Problem.

Will it not be sad if we have to look upon the "genuine Smyrna fig" as an *ignis fatuus* which has shone before the eyes of our horticulturists for years, and impelled to great expenditure and adventure for naught? We have had figs from Smyrna in numbers difficult to count, and yet we have believed, unless recent enterprises yield it, that we had not yet secured the true Smyrna fig, which looks so fine in dried form and sells so well. We have given the wily Asiatics credit for wonderful insight and cunning in foiling every effort put forth by California-Yankee ingenuity to seize and bear hence the priceless variety which makes their town famous the world around. We have thought they guarded their treasure with individual and Governmental skill and prowess, and we had only a few weeks ago an account of how the latest California argonaut, seeking the golden fig, had to steal aboard ship at night to save his bacon and the fig cuttings he had obtained by bribing even the faithful. All these things seem strange when we are told by the horticulturists of the Department of Agriculture that there is really no genuine Smyrna fig, but that figs in Smyrna are "like oranges in Florida, consisting of many varieties, but seldom true to name." We half believed as much, and we mistrusted that the Smyrnans were sharp enough to supply us with such nondescript varieties whenever we sought to obtain cuttings of them; but now we are told further "that from previous importations of Smyrna figs nothing more satisfactory could be obtained from there than what is to be found now in California." We are not sure of that, for there is reason to believe that some of our more recent acquisitions may prove better than we have had before, in fact some growers are sure that we have secured the prize.

The history of our fight for the fig will be interesting, and we are not desirous that it should end. If we fight for better varieties and for better ways of treating the fruit they bear, we shall yet accomplish with the fig what we have done with the raisin, the prune and other fruits—that is, produce the very best. This being so, we are glad that still further introductions are to be made, for Col. Colman, Commissioner of Agriculture, writes to Mr. Lawson that the Department will be able to send to Professor Hilgard of the Agricultural Department at Berkeley, by next November, several fig cuttings of an excellent variety, and will be pleased to do so.

These cuttings will no doubt be first multiplied as much as possible and then offered for trial to any one who still cries *excelsior* with the fig.

A FIRE in the business portion of Hanford, on the 12th, destroyed property to the value of \$150,000.

FURTHER disasters by earthquake are reported from the Mexican State of Sonora.

PROF. C. V. RILEY, U. S. ENTOMOLOGIST.—See page 65.

cating drinks to be sold on the grounds during the progress of the fairs; and at a recent meeting of directors of the Sixth District Association, it was voted, on motion of L. J. Rose, that hereafter no gambling games be allowed at fairs, and that auction and "Paris mutual" pools be sold only at a special stand 100 feet from the grand stand. This decision causes great consternation among gamblers, who have always reaped a rich harvest on such occasions.

In strength, luster and touch, it compares favorably with the best products of Europe and Asia."

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Let California Try Quinoa and Coca.

EDITORS PRESS:—A plant that should have a trial in the agriculture of California is the quinoa (*Chenopodium quinoa*), a cereal indigenous in the higher districts of Peru, and extensively cultivated there before and since the Spanish conquest. The grain prepared for the table in various ways similar to the methods of cooking beans, is regarded by the Peruvians and by many travelers as a delicacy. It was tried in Germany on a small scale and was cultivated with success, but did not give satisfaction on the table. Tschudi, from whose book of travels in Peru I learn these facts, says: "It is to be hoped that the cultivation of the quinoa will become general in Europe, for the plant would be of great utility in districts where the potato rot prevails. We all know that potatoes and tea when first introduced in Europe were found very offensive to the palate by many people who afterward accepted them gratefully. Like them, there is reason to believe that quinoa will become an article of food consumed by many civilized nations."

To the potatoes and tea may be added the tomato and maize. Within my own recollection, there was a strong prejudice among many people in Ohio against the tomato. It was avoided by them as poisonous, and when proved to be edible it was denounced as nauseous. Hominy, green maize and maize cakes are now considered in parts of Europe to be unfit to be eaten except in periods of famine. The German verdict against quinoa should not be accepted as final. Let California give it a trial.

Another Peruvian plant that deserves the consideration of enterprising farmers in a climate which, like ours, is favorable to every vegetable of the temperate zone, is the coca (*Erythroxylon coca*) which has recently become prominent in medicine. Tschudi says:

"The Indians assert that coca is the best remedy for that difficulty of breathing felt at great elevations; and my own experience agrees with their statement. While I was in the high mountains, 14,000 feet above the sea, when about starting out to hunt, I always drank a strong infusion of coca leaves. Then I could climb all day after the game without more trouble of respiration than I would have had on the lowlands. Neither did I feel any such cerebral excitement as is common among Europeans who drink coca. Perhaps this was because I drank it only in the cold Para, where the nerves are less susceptible than near the sea. But after taking the coca, I felt no desire to eat at the ordinary mealtime; it seemed to postpone my hunger."

Tschudi elsewhere says that coca is in the highest degree nutritious, and that numerous Indians have reached great age, several more than 130 years, though using coca regularly every day after the age of ten. He admits that its excessive use in mastication has an injurious effect on the human system; but he does not say anything of injurious effect upon the senses of smell and taste, which, according to a letter recently published in a New York journal, are entirely destroyed by the frequent use of coca.

JOHN S. HITTALL.

[The quinoa plant has been growing on the Experimental Grounds of the University for several years, and seed has been offered in the annual distributions of the University. Seed can be had this fall by all who would like to try the plant. At Berkeley the plant has been injured somewhat by the larva of a fly which mines between the upper and lower epidermis of the leaves. Perhaps in colder parts of the State this fly would not flourish. We should like to have fuller trial given to a plant which is as useful as Mr. Hittell shows in his letter.]

The Elephant Potatoes.

EDITORS PRESS:—I would like to know if you or your readers know anything of the Elephant potatoes. They were sent out a few years ago by the San Francisco Bulletin, and with us have proved to be the most delicious of their kind, but land suitable for them we did not have, and the few we could raise were so very good most of them had to be eaten. This year's crop is now harvested, and consists of two and one half sacks. Most of them will be kept for seed, unless after inquiry others are found to have them in plenty. Inquiry among the potato sharps at some of the San Francisco commission houses failed to discover them. They seem to be an early kind, but are good keepers. The seed of this crop was kept from June to the following April with no trouble. A dodge that is new to the writer was accomplished by taking the sprouts to plant. They yielded a good crop of small Elephants.

CAPITAL PUNISHMENT BY ELECTRICITY.—The Senate of Pennsylvania has passed a bill providing for the infliction of capital punishment by electricity. There are several devices in existence designed for such work.

THE GARDEN.

Treatment for Potato and Tomato Diseases.

Hon. N. J. Colman, Commissioner of Agriculture, sends us the following copy of a circular prepared by F. Lamson Scribner, Chief of the Section of Vegetable Pathology, concerning treatment for potatoes and tomatoes affected by blight and rot:

In Circular No. 3 of this Section, addressed to the vineyardists of the country, it was suggested that some of the preparations therein described might be found useful in preventing potato "blight" and "rot," this suggestion being made upon the knowledge of the fact that the fungus which causes the mildew of the vine is very similar in character to that which produces the diseases named above. The published evidence of experiments made in France in 1886, in the treatment of potatoes and tomatoes for "blight" and "rot" with the Bordeaux mixture, gives additional weight to this subject and renders it highly probable that by the application of preparations containing sulphate of copper we will be able to prevent, or at least to greatly diminish, the ravages of one of the worst enemies of the American farmer.

Directions for the preparation and application of the remedies thought most likely to prove successful are here presented, and it is earnestly recommended that they be given a thorough trial in order to demonstrate their supposed value.

Liquids.

(1.) *Eau Celeste, blue water* (the "Andou-naud process")—Dissolve one pound of sulphate of copper in 3 or 4 gallons of warm water. When completely dissolved and the water has cooled, add 1½ pints of commercial liquid ammonia, then dilute to 22 gallons. The concentrated liquid should be kept in a keg or some wooden vessel and diluted when required for use. Apply in clear weather with a suitable force pump having a fine spraying nozzle, which will spray the plants thoroughly but not drench them. Make the first application when the plants are in bloom, the second a week or ten days later, and, if the weather be such as will favor the development of "rot," a third and perhaps a fourth application should follow within about the same intervals.

(2.) *Copper Mixture of Gironde, Bordeaux Mixture*—Dissolve 4 pounds of sulphate of copper in 16 gallons of water; in another vessel slake 4 pounds of lime in 6 gallons of water. When the latter mixture has cooled, it is slowly poured into the copper solution, care being taken to mix the fluids thoroughly by constant stirring. It is well to have this compound prepared some days before it is required for use. (The sulphate of copper ought to be purchased in a powdered state, as it dissolves with difficulty in the ordinary crystalline form.)

This liquid, slightly thickened because of the lime, may be applied with small brooms or whisks made of slender twigs, which are dipped into the compound and then switched over the plants so as to thoroughly spray the leaves. This method is wasteful and tedious, however, and where one has a considerable area to cover, it would be economy to procure a spraying pump. The essential features of a good machine are ease and rapidity of application with economy of material.

Follow the same general directions in making the applications as are given under No. 1.

Powders.

(3.) *Sulphatine* (the Estève process)—Mix 2 pounds of anhydrous sulphate of copper with 20 pounds of flowers of sulphur and 10 pounds of air-slaked lime.

(4.) *Blight Powder*—Mix 3 pounds of anhydrous sulphate of copper with 97 pounds of flowers of sulphur. This amount will be sufficient for one application to five acres of potato plants.

Powders possess the advantage over the liquid remedies of requiring less labor in transportation and of being more easy of application; consequently they will be preferred to the liquids should they prove equally efficacious.

For applying the powders, which ought to be done when there is no wind and when the leaves are wet with dew or rain, the primitive arrangement, made of tin and constructed like a large pepper-box, or rather like an inverted funnel with fine wire gauze fastened over the lower end, and which, when filled with the powder, is held over the plants and shaken, is efficient and at the same time simple and inexpensive. Only enough of the powders, especially of the sulphatine, should be applied to be simply visible upon the leaves, as heavy doses may burn them.

Owing to the continual motion of the leaves of potato and tomato plants, by which both surfaces are liable to receive the spores of the fungus, the applications ought to cover both sides. This can best be accomplished by the use of a bellows with an extension nozzle, enabling the operator to direct the blast.

The degree of success attending the use of these compounds will depend, more or less, (1) upon their careful preparation, (2) the time of application, (3) the more or less intelligent manner in which they are applied, (4) the atmospheric condition existing at the time or which may follow the applications, (5) the

number of treatments made, and (6) the purity of the lime and sulphate of copper used.

The following observations are essentially the same as those recently published by the French Minister of Agriculture, in circular of similar import to this:

The experiments should be conducted in such a manner that the vines or plants treated and those left untreated (to serve as control experiments) may be comparable; they ought to be of the same variety, cultivated at the same time and in all respects alike. The digging of the treated and untreated plants ought to be made simultaneously, for it has been proven that the tubers may be infected at the moment when they are taken from the ground, and that the chances of infection are much greater in the early morning when the air and ground are damp than later in the day when there is less moisture.

At the moment of digging, count the rotten tubers found in the soil and also those which are spotted only. The weights of the crops from the treated plants and from those not treated should be determined, and they should be preserved separately during the winter but under identical conditions, for the purpose of learning if there be any difference between them in respect to infection.

Much may be accomplished in the prevention of potato rot by renewal of seed, selection of varieties, and especially by planting only in light and well-drained soils; also, perhaps, by following certain systems of cultivation. But the evidences we have of the serious losses occasioned by this disease throughout the potato-growing regions of the United States render it imperative on the part of the Government to exercise all possible efforts for its prevention, and I respectfully recommend the immediate distribution of this circular, urging those who suffer directly from the ravages of the diseases named to experiment with the remedies and report to you the results obtained.

HORTICULTURE.

The Apricot in the Upper San Joaquin.

EDITORS PRESS:—Judge W. C. Blackwood, in his essay read before the State Horticultural Society at its last meeting, is very much in error in some of his statements in regard to the culture of the apricot in California. He thinks the soil and climate of the coast counties better adapted to its growth than are those of the interior. My experience by practical experiments and close observation in this State, reaching over a period of about 30 years, leads me to conclusions quite reverse. Having been engaged in horticulture most of this time, I have had ample opportunities for observing and experimenting with the apricot, both in the north and south coast counties and in the counties of the interior of this State. I do not hesitate to say, without fear of successful contradiction, that there is no part of this State where the apricot grows to so large a size, attains so fine a flavor and is so good a producer as in the Upper San Joaquin.

It is an indisputable fact that the damp seafogs of the coast counties during the ripening season materially injure the flavor of the fruit, particularly in Los Angeles county, where the fogs are often very heavy and continuous. The apricot requires a dry atmosphere and but little irrigation. Artificial irrigation, if properly conducted, does not develop the gum or any other disease, as Mr. Blackwood says it does. A single case of injury has never been known in the Lucern valley, or so far as I know in any other part of the Upper San Joaquin.

The soil of the Lucern valley is of a peculiar porous character which permits of a perfect system of irrigation without flooding in a single instance. Ditches running water 200 yards apart will furnish an apricot orchard all the moisture it requires.

I have never known a healthy apricot tree in the Lucern valley to become diseased and die from any cause; the scale-bug will attack any other kind of fruit tree there before it will an apricot.

For the last four years three-fourths of the apricots handled in the Los Angeles city markets are shipped from Visalia. To gain some idea of how my orchard was producing this year, I weighed the product from five trees 10 years old and planted 22 feet apart. They yielded 3780 pounds with at least 700 pounds wasted in different ways, as from getting too ripe, etc. It is but fair to say that this is about an average yield. Two of the trees were Moorpark, two Peach, and one of the Royal variety.

In respect to varieties, Mr. Blackwood speaks favorably of the Royal and discouragingly of the Peach. In this country the Peach apricot grows to twice the size of the Royal, is of just as good a flavor, is just as good a producer, and it thins itself while the Royal does not. The Peach apricot is upon the whole the best variety cultivated in the State or in the interior; at least it does the best.

It seems to me that our leading horticulturists of the Bay counties are not informed as they should be regarding the advantages of the Upper San Joaquin for fruit-growing, and I would recommend that they give us a call when convenient and see what we are doing. F. H. JEWETT.

THE APIARY.

Experiments with Bee Forage.

One of the works of the apiarian connected with the U. S. Division of Entomology has been an investigation of the fitness of various plants for bee forage. Though it is not at all likely that all the plants found valuable by Eastern bee-keepers will succeed here, it will be interesting to our apiarists to know what their Eastern compeers are doing in the line of providing pasturage for their bees. From the forthcoming report we therefore make the following extracts:

If excellence in the bee is the chief factor in successful honey-producing, next in logical order is abundant, persistent and cheap bee pasturage. Abundant pasturage is the amount necessary to satisfy the requirements of the number of colonies kept within a given area. Persistent pasturage is that which contemplates a variety of perennial honey-bearing flora of hardy constitution and rugged habits, whose terms of blooming follow each other in succession continuously from early spring to late fall, thus lengthening out the season in which bees may gather surplus honey. Cheap bee pasturage may be such as is furnished from natural sources produced in forests or by self-propagating plants growing in waste places, or upon lands of little value, and requiring little or no labor. Or, cheap bee pasturage may be secured by cultivating fruit and field crops, the blossoms of which are valuable for honey-bearing.

As the forests of the country disappear, and the waste lands are being reclaimed, as the necessity for other honey-producing resources is felt, as the industry assumes more importance, and as the influence of competition is more sharply felt, great interest is shown in the subject of bee pasturage. Enforced idleness and the consequent waste of time, stores and energies sometimes result from a failure of the flowers to secrete nectar, even though the honey-bearing flowers are blooming in abundance; but usually the reason why the time is so short in which bees are able to store surplus honey is the lack of abundant pasturage. I have not had the time or the means to devote to bee forage that the importance of the subject demands, but I have made a beginning in this department of experimental work which I hope to continue.

Among all the trees and shrubs which are cultivated generally throughout the United States by fruit-growers, the raspberry is commonly conceded to possess more value to bee-keepers than any other. A quarter of a mile from this station a market-gardener has four acres of raspberries. These bushes continued to bloom for 10 days, and during that time, with the exception of two or three rainy days, a continuous procession of bees could be observed going and returning to and from the apiary, and a fine showing of honey was made in the hives, and the honey was of superior quality.

On account of the superior quality of its nectar, the ease with which the plant is propagated, its adaptation to all kinds of soil, and its value as a forage plant for grazing, white clover has, until of late years, stood without a rival in the estimation of honey-producers. About 20 years ago, Alsike, or Swedish clover, was introduced into this country, and since then has been thoroughly tested both as a honey plant and also for hay and pasture for all kinds of stock.

Mr. J. M. Hicks of Indiana says: "Alsike clover has no superior as a honey-producing plant, yielding the best and richest honey known, and as a hay crop it is not surpassed, often producing three tons of good hay per acre. The stems and stalks are much finer than those of common red clover, and cattle, horses and sheep feast on it, eating it clean without waste. As a pasture for all kinds of stock it has no equal. It will grow on all kinds of land, clay or sandy, and does not freeze out as easily as red clover. It is quite similar to red clover in appearance. The first crop each season is the seed crop. The seed is about one-third the size of red clover, and four pounds is sufficient to sow an acre. The bloom is a beautiful pale pink color. I have no hesitancy in saying that Alsike clover will produce 500 pounds of the richest and best honey per acre in a good season. I would recommend every bee-keeper to sow at least a few acres of Alsike clover."

Mr. W. Z. Hutchinson of Michigan says that it will pay to raise Alsike clover for honey alone upon land worth \$50 per acre.

Mr. C. M. Goodspeed says: "I have grown Alsike clover on my farm, and watched its habits closely. It is very hardy, of extra quality of hay, and a heavy seeder, reaching in rare cases 10 bushels per acre. In this locality the second growth seldom yields much honey, but the first growth just 'swarms with bees' for about three weeks, or from the time the rich blossoms open until the seed is ripe. In my locality it begins to yield honey shortly after white clover, and continues well into the basswood season. It yields twice as much honey as white or red clover."

Mr. D. A. Jones of Canada says: "I think too much can scarcely be said of Alsike clover as a hay and honey crop, and many of our

farmers are waking up to the fact that it is to their interest to cultivate it largely in preference to almost any other crop. Red clover will soon be a thing of the past, as Alsike clover-seed is now in great demand, not only for seeding purposes, but also for use in dyeing. I am informed that large quantities are being shipped to Europe for that use."

Mr. A. I. Root of Ohio, and Mr. L. C. Root of New York, both speak of Alsike clover as the most valuable variety of clover for hay and pasturage, and recommend its cultivation as being of the first importance to bee-keepers. Statements testifying to the unequalled value of Alsike clover, both for hay and grazing purposes, and as a most valuable honey plant, might be indefinitely multiplied. I cannot too strongly urge the bee-keepers of the United States to provide abundance of this forage for their bees, both by sowing the seed on their own premises and also by inducing their neighbors to cultivate this variety of clover as the best for all purposes.

Sweet clover (*Melilotus alba*) abounds in this locality. This is a hardy plant of wondrous persistence, continuing in bloom from about July 1st until killed by frost. It is adapted to almost any kind of soil. In this part of Illinois it grows in rich soil by the wayside or in deserted stone quarries with equal luxuriance. As the plant will grow without any cultivation in byways and waste places, wherever the seed can obtain a foothold, and is a perennial, it is rightly reckoned among the number of excellent and cheap bee-forage plants.

Sweet clover will endure drouth well. During the long drouth of last season, bees in this neighborhood would have been entirely without resources for many weeks together had it not been for sweet clover. The quality of the honey is excellent, and under ordinary conditions the yield is altogether satisfactory. Much apprehension has been felt among farmers lest it become a noxious weed. Observing how readily the seed is carried in the mud on wagon-wheels and horses' feet in the spring, when the roads are bad, and the entire space in the highways is used for travel, belief has obtained that the fields will soon be invaded. Careful and continuous observation of the facts for five years past has convinced me that fears of trouble from this source are groundless. In but one instance have I seen sweet clover invade a plowed field, and that was for a distance of three rods on both sides of an old road leading into the field, and the seed had been carried in on wagon-wheels. This plant, being a biennial, is easily exterminated when desirable. I would recommend bee-keepers to provide an abundance of this forage by scattering the seed in waste places and by the roadside. Sweet clover is much more sightly and useful, and less objectionable in every way, than the weeds which ordinarily cover the roadsides.

Pleurisy-root (*Asclepias tuberosa*) is a honey-bearing plant indigenous to nearly all parts of the United States, but its growth has not been encouraged for the reason that its value to the honey-producer has not been generally known. The plant is a perennial; the top dies and rots, a new growth springing up each year. It is commonly regarded as a harmless prairie-weed. The deep, red blossoms hang in clusters. The plant is very hardy, and of a rugged growth, growing luxuriantly in all kinds of soil. The honey is of the finest quality both as to color and flavor. Mr. James Heddon of Michigan, speaking of pleurisy-root, says:

"If there is any plant to the growing of which good land may be exclusively developed for the sole purpose of honey production, I think it is this; I would rather have one acre of it than three of sweet clover. It blooms through July and the first half of August, and bees never desert pleurisy for basswood or anything else. The blossoms always look bright and fresh, and yield honey continuously in wet and dry weather. Bees work on it in the rain, and during the excessive drouth of the past season it did not cease to secrete nectar in abundance." I have had some observation and experience with the plant, and, having secured seed, I expect to test it in different kinds of soil next season.

For two years past I have cultivated a plot of motherwort (*Leonurus cardiaca*) and I prize it highly as a honey plant. Bees work on it continually all day, and every day, unless it is raining quite hard. The summer of 1885 it continued in bloom six weeks. Last summer it bloomed, but was soon ruined by drouth.

At the annual meeting of the North American Bee-Keepers' Society, held at Detroit in December, 1885, a committee, of which I was a member, was appointed by the association to investigate the merits of a new plant being cultivated by Mr. Chapman of New York, who was present and represented that the plant was of unusual value to honey-producers. Being instructed by you so to do, I met with other members of that committee on July 28th, and our report was published.

Bee-Farming in South Africa.

The Cape Times of May 20th has the following interesting paragraph: The success which attends bee-farming in South Africa is affirmed by Mr. H. Lawrence, one of the largest bee-farmers in Natal, who is now on a visit to Cape Town for the sake of his health. In Natal this industry is being carried on on a somewhat large scale, and that, too, Mr. Lawrence assures us, with very remunerative results. This gen-

tleman has had very large experience in bee-farming in California, Australia and Natal, and upon that experience he states distinctly that no better climate than that of South Africa could be desired for the successful prosecution of this industry. Owning over 260 hives of bees in Natal, Mr. Lawrence states that all the year through the yield of honey per swarm is eight bottles per month. This yield he considers would be maintained in the Cape Colony during the summer months, but that in the winter it would be about half that amount. All the honey produced by him is sold to a Natal firm at the rate of 9d. per bottle, and it is then shipped to Europe, where it is resold at the rate of some two shillings. The industry can be instituted at a very trifling cost, and can be kept up without much expense, for, as Mr. Lawrence points out, there is in this climate no expenditure required for the feeding of the bees. The hives used by him are the American patent reversible, and the honey is subsequently extracted by a process which leaves the comb intact, and thus admits of its being replaced in the hives for repletion of the cells. Mr. Lawrence expresses his surprise that, with conditions so favorable, this industry has not been undertaken on a large scale in the Cape Colony, where he is assured that it could be carried on at a considerable remuneration. He is quite prepared to afford gratuitously any information and advice in his power to those who might desire to give the matter a trial, and to explain everything requisite for starting a bee-farm. What Mr. Lawrence states he would like to see ultimately brought to pass would be a very general extension of the bee culture throughout South Africa, so that finally the producers might effect a combination in order to export their honey direct, and thus reap the full benefits derivable from this industry.

THE DAIRY.

How Good Butter is Spoiled.

The Dairy and Food Commissioners of Ohio in a recently issued circular say: "Our Commission firmly believe that a large majority of the butter made by farmers is good butter, but is ruined when transferred to the dealers' hands and is done in this manner: It is received mostly in country stores and placed in filthy, frowy, rancid boxes or places and stored in cellars thoroughly impregnated with vicious odors of rotten potatoes, coal oil, fish brine, pork brine, and every other foul odor that comes from decayed vegetables kept for sale at such stores. Genuine butter will lose all its good flavor in a very few hours if put in any such place.

"But the next fatal step of the dealer is to take all varieties of colored butter and rework them together, mixing and crushing until he secures an even color.

"He then packs his mass of salve into tubs or firkins. It is no longer butter, the granulation of butter being all spoiled by this second and unnecessary working, which leaves simply grease as the result. In this ruined condition it reaches the consumer through the city commission-houses, and, of course, is pronounced unfit for table use, and possibly for cooking purposes. How can this be remedied? In two ways. The consumer must purchase direct from the farmer in suitable sized packages, so that no second working need be made, or the dealer must reform. No dealer should buy butter of the farmer unless it is put in convenient sized shipping packages when made, and in amounts of 10 to 50 pounds each, according to size of dairy, and unless it is at all times good, fresh, sweet butter; and no more roll butter should be received than the retail market demands. This is practical, and the entire make of butter can be brought to these terms.

"Next, no dealer should handle a pound of butter until he first secures a room to keep it separate from all other goods having any unpleasant odor. A cheap up-ground, artificial cellar is best, where the air is pure and well ventilated but can be kept cool.

"Roll butter should be kept on earthen plates, and these should be scalded and kept sweet and clean all the time. Any merchant who will handle butter in this manner need never lose one cent, nor will any consignment sent to reliable city dealers as packed by the farmers, fail to bring the full fair market price. Nor will consumers ever complain. The shade or color is not so material as to have good, fresh, sweet butter."

Clothilde Since Her Victory.

EDITORS PRESS:—Your readers will doubtless be interested to know how the Holstein-Friesian cow Clothilde has deported herself since she won the sweepstakes butter prize at the New York Cattle and Dairy Show.

On May 6th, eight days after calving, she was shipped to the show and was on the cars two days and nights. After being in the showing on Tuesday, her butter test was commenced the same evening, May 10th. Her milk record for the 24 hours was 63 pounds 1½ ounces, and her butter record 2 pounds 7½ ounces, thus giving her the prize.

Returning home, we shipped our cattle at New York on May 16th, and in 24 hours on cars she gave 82 pounds 4 ounces of milk. Her

yield continued increasing until May 31st, when she gave in one day in three milkings 101 pounds 2 ounces. Since then she has given in one day 100 pounds 6 ounces. Two days ago she completed a week's test for butter. During the seven days of the test she gave 665 pounds 14 ounces of milk, or an average of 95 pounds 2 ounces per day. From this milk was churned 28 pounds 2½ ounces of butter, 23.66 pounds of milk making a pound of butter. During the week she was in heat and was bred to Netherland Prince. She ate about 12 pounds of grain per day, consisting of two parts of cornmeal, two parts wheat-bran, one part ground oats, with a little oilmeal. She had good pasture, a little green rye when she would eat it, and plenty of pure water—nothing more.

SMITHS, POWELL & LAMB.

Syracuse, N. Y.

Apples for Dairy Stock.

We have a good many poor apples in this State at present, owing to the inroads of the codlin moth, and possibly some of our readers may be thinking of their food value for farm stock. The Boston Ploughman recently gave a review of the subject, from which we take the following: The feeding value of apples is not large, in Prof. Arnold's opinion. He classes them with mangels, turnips, cabbage, and the like. Their food properties are mostly carbohydrates, or heat producing, their protein being only about one-half of one per cent, and their nutritive ratio about 1 to 30; and hence they are most effective when fed with more nitrogenous food, like clover, though they may be fed sparingly with grass. They have a higher value than is indicated by the weight of their food constituents, on account of condimental qualities and from having a large per cent of those constituents in a condition to be at once absorbed and appropriated without waiting for any special action of the stomach.

If hay be used as the unit of measure, apples compare with it and other common feeding stuffs as follows, per hundred pounds of each: Hay, 50 cents; cornmeal, \$1.12; oatmeal, bran, and middlings, \$1; potatoes, 29 cents; sugar-beets, 19 cents; parsnips and carrots, 18 cents; cabbage, 17 cents; apples, ripe, 16 cents; turnips, 16 cents; rutabagas, 15 cents; mangels, 14 cents; pears, 13 cents. Prof. Arnold's estimate is that good ripe apples have a feeding value of not less than eight cents per bushel of 50 pounds, and are as good for other stock as for milk cows. He thinks it is as much of a loss for any one who has stock to consume them to waste good apples as to waste good roots. When fed with reason and appropriate food, they are health-inspiring as well as nutritious, and are only injurious when fed immoderately.

He states that an experiment in feeding three cows with moderately sour apples, ripe and mellow, for several weeks, at the rate of 12 to 20 pounds to each cow daily, gave him a finer flavored butter than he ever saw from grain or grass. He says he has known others to feed them in larger quantity and for a longer time with satisfactory result, and their butter to be not only fine flavored, but to possess remarkable keeping quality, and the stock to remain perfectly healthy. He has likewise proved them to make excellent milk for cheese. The managers of cheese factories have noticed an improvement and increase of milk when their patrons' cows have been fed moderately with apples. This testimony in regard to the feeding of this fruit to stock is timely and valuable, and merits careful consideration from farmers everywhere.

Butter on the Farm.

There are many ways, says an Eastern exchange, by which the butter produced on the farm might be improved in quality and quantity, and the proceeds increased from 20 to 50 per cent. Thus a farmer who takes to town only \$5 worth of butter a week gets \$260 a year; if he can add 25 per cent to that he gets \$325, and with a gain of 50 per cent he gets \$390, and the extra \$130 would buy a good many things wanted in the household and on the farm; and yet by a little further effort he can make the amount fully double the original \$200 and have \$520 without additional cost of money or labor.

A part of what would conduce to this end is stated by a correspondent to another paper thus:

"Since 1870 I have weighed all my milk night and morning. My best cow gives 8000 to 9000 lbs. of milk per year. I have three or four that do that. I have 10 that give 7000 lbs. Cows that give less than 5000 lbs. I sell. A cow yielding 5000 lbs. of milk a year will, at 22½ lbs. of milk to one pound of butter, yield 222 2/3 lbs. of butter; but at 16 lbs. milk to a pound of butter it will be 312½ lbs. butter, a difference of about 90½ lbs. of butter in favor of proper feeding, which 90½ lbs. multiplied by the price per pound the farmer receives, say 30 cents, equals \$27.10, which the farmer loses each year. Farmers lose by low feeding. High feeding gives greater results."

This weighing of the milk, testing the cows, and knowing to a dollar what one is doing is a great help to the dairy farmer, and for that matter to every farmer. It enables him to get rid of the poor milkers and to replace them with good ones; and the latter cost no more to keep or to handle than the former. Then he can

improve his produce by breeding to a bull of a good milking strain, and thus add additional quarts to each head daily. Again, he can study what feed is best calculated to increase the flow of milk. He can save ice, and thus keep his butter in better condition and take it to the ice itself.

He can get with this extra gain the best implements instead of using the poorest and meanest; and with improved pans, churn, creamer and worker, make his butter worth 10 to 15 cents a pound more, and the people to run after him for it.

It is no mean thing for the people to say, "Such a farmer makes the best butter brought to this town, and we indeed cannot get all we want, for everybody wants it." Such a man takes a pride in having the best cows, breeding to the best bull, making the most butter, having the name for the very best, and getting the highest price. But how many neglect all of these points and make the poorest and meanest stuff that goes to a market!

FORESTRY.

A Curious Tree.

In the Elk River valley, a few miles out of Eureka, there is a natural curiosity, which the Standard describes as follows: It is a fir tree whose roots straddle a prostrate redwood 100 feet from its upturned roots, at which point the body of the redwood measures 6 feet in diameter. The redwood was evidently blown down by the wind. The roots of the fir tree come from the ground on both sides of the redwood—two main roots on either side—and the four coming together on top of the tree as it lay on the ground, form the body of the fir tree, the trunk of which is 4½ feet in diameter 4 feet from the top of the log, upon which it is securely held by lateral roots running into the ground. This redwood tree, when standing, could not have been less than 350 feet high, judging by the proportions of the part now remaining, which by actual measurement is 150 feet, the end of the redwood trunk extending 50 feet beyond where the roots of the fir straddle it.

We took pains to measure the main roots of the fir where they come up and form the body of the tree, and found them to be from 16 to 20 inches across the top and over 2 feet through.

In building a logging road some 12 years since, a section of the redwood was cut out to allow the passage of teams, and the wood was found to be in a perfect state of preservation, and it remains solid and sound to this date. Can some student of natural history tell us how many years it took for the fir tree to acquire the size of 4½ feet in diameter 4 feet above the roots, and then let us know how long this giant redwood has been lying on the ground?

WANTS AREOROUS HEDGES.—The view of the surrounding country from the highlands around Reno is grand. Beautiful green fields and pleasant-looking homes dot the valley and form a natural panorama pleasing to the sight of any one who can see beauty in the unfoldings of Dame Nature. But one thing is lacking to embellish the otherwise fascinating picture, and that is the notable scarcity of trees.

The farmers in this locality will find it materially to their advantage to inclose their fields, and in fact their entire farms, by a systematic hedge of trees. These trees could be set such a distance apart as to answer the purpose of fence-posts, to which wire fencing could be attached, thereby insuring an inclosure permanent in its character, and to which no expense, in the shape of resetting posts, would henceforth be incurred. Hardy trees, such as the locust or cork elm, would be admirably adapted for such work and would combine the ornamental with the useful. If this plan was adopted, in a few years' time this valley would not only be beautiful, but would be permanently inclosed. A few trees set out every spring by each farmer will soon do the work. Such a move would also be profitable, inasmuch as the trimmings from the trees when they become large would furnish an abundance of the finest kind of firewood. (This is a suggestion that our farmers will do well to consider.—Reno Gazette.)

FOREST-PLANTING FOR ARIZONA.—The Phoenix Herald thus pleads for arboriculture: The cultivation of forest trees scarcely occupies enough attention among land-owners in our valley. There should be at least 20 acres of forest set out on every quarter section, and the result would be both beneficial to our climate and provide for an emergency that will be upon us before we are prepared for it, viz.: the exhaustion of the natural growth of firewood. It will be but a short four or five years more till mesquit firewood, about this valley, will be a thing that has passed into the original elements, and the necessity for something to take its place will be pressing and firewood will soon double or triple in price. The present supply of cottonwood is limited, and moreover it will require two or three cords of cottonwood to go as far as a single cord of hardwood. There is no time to be spared in this matter. The sooner we begin the raising of timber the sooner will we be able to protect ourselves against an inevitable scarcity of wood.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Next State Grange Meeting.

Many farmers and their wives, sons and daughters are looking forward with glad anticipations to Tuesday, October 4th, when the State Grange opens at Santa Rosa. There are hundreds more who ought to be in the ranks of the P. of H. looking happily forward to that event.

Surely there is much more to attract Patrons to these meetings than to ordinary gatherings of classes or clans. Plans are to be discussed not only for the material advancement of members but for the richer benefits that elevate the mind and soul, and help the world along. No body of men and women is known to meet who greet each other with more kindly feelings and heartfelt good will.

The social exercises are also very attractive and seem to be enjoyed more and more every year by those privileged to attend.

The literary program is almost invariably instructive and entertaining, and increases in importance from year to year.

It is already time that brothers and sisters all over the State should be preparing to do their best to make the coming meeting a success beyond all that have gone before it. Let those who have business to present for consideration have it carefully prepared in such a way that it can be considered intelligently and fully in as brief a space as possible. Those who will speak and occupy the valuable time of the session should enrich their minds by due study and reflection on the themes most likely to be discussed.

Proper thought and research should be had beforehand to bring forward for candid and thorough consideration such questions as will tend to advance the special needs of farmers and Grangers and to prepare them the better to act unitedly, and in confidence to guard their rights against the aggressions of the individuals and corporations who unjustly oppress them in their industrial pursuits.

Many spirited and valuable essays, as well as highly entertaining original and selected contributions, have been presented through the literary committee of the past few sessions, and there seems to be no reason why members of the State Grange of 1887 should not expect as rare, if not a better, treat than ever before from its many talented and dutiful writers.

Let all do their best, even at considerable sacrifice, to make the coming session in this and all respects a gratifying success. Those who cannot come can, with loyal and generous effort, send at least some thoughts and kindly expressions to benefit and encourage not only those who do go, but the thousands who will read the inspiring sentiments contributed in the widespread reports of the occasion.

The Committee on Literary Exercises for 1886 individually requested to be excused. But no new committee was appointed at the last session, and recently, upon being reminded of the fact, Worthy Master Johnston reappointed the old committee, adding Sister Maria B. Lander, with the strongly-expressed wish that all shall serve, at least for the present term. We hope his wishes will be unreservedly complied with and their united efforts rewarded with excellent success, to the gratification of all.

Literary contributions and suggestions for aiding the literary entertainment can be addressed for the committee to any of the following members, or to the care of Secretary J. Chester: A. T. Dewey, S. F.; J. D. Hoffman, Lodi; A. P. or E. Z. Roache, Watsonville; Mrs. James Marsh, Stockton; Maria B. Lander, Martinez.

Titles and Taxes.

(Written for the RURAL PRESS by J. W. M.)

It's hardly in a body's power
To keep at times frae being sour,
To see how things are shared;
How best o' chieles are whyles in want
While cuifs on countless thousands rant,
And ken na how to wait.

—Burns.

There have appeared occasionally in the RURAL PRESS articles written in opposition to the theories of Henry George, socialism and anarchy so called, and, as far as I can recollect, there has not appeared one defensive or apologetic.

It cannot be that among the numerous readers of the PRESS there is not one who shares Henry George's views on land titles and taxes, and is able also to give a reason therefor. It cannot be that the PRESS will accord space to one side only, or that its readers care only for one side. We are told that the Czar of all the Russias has a paper printed for his own perusal, in which nothing of fact appears which would be displeasing to his Imperial Highness, or suggestive of anything but universal contentment in his dominions, despite his ever present body-guard and the staring letters "Siberia" on the map of Russia. We expect this from a Russian autocrat, but from the sovereigns of America we expect better things, and if I offer my ideas on these vexed questions, though varying from generally received opinions, I hope to find a place and a patient hearing, and that not even

one timid soul will mail those terrible words, "stop my paper," in consequence—like a true autocrat of America.

Against the oft-repeated statement that land is the only real and secure property, we have now the slogan of a new political party. *Man has no property in land.* So used have we been to the idea of land as property, that when we hear it first controverted we treat the attempt as idiotic, hardly believing it possible for a sane mind to seriously entertain the idea.

Yet the most serious, deepest and ablest thinkers of the age had thought earnestly on the subject, and arrived at the same conclusion as Henry George, almost before he was born.

In 1841 we have Ralph Waldo Emerson placing the following language in the mouth of a radical: "I find this vast network which you call property, extended over the whole planet. I cannot occupy the bleakest crag of the White hills or the Alleghany range but some man or corporation steps up to me to show me that it is his. Now, though I am very peaceable, and on my private account could well enough die, since it appears there was some mistake in my creation, and that I have been *missent* to this earth where all the seats were already taken, yet I feel called upon in behalf of rational nature, which I represent, to declare to you my opinion, that if the earth is yours, so, also, is it mine. All your aggregate existences are less to me a fact than is my own. As I am born to the earth, so the earth is given to me, what I want of it, to till and to plant, nor could I without pusillanimity omit to claim so much. * * * Besides, I know your ways, I know the symptoms of your disease. To the end of your power you will serve this lie which cheats you. Your want is a gulf which the possession of the broad earth would not fill. Yonder sun in heaven, you would pluck down from shining on the universe, and make him a property and a privacy if you could, and the moon and the North Star you would quickly have occasion for in your closet and bed-chamber."

In like manner we can call on Herbert Spencer, who in his *Social Statics*, published in 1850, but actually written in 1842, says: "Equity, therefore, does not permit property in land. For if one portion of the earth's surface may justly become the possession of an individual, and may be held by him for his sole use and benefit, as a thing to which he has exclusive right, then other portions of the earth's surface may be so held, and our planet may thus lapse altogether into private hands. Observe now the dilemma to which this leads. Supposing the entire inhabitable globe to be so inclosed, it follows that if the land-owners have a valid right to its surface, all who are not land-owners have no right at all to its surface. Hence such exist on earth by sufferance only. They are trespassers. Save by the permission of the lords of the soil they can have no room for the soles of their feet. Nay, should the others think fit to deny them a resting-place, these landless men might equitably be expelled from the earth altogether. If then the assumption that land can be held as property involves that the whole globe may become the private domain of a part of its inhabitants; and if, by consequence, the rest of its inhabitants can then exercise their faculties—can then exist, even—only by consent of land-owners; it is manifest that an exclusive possession of the soil necessitates an infringement of the law of equal freedom. For, men who cannot 'live, move, and have their being' without the leave of others, cannot be equally free with others." And much more to the same import.

From John Stuart Mill I will add a few short extracts: "When the 'sacredness of property' is talked of, it should always be remembered that any such sacredness does not belong in the same degree to landed property. No man made the land. It is the original inheritance of the whole species. Its appropriation is wholly a question of general expediency. When private property in land is not expedient, it is unjust. * * * The claim of the land-owners to the land is altogether subordinate to the general policy of the State. The principle of property gives them no right to the land, but only a right to compensation for whatever portion of their interest in the land it may be the policy of the State to deprive them of."

These quotations are made to show that the notion that land is not property is not simply a whim of Henry George nor the idle vapors of scheming demagogues, but an idea which has engaged the attention of the best and wisest. But a sound argument is in itself as good from the pen of Henry George or the humblest scribbler as it is from John Stuart Mill or any other writer of repute, and the only reason for quoting their language is to get a respectful hearing.

I maintain with these writers and with Henry George that no man possesses a valid, 'exclusive claim to one foot of land anywhere. Whatever improvements may be made on land, they are made on the people's land, the people's property, and not on individual property, and for the holding and using of such improvements the holder must contract with the people; for if I use that which belongs to others, I must make terms with those parties if I wish to be honorable and just. The land is the entailed inheritance of every one born on the earth, and this birthright can neither be sold, bartered, taken nor given away.

I have already occupied space enough, and if this much is granted me I will ask for more in

which to show the consequences of this principle when it shall obtain among the people as a basis of action and law, that instead of anarchy and ruin it will be productive of universal justice, prosperity and peace.

Tulare, July 4, 1887.

Grange Work and Progress.

(Prepared Weekly by M. WHITEHEAD, National Lecturer.)

Since the publication of the census report of 1880, we have heard much said about the wonderful increase of wealth in our favored land, and at no period in our history as a nation has this wealth been piled up so rapidly. By far the greatest proportion of this wealth is grown out of the ground. We might almost say it is created by the labor of our farmers, but it does not stay with us. Who gets it? Those who for years past have been controlling legislation and by unjust laws and unequal taxes are taking from us what of right is ours. Here are a few figures to study and to think about, while gathering our harvests for this year.

By the census of 1850, the estimated value of farms in the United States was \$3,271,575,000. In 1860 they were valued at \$6,535,000,000, showing an increase of more than 100 per cent. In 1870 the value of the farms was estimated at \$9,262,000,000, showing an increase during the decade of \$2,627,000,000, or less than 40 per cent. In 1880 the value of the farms was estimated at \$10,197,000,000, being an increase during the decade of \$935,000,000, or only a fraction over nine per cent. When it is remembered how many millions of acres of new land were taken up and developed into farms in these later periods, the actual decrease in value can be plainly appreciated. In the one State of Pennsylvania the census of 1880 shows that the farms of the State lost, in the ten years between 1870 and 1880, over sixty-three millions of dollars of their value.

Of many more figures that might be given in this same direction, let us look at those of our live-stock. The value of the live-stock in the United States in 1850 was estimated at \$544,000,000, and in 1860 at \$1,089,000,000, being an increase during the decade of \$545,000,000, or more than 100 per cent. In 1870 it was estimated at \$1,525,000,000, being an increase during the decade of \$435,000,000, or less than 40 per cent. In 1880 it was estimated at \$1,500,000,000, being a decrease during the decade of \$25,000,000. Truly, thoughts for thinkers! How else can we stop this steady backward tending of agriculture, except by a thorough organization and education of farmers everywhere, such as the Grange offers?

The growth and prosperity of the Grange at the present time is in no way the result of excitement or of any wave of popular feeling which is passing over the country. It is the legitimate result of calm, deliberate thought among intelligent farmers who have looked the situation over, examined the Grange platform, and decided that they will not only assist in the work which the Grange is doing, but that they will become recipients of the educational, social and material advantages which are enjoyed by the members of the Order.—*Rural Vermont.*

PROGRESS.—Three more new Granges; one each in Ala., Cal. and N. Y.

GOV. ROBIE, as Master of the Maine State Grange, has printed a brief history of the Order in Maine. The number of Granges, and their aggregate membership, since the State Grange was formed in 1874, have been as follows: 1874, 70 Granges, 2000 members; 1875, 136 Granges, 5000 members; 1876, 225 Granges, 12,000 members; 1878, 140 Granges, 8215 members; 1880, 119 Granges, 7039 members; 1881, 8549 members; 1886, 199 Granges, 14,531 members.

The first co-operative store in Texas was established by the Grange in Bell county in 1875. There are now in the State 150 retail stores in successful operation, besides a large wholesale house in Galveston. Every one of these co-operative stores that has started on a cash basis and stuck to it has succeeded; while in nearly every instance where they have attempted to do a credit business, they have been failures.

DURING the past six months the Order has been steadily increasing in Vermont, and is growing in popularity day by day. The printed discussions of educational, economic and other questions are drawing the attention of not only thinking farmers, but of progressive men of other classes, to the Grange. It has a wider scope and a deeper meaning than a superficial glance at the Order would show.—*A. M., Vermont.*

GILEAD GRANGE, Mich., has received 32 new members since May 1st, and expects to reach 200 before the year closes.

OAK HILL GRANGE, Maine, has received 60 new members since March 1st.

Let every heart and hand unite
In the benignant plan,
The noble purpose, just and right,
To aid our fellow-man.

Eden Grange.

At a meeting of Eden Grange on the 9th inst., "Committee" writes the *Haywards Journal*, the question of receiving Grange reports upon the condition of the crops and the prospects of harvest was brought up. In the earlier times of the Grange these reports were a prominent feature; and afterward they afforded a more direct information of the localities of the State. They were more instructive to the members than the general reports of the country. The aggregate of the reports was then sought for by the Department of Agriculture in preference to all others, and that department, through the present Commissioner of Agriculture, now Master of a subordinate Grange at Wash-

ington, D. C., is now soliciting the renewal of these reports.

It was suggested that a committee be appointed to prepare such reports at each meeting, each member of the Grange being required to obtain data in his or her locality to be given the committee. This is intended to comprehend individual facts as to area planted, kind of crop, yield per acre, market value on the ground and the comparison of these with former years. Under this system, as formerly conducted, each member obtained a better and more thorough acquaintance with his or her neighborhood, so educating themselves in affairs that more immediately concerned them.

Comments were made upon the present condition of crops in Alameda county. The condition was generally favorable compared with other localities, yet much short of the usual abundance. One member stated that recently, looking from his farm, he counted 160 stacks of hay, but that morning there were but 10, showing the comparative shortness of the crop and the extraordinary demand.

It was agreed by the fruit-growing members that the auction system of selling fruit gave promise of a better market in the future. The acting Overseer expressed the belief that if the farmers of Alameda county appreciated the worth of Eden Grange to its membership they would certainly apply for admission.

The Worthy Master Away From Home.

[NUMBER 2.]

(Written for the RURAL PRESS by MRS. WM. JOHNSTON.)

The plank was lowered and we were permitted to step ashore. Carriages had been provided, and we were soon driving through the streets of Honolulu to the Royal Hawaiian hotel, where comfortable rooms were assigned us. Soon our trunks were delivered in good shape and a nice luncheon served, to which most, if not all of us, were ready to do justice.

After a good bath and change of clothing most of the party took a stroll through the hotel grounds, which cover a block. The building itself is large, including, with the cottages attached, about 100 rooms. It is three stories high. The first floor contains sleeping apartments. The second is reached by two broad flights of stairs on the outside, meeting in the middle of building and joining the balcony—the rear corresponding with the front. Here you enter a wide hall, extending the full length of the hotel, from veranda to veranda, crossed in the center by another hall leading to the parlor, dining-room, office and some sleeping-rooms. The third floor has sleeping-rooms exclusively. All of these apartments are furnished with stationary washstands, abundantly supplied with the best of soft artesian water, which is very warm, necessitating the free use of ice. The rooms are well kept and the service generally is good.

In the evening the King's band gave a concert to the guests. The band occupied a large permanent stand erected for it near the front of the hotel, while the guests were provided with chairs upon the verandas and benches placed across the driveways, which, for the occasion, are closed to teams by means of ropes stretched across the street entrance and strung with lanterns. The hotel was illuminated from the first floor to the observatory, the front being hung with about 250 Chinese lanterns fantastically arranged. The brilliant electric lights toned down by the milder gleam of torches dotted over the lawn, the gaslight from the inside, the soft, dry, balmy air, the great variety of tropical trees, plants and flowers, all so beautifully blending with the charming music, made it seem truly a fairy-land or a foretaste of the heaven we all hope some day to enter. The musicians, untiring in their efforts to add to the pleasure of the evening, continued their entertainment until the approach of the "wee sma' hours," and before retiring made the Americans happy by rendering in charming style the good old tune of "Yankee Doodle." I could but compare it to some of the concerts given by Sacramento people to Eastern tourists who honor us with a visit. But all pleasures of this world have an end, and so did our first entertainment upon the Hawaiian islands.

The next morning found us, after a good night's rest, ready at 10:45 A. M. to start to the King's Palace, which was but a block away. The distance being so short, we walked, arriving promptly at 11, and were received by the King's Chamberlain at the door, after safely passing the guard at the gate. The ladies of the party remained standing in the hall, while the gentlemen were taken to a side hall to lay aside their hats and canes. When they returned all were conducted to the King's room. The W. G. M., Atkinson, upon being presented, introduced each one to his Royal Highness, who in return bowed gracefully as we passed. We formed a circle around the elegantly furnished room and gazed at his Highness about five minutes, he returning the compliment, after which he retired from the room, without our hearing the sound of his voice.

The Chamberlain informed us that we were at liberty to look around and enjoy ourselves in any way we desired. From this room we strolled out into a wide hall, upon the walls of which were hung portraits of all the past kings and queens of the kingdom. Crossing this, we entered a room immediately in front of and divided by sliding-doors from the dining-room, in

which were hung the portraits of the present King and Queen.

Here also we found the great feather robe. It was about the size and shape of a buggy robe, but is indeed a marvel. At first glance you would think it was made by some ingenious housewife by pulling bits of cloth through canvas. There were but two colors in it, red and yellow—the shades found upon the wings of California blackbirds—the former color predominating, being the cheaper feather. The yellow feathers cost \$1 apiece, as there are only two of that shade in one bird. The natives kill these birds and use them to pay their taxes with. So great has been the effort to obtain these feathers that the birds have become almost extinct.

For a description of the dining-room I will refer my readers to the account of the King's table given in the Bible, for I could think of nothing else while passing through it and examining the silver upon the tables. The workmen were engaged upstairs putting in the electric light, so we were not invited up, but were informed that the King wished us one and all to leave our autographs in his great register, which we did. We were granted the privilege of strolling through the grounds and gathering flowers, and then passed out from the palace grounds through another gate. The evening was spent by the gentlemen of the party in Masonic work in their Lodge, while the ladies were again entertained by the band.

(To be Continued.)

AGRICULTURAL NOTES.

CALIFORNIA.

Butte.

ORCHARD WITHOUT IRRIGATION.—Oroville Register: Mr. Joseph Farnan, who owns a ranch south of Oroville, has been experimenting for the past three years with fruit, and is convinced that fruit trees on his land need no irrigation. He has some of the finest four-year-old apricot trees in the State, and they have not received a drop of water except rain-water. His peach trees are doing finely and his grapevines cannot be excelled. If any one wants to see fine trees growing without irrigation we hope he will drive down to Mr. Farnan's and take a look at his splendid young orchard.

HAY.—While grain-hay is not nearly so abundant as last year, yet there has been cut in Butte and Yuba an immense amount of alfalfa, which to a certain extent will take the place of grain-hay.

A VETERAN.—The first mowing machine ever introduced into Butte county, as far as we have been able to ascertain, was by P. R. Hutchins in 1859; it is owned and run at the present time by Wm. Flowers of this county, and does good work.

Calaveras.

REMARKABLE VINES AND TREES.—Lodi Sentinel: On the ranch of F. Hubert, near Burson, is an apricot tree measuring 7 feet 5 inches in circumference. It is a seedling, planted March 10, 1857. Mr. Hubert says the fruit is of superior quality, and that this year he will gather 1500 pounds from this one tree. John Wildermuth, whose ranch is two miles northeast of Campo Seco, is quite proud of six fig trees planted in 1857, the trunks of which range from 6 to 7½ feet in circumference. From them he dries three crops of figs, aggregating 20,000 pounds, each year. He has a special process of drying the fruit, which on that account brings top prices. From these six trees the proprietor realizes over \$1000 per year. Geo. W. Cutter of Campo Seco has a number of orange trees which average over 3000 oranges to the tree. This fruit took the first premium at the State Fair for excellence of flavor. Matson & Williamson of Stockton own a piece of land near Burson on which grows a delicate grapevine 4 feet 5 inches around the trunk on the surface of the ground, and 4 feet 4 inches 5 feet above the ground. It then divides into two branches, each 2½ feet in circumference, both of which have entwined themselves around a huge oak, which now appears literally loaded with grapes. If trailed upon an arbor it would reach over 300 feet.

Contra Costa.

BRUSH-BREAKING.—Antioch Ledger: James O'Hara is clearing off the chaparral on the tract recently sold by him to Erdman, Sussman & Martin. He has had a roller made with which he breaks the growth down, pushing it with the horses as a header is worked. He is able to clear off a large tract daily in this way. When the chaparral is broken down he fires it, and the demolition is complete.

Fresno.

GOOD BARLEY.—Republican, July 15: Elmer Humphrey is the fortunate owner of one of the best yields of bald barley in the county. From 38 acres of land near town in the Fresno colony, he thrashed last week 800 sacks of barley, each sack containing 2½ bushels. The heavy yield is traceable to good plowing and sub-irrigation.

PROFITABLE COTS.—W. A. Cowan has in his orchard 200 three-year-old apricot trees which came into bearing this year. From these trees he gathered about eight tons of fruit, 8600 pounds of which were dried, making 1710 pounds of dried fruit. This was sold at from 11 to 15 cts. per lb., amounting to \$210 for the dried fruit. The green fruit was sold for \$83, bringing the total up to \$293. The cost

of gathering and drying amounted to about \$40. Mr. Cowan's experience is that it takes 4½ pounds of very ripe fruit to make a pound when dried, and the less ripe required 5½ pounds for a pound when dried.

Humboldt.

A STALWART SHORTHORN.—The Eureka Standard notices the arrival in that city of a band of magnificent working cattle—15 steers and two bulls—from the ranch of L. C. Tuttle near Garberville. They had been purchased by the Occidental Mill Co., and were on the way to Ryan's slough. One of the bulls, a full-blooded Durham, tipped the beam at 2010 pounds, and was reckoned "the largest ever seen in Humboldt county."

Inyo.

ANOTHER PIECE OF "DESERT."—Independent: This year Gustave Sanger, on his place at Alvord, planted 300 acres in wheat, oats and barley, alfalfa seed being put in with the grain. The grain will average one ton per acre. The alfalfa has come up very thick among the grain. Mr. Sanger also planted a large number of shade and fruit trees, and all are making rapid growth. The land is neither better nor worse than thousands of acres along Owens river.

Los Angeles.

EDITORS PRESS:—We are having exceptionally cool, pleasant weather. A little fog mornings, enough to toughen hay, makes it bale splendidly. Good barley hay is selling for \$12 to \$14 per ton. Hay is nearly all stacked and baling is being rushed with all possible speed. Heading is nearly all done, but as yet I have not seen a thrasher in this part. Apricots sell here for one cent per pound, delivered to the canners, while near San Francisco they fetch 1½ cents. Why is it so?—D. J. O., Spadra, July 16th.

San Benito.

GOOD CROPS.—Hollister, July 17: The thrashers are now all busy and grain is turning out much better than was expected. In many places the crop is larger than that of last year. Many ranchers who had expected only half a crop are getting from 20 to 30 bags an acre. Fruit is doing well. Four new driers were started near Hollister last week. The apricots and peaches are unusually fine. The vines are heavily laden.

San Bernardino.

FRUIT CROP.—Ontario Record, July 13: The general tenor of all our fruit reports is the same—a most flattering showing for citrus fruits; good prospects on both the Muscat and Sultana grapes; on deciduous fruits, especially the apricot, a great unevenness that in some degree can be accounted for as a result of the youth of the trees.

BUCKWHEAT.—Riverside Press, July 16: D. H. Burnham on Magnolia avenue a few weeks ago sowed his entire orchard to buckwheat for the purpose of fertilizing and enriching the ground. It came up, flourished, and to-day has passed the season of bloom and is loaded with a fair crop of buckwheat. It has been generally supposed that buckwheat would not do well in California. We shall watch this experiment with interest. The crop does not appear to drain the moisture unnecessarily from the trees.

San Diego.

HORTICULTURISTS IN COUNCIL.—Union: The regular quarterly meeting of the San Diego County Horticultural Society was held at Lodge hall, Poway valley, July 6th. There was a full attendance of members and visitors. The meeting was very interesting. Fruit-growing and fruit pests were discussed at length. The hall was handsomely decorated with flowers, evergreens and branches laden with fruit. A table reaching across one side of the hall was filled with choice fruit for all, for which the ladies of Piermont are entitled to the credit. After the meeting, the fruit was placed at the disposal of those in attendance. Five new members were added to the list. The next regular meeting will be held at the schoolhouse in El Cajon valley in October.

San Joaquin.

LODI WATERMELONS.—Sentinel, July 16: The first ripe watermelons we have seen this year were left at our office by Messrs. John Acker and J. D. Huffman. Their patches are reported to be in fine condition. S. Ferdun shipped four crates of watermelons from here last Thursday. This is the first shipment of the season. Mr. Ferdun will be ready to send away a carload in about 10 days.

THE MOKELUMNE CANAL.—Record-Union, July 18: C. E. Grunsky, Deputy State Engineer, has gone to take charge of the engineering work for the Southern California capitalists who recently bought the Mokelumne Irrigation Co.'s property. The survey will be commenced to-day and pushed without delay. Mr. Grunsky will remain at the works for three weeks and be assisted by E. E. Tucker. On the completion of the survey, contracts will be let for building a canal to take a large body of water from Mokelumne river and run over rich lands in the northern part of San Joaquin county.

San Luis Obispo.

GRAIN AND LEGUMES.—Morro Cor. Tribune, July 6: Heading is about half done in this section and a two-thirds crop anticipated. Beans are looking well, several hundred acres being planted with them this season.

LAS TABLAS ITEMS.—Cor. Tribune: C. Beaver's vineyard is two years old. I am well acquainted with the vineyards of Napa and

Sonoma counties, and this vineyard in growth and thriftiness is equal to any I ever saw there. His corn, squashes, peas, beans and melons look finely. J. Beaver has a fine garden and young orchard—apples, pears, peaches and Bulgarian prunes, the latter excelling all others in growth; they appear to have found a congenial soil and climate here. He has very fine melons, vines and the largest black-eyed peas I have ever seen. Mr. White tells me that the ground has never been tilled since the seed was planted. If we can raise such vegetables and orchards without cultivation, what would they be if well tilled?

Santa Clara.

FATAL BOILER EXPLOSION.—On Tuesday of last week, Alex. Gordon's thrashing machine was at work on the Randol ranch, Mountain View, when the boiler attached to the engine blew up, killing A. T. Carr, the engineer, and Louis Saliceto, the fireman. Carr was at his post and had just started the engine for the day's work when the explosion took place. The engine and boiler were lifted and thrown 400 feet, passing over the separator and lodging against a tree. At the inquest it was in evidence that the engine was 20 years old, and an examination of the firebox showed that there was not a bolt in the crown-sheet head, and there were scales on the inside and outside. The coroner's jury returned a verdict to the effect that Carr and Saliceto came to their deaths by an explosion of a defective engine boiler.

THE CHEESE FACTORY.—San Jose Mercury: The stockholders met at the factory Saturday, July 8th, to hear the report of the directors in regard to the business of the factory for the past year and to elect directors. R. McCubbin, James Southerland, W. H. French, J. R. Billings and L. P. Alexander were chosen directors for next year, and organized by electing J. Southerland president, W. H. French treasurer, and L. P. Alexander secretary and salesman. A dividend of \$4 per share was declared on each share, the value of the shares being \$50. From the annual statement the following figures are taken: Pounds of milk received, 1,465,957; pounds of cheese made, 147,250; which as compared with former years, under the management of former cheesemakers, shows a gain of about 10 per cent in the amount of cheese from the same amount of milk. The cheese commands the highest market price, and the weekly sales at present in Santa Clara and San Jose are larger than at any time in the past history of the factory. Within the past year the factory has been put in complete repair, including new vats and also by the introduction of steam pipes into the curing-room, which is a new departure in the manner of heating, and much superior to the old method, as it gives an even temperature in every part of the room. It is believed to be the only factory in the United States so heated, the idea being original with Mr. J. M. Bigger, the present superintendent.

GRAIN EXCELLENT.—Gilroy Advocate, July 16: The barley crop of the valley runs far beyond the expectation of the farmers. Phelps Bros. ordered 1000 sacks for theirs, but found on thrashing that they needed 600 more. Indeed, all grain is plump and heavy and gives more to the acre than was anticipated a few weeks ago. Ordinary sacks filled with barley stored in the mill this week average 112 pounds to the sack—a good indication of the quality of the grain.

Solano.

PICKERS AND CUTTERS.—Cor. Vacaville Reporter, July 14: The crew on J. W. Gates' ranch are entitled to the cake for big work in drying apricots. Tuesday was the last day of the season; consequently the cots were small and decidedly mixed, which fact should be borne in mind. William Jones cut and spread on trays 780 pounds; Wm. Cummings 832½ pounds; Mrs. Wooderson 801 pounds. Messrs. Barr and Wooderson carried in from the drying ground, sorted and sacked 460 trays of dried fruit, which were immediately filled by the cutters with fresh fruit. The cutting for the day amounted to 5505½ pounds, which was all sulphured and spread on the drying ground by Messrs. Allmen and Hester. Among the pickers Wm. Robnett took the lead, he having 117 baskets to his credit—his average for the season was 95 baskets per day.

Sonoma.

CROP NOTES.—Petaluma Courier, July 13: The thrashers are now at work. While to all appearances the grain crop was never better, it is found upon thrashing that the berry, by the few days of recent hot weather, has shriveled, and in consequence the yield in pounds will not be so great as was anticipated a short time since. The corn, potato and vegetable crops are promising. So likewise is the fruit. The prospective yield of the latter is unusually large, but between the Petaluma cannery, the Petaluma fruit-drier and outside demands, all of it can be disposed of profitably.

Tulare.

THE ARMY WORM has made its appearance in several alfalfa fields in the vicinity of Woodville. J. H. Grimsley informs the Times that about two weeks since he was congratulating himself over the prospect of raising about \$3000 worth of seed from his 120-acre field, but the little worm came along and cleaned him out entirely. Tule river flows through his place, and a few days since he had occasion to cross the dry bed of it, which was literally covered with the worms. They appear to be increasing, and are moving northward. Two generations of this pest appear each summer. Their ravages

may be checked, in a measure, by surrounding the field where they are found with a double furrow, or a ditch, and crushing those that fall in.

Ventura.

WALTER FRUIT-DRIERS.—Free Press, July 15: The Walter fruit-drier owned by A. N. Barnes has a capacity of two tons daily, while S. R. Thorpe's has a capacity of eight tons. The construction of these driers is simple, the under part being of iron and brick, and the remainder of wood. A shaft extends through the drier, to which is fastened a driving-wheel, and is moved by turning a crank. Also two spider-wheels keyed on the same shaft on the inside to support the cases which hold the fruit. These cases pivot as the wheels revolve and are kept on a level. This brings the trays on which the fruit is dried to a wide door at one end of the drier, where they are easily removed and are replaced by others. The drier is so constructed that it separates the hot air from the vapor, and the air is superheated over and over, thereby creating a continual circulation throughout. This drier is the result of years of experimenting, until its inventor believes he has reached perfection in its construction and usefulness. It is rapid in its work; it will dry anything without scalding or burning; the fruit is taken out at the same place where it goes into the drier; it is either permanent or portable, and is particularly valuable to owners of small orchards. It dries whole pears and prunes, preserving their shape; nothing better can be found for drying raisins, and instead of evaporating, it preserves the jelly of fruit.

SESPE ITEMS.—Free Press, July 15: The honey crop in this neighborhood has proved a total failure. The bee-keepers prepared to extract the 1st of June, but were unable to do anything at it on account of the unfavorable weather. The fruit is getting ripe and those little busybodies, the linnetts, are beginning their ravages. They are a terrible pest that every one must fight if they expect to have any marketable fruit. The Sespe ditch is coming on apace, but will be no benefit to crops this season.

ARIZONA.

FURNISHING HORSES TO CALIFORNIA.—Semi-Tropic, July 10: One hundred and fifty horses were taken through Colton on a special freight train this morning. They were from the ranges of Arizona and were being taken to Los Angeles for sale. They were nearly all young and some of them were extraordinarily handsome and would have made fine carriage horses but for the disfiguring brands on their hips. It is said that Arizona will at no distant day be able to furnish horses for all Southern California.

NEVADA.

EDITORS PRESS:—At H. Springmeyer's ranch, near Genoa, I found them all busy haying. Mr. S. has 200 acres in alfalfa, which will produce seven tons to the acre—worth \$13 per ton delivered in Carson. Fred Danberg has several hundred acres in alfalfa which yields three crops a season. Haying is two weeks later than usual in Nevada this year.—F., Mason Valley, July 16th.

OREGON.

WEALTH OF GRAIN.—A telegram from Portland, 19th, says that F. S. Rowe, manager of the O. R. & N. Co. has just returned from an extended trip over all the lines of the company and reports the grain crop in the inland empire the largest and best in the history of the country. Every field of fall and spring wheat, barley and oats will yield a full crop, something never known before, and this section will furnish 450,000 tons of grain for export.

SHORT FRUIT CROP.—Willamette Farmer: There is no remembrance of any year when the fruit yield in Oregon has been so small as the present. We hear of some districts where the cold rains and frosts of May did not cause destruction; but such sheltered spots are few and the general report says there is little or no fruit growing. The loss of the apple crop will be most severely felt of all, for there is almost a total failure of that most valuable of all fruits, and old orchards that have never failed before are now barren.

WASHINGTON TERRITORY.

GRAIN SAMPLES.—Walla Walla Union, July 16: Judge J. D. Laman has received several fine samples of grasses and grain grown in the valley, to be placed on exhibition in the Northern Pacific exhibit car, which that company intends to send all over the East for advertising purposes. Particularly fine are those furnished by John Scott, Club and Blue-stem wheat, which will average between 45 and 50 bushels to the acre. He has also a sheaf of oats which will harvest over 75 bushels to the acre. The Agricultural Society has a sample of oats going 70 bushels to the acre. Hon. P. J. Kelly of the Umatilla county portion of the valley has sent in samples of Club and White Landreth Club wheats which go 50 and 60 bushels to the acre. John R. Hood sends in a sample of fall-sown Club wheat which goes 50 bushels. Fred Stine sends in a sample of Club and Chili wheat, mixed, which will go over 50 bushels to the acre, and W. R. Hammond a sample of barley which averages 60 bushels for a field of 160 acres—a first-class yield in any country.

Is it Worth While?

Is it worth while that we jostle a brother,
Bearing his load on the rough road of life?
Is it worth while that we jeer at each other
In blackness of heart—that we war to the knife?
God pity us all in our pitiful strife.

God pity us all as we jostle each other;
God pardon us all for the triumphs we feel
When a fellow goes down 'neath his load on the
heather,
Pierced to the heart; words are keener than steel,
And mightier far for woe or for weal.

Were it not well in this brief little journey
On over the isthmus, down into the tide,
We give him a fish instead of a serpent,
Ere holding the hands to be and abide
Forever and aye in dust at his side?

Look at the roses saluting each other;
Look at the herds all at peace on the plain—
Man and man only makes war on his brother,
And laughs in his heart at his peril and pain;
Shamed by the beasts that go down on the plain.

Is it worth while that we battle to humble
Some poor fellow-soldier down in the dust?
God pity us all! Time oft soon will tumble
All of us together, like leaves in a gust,
Humbled, indeed, down into the dust.

—Joaquin Miller.

Her Poor Cousin.

"Really, Corinne, you are too harsh with your cousin; remember she is the child of your dead father's sister."

"I can't help it, mamma; the girl is a burden to us and you know it."

"I should think she was rather—a help," said Mrs. Stanley, toying idly with her fork and knife. "She certainly dresses your hair for you and performs other little duties that you could not do yourself."

"Oh, I know she tries to earn her board and clothes, which is only right and proper, but I think she ought to keep more with the servants, where she belongs. I was going to tell you that I have accepted an invitation to see 'Faust' with Mr. Bronson this evening."

"His attentions are becoming very marked, Corinne. They say he is worth about a hundred thousand a year. Would you marry him if he asked you?" said Mrs. Stanley, putting emphasis on the "if," for she knew her daughter had been angling for the millionaire.

"How do you know that he has not asked me already?" said Corinne with a laugh, and then the conversation ended.

Meanwhile pretty Louise Lynn sat in her small hall bedroom in the great Fifth-avenue house, and wondered why her lot was so hard. Silently she recalled a face she had loved long ago. It was the old, old story. They had exchanged passionate vows to each other. At her father's former country-seat their names were carved on the same tree; there they had sworn, with clasped hands, to be true to each other forever. But the course of true love had not run smoothly. Her father, unwilling that Louise should become the wife of a poor man, had forbidden their meetings. A knock at the door interrupted her musings. Corinne had sent for her to dress her hair.

"You really would make a capital maid," Miss Stanley remarked, as she surveyed her costume in an opposite mirror when thoroughly dressed for the opera. "Marie," glancing toward her French femme de chambre, "will have to look out for her laurels. Here, Louise, just carry my white merino cloak downstairs, won't you, while I follow?"

Miss Stanley and her cousin had been in the dining-room about five minutes, when the former glanced impatiently toward a clock on the mantel, exclaiming, "It is certainly very odd that Mr. Bronson doesn't make his appearance."

Just then a ring was heard at the door. As it was not answered immediately, Corinne turned to her cousin and said, "Louise, go to the door."

"Is my position in this house that of a mere servant?"

Louise spoke the words in tones with a faint, almost imperceptible quiver; otherwise her demeanor was perfectly calm.

"Yes," was the unhesitating answer. "You are merely a domestic servant—nothing more."

"Very well; in that case I will obey."

She left the room with a stately step, though her wounded heart was beating passionately.

With a steady hand, too, she unfastened the hall door.

A gentleman was standing outside.

"Are Mrs. and Miss Stanley at home?" he asked politely.

His voice made poor Louise's heart beat quicker than ever.

"Ashton!" she exclaimed. "Can it be you?"

"Louise!"

The gentleman had caught her hands in both of his and stood gazing eagerly into her face.

"Oh, Louise," he went on in tremulous

tones, "what miracle is this? I have sought for you ever since my return, but to no purpose. And now to find you here! I can scarcely believe my senses!"

"You could not have cared much for me," poor Louise said, through her tears, "because—because you have never written me a line since—since—"

"Written you, Louise! I wrote a dozen times."

"Then the letters miscarried, for I never received them. Ah! I know my father's death—my change of address—"

But at this moment they were interrupted by the appearance of Corinne on the scene.

"For heaven's sake, Louise, what is the meaning of all this?" she cried. "I was not aware," she added scornfully, "that you aspired to know Mr. Bronson."

The angry speaker's face was livid with consternation and rage.

"Mr. Bronson!" ejaculated Louise, astonishment overcoming every other feeling.

"Yes! Mr. Bronson," said Corinne, mimicking her.

"What does this mean, Ashton?" asked Louise, turning to her lover.

"I am now known, dearest, as Mr. Bronson, after a distant uncle, whose fortune I inherited, and who wished me to take his name. The accession to this estate brought me back from California to search for you—but in vain."

There was a moment's silence, and then Louise, as she looked at her cousin, said:

"And so your grand Mr. Bronson, cousin Corinne, was all the while my dear old Ashton," and she proudly clung to his arm. She could not restrain a slight exultation in her tone.

"Yes, darling!" said Mr. Bronson, pressing her arm, "and I am sure your cousin will congratulate us. I certainly owe her much for having given a home to my treasure."

Did Corinne congratulate her cousin? She was obliged to do so outwardly, at least, for Louise and Mr. Bronson were married a month later. But there are some smiles that mean frowns, and we fear Corinne's were such.

A Novel View Point.

It has often been remarked that the wealthiest man gets no more than his board and clothes, after all. All the rest are outside accessories to his life which he can enjoy only as he is educated up to them.

A pleasing anecdote, in which this fact was prominently brought out, is related by the New York Tribune, concerning the well-known surgeon, Dr. George F. Shady.

The doctor has a pleasant country-house on the Hudson, some seven or eight miles north of Kingston, known as "Pine Ridge." He formerly spent his summers there, and, being fond of driving, owned a team of fleet-footed sorrels. With these he would spin over the hard country roads at a lively gait almost daily, usually driving himself.

While driving on Albany avenue in Kingston, on his way home one afternoon, being alone in the buggy at the time, he was hailed by a newsboy who, mistaking him for a coachman, shouted:

"Say, John, can't you give a fellow a lift?"

"How far are you going?" asked the doctor.

"Only out to General Smith's," replied the boy.

The urchin sprang to the seat beside the driver, and the conversation ran as follows:

"Whose rig is this?"

"Dr. Shady's."

"Oh, yes, he's the feller from New York. He lives in Flatbush, by the river. I heered of him. Do you work for him?" asked the boy.

"Yes," said the surgeon.

"What does he give you?"

"My board and clothes."

"Gosh, is that all? Well, he gives you pretty good clothes, though," said the boy, hastily inspecting the driver's make-up. "But you could get more'n that. Major Cornell's coachman gets \$30 a month and found. Think of that!"

"But the major is a rich man, and can afford it," said the driver.

"How long have you been with the doctor?"

"Ever since I was a boy."

"Never worked for anybody else?"

"No."

"What do you do for him?" continued the interviewer.

"Oh, everything he asks me to do. I wash and dress him, black his shoes, sometimes clean his horses, harness them—in fact, I am his man of all work."

"Is he so old, then?"

"No, he's about my age."

"Then he must be a lazy chap, anyhow."

After a brief pause came this poser from the boy:

"Do you like the doctor?"

"Sometimes I do and sometimes I don't. Occasionally I get so disgusted with him that I feel like running away."

"Why don't you?"

"Oh, it's no use, I cannot. I have to be satisfied."

"Well," indignantly ejaculated the boy, "I think you're a big fool."

"But here is General Smith's," said the doctor.

"All right. By, by, John," sung out the boy, as he alighted upon the road.

Thoughts.

[Written for the RURAL PRESS by "NETTLE."]

Love for one being cannot be confined to that particular soul; it will overflow on our friends. This overflow is a test of love.

The more we love a person the less, as a rule, we feel like talking when in his presence. The very consciousness of being near him is all-sufficient.

What more may man ask than to be a child of God?

If he who criticises cannot by his criticism benefit either others or himself, he is doing no good, but is 'creation's blank.'

Wouldst thou have thy burdens lightened? Help thy brother in his need and tenfold shall it be returned thee.

Wise people realize how little they know, but the most ignorant persons think wisdom is concentrated in them.

God has planted two seeds in each soul. One of these seeds is love of earth, the other love of truth. He allows man to choose which shall grow at the expense of the other, for both cannot be masters. Foolish man too often gathers to himself straws from the muck-heap of worldly and beastly pleasures, never looking up to see the handle of truth he might grasp and thereby attain divine heights which would ever lead him to still higher, broader visions.

Pleasures, cares of dress, and subsistence absorb the attention of man's priceless soul, engross his thoughts, till his stunted spirit knows no purer aim than to eat, drink, and pamper the body. The gems of purity, love, truth, flash their gorgeous rays before some people's eyes in vain, for what care they for the body's demands and delights? A new hat, the dance-floor, gossip, all yield gross, absorbing pleasures to them, and would one tell these blind followers of foolishness of greater triumphs, think you belief would find place in their dull souls? We cannot do without the "cumbrous clay" habitation of the soul, but we can devote less time to pleasuring it, and should find our real joys in the higher realms of truth. Believe me, I do not underestimate bodily duties. I am particular in the care of my person, and feel it a duty to try, as far as reasonable, to make myself agreeable; but just as the condition of the plate we eat from—though there may be little excuse for uncleanness—is not as important as what we eat, so we should, at the same time that we take good care of our bodies, remember also that the life is more than meat. Our narrow souls should reach eagerly for the true wisdom, for the culture that broadens the sympathies, for the toleration induced by contact with different minded men, while at the same time we are necessarily but mechanically serving the body. Yet each person must investigate for himself before he will fully accept these words. Would that our body-weighted, earth-burdened souls could cast off all low impressions, could free themselves from thoughts of all but truth, the truth that includes God! Each individual soul outvalues space, outweighs matter; and shall we spend more time on the transient case that envelops it than we shall to expand, strengthen, purify our one lasting gem? The wise spirit values soul greatness more than the total of earth's treasure.

Haywards, Cal.

Roughing It in California.

J. S. Tibbits of Santa Rita, an occasional contributor to the RURAL, writes to an Eastern exchange as follows:

People living at the East, surrounded by all the comforts and conveniences of civilized life, can have but a faint idea of the inconveniences and discomforts to which many are subject, or subject themselves, here at the West. To see people living in dug-outs and caves, or in tents, as I have seen them in Colorado, and in rude board cabins or in booths of cypress boughs, as I have seen here in California, would seem to Eastern dwellers in luxury as a little rough. But this is more apparent than real, for thousands of well-to-do persons are living at the West in just such habitations and enjoying themselves hugely, too. I have by no means seen nor experienced the rough habits of the '49ers, but such as I have experienced may not be altogether uninteresting to your readers.

Last winter, while engaged in working for a wealthy ranchman, I boarded with the men who were at work on the place. We occupied a rude cabin, formerly used for a barn. Benches were constructed on one side, filled with straw, in which we slept. I had a scant supply of straw under me, plenty of blankets over me, and a "right smart" supply of bedbugs and fleas all about me. Under such circumstances I did not oversleep myself. Our cook was a gentleman who had been reduced from affluence to penury. He was by no means a model cook, and if "cleanliness be akin to godliness," he was sadly lacking in the latter virtue. He would come in from his hunting expeditions and without washing his hands commence preparing our meals. He always had a pipe in his mouth, the ashes from which would fall in plentiful showers into the food, forming a conglomeration not found in any cook-book. Under these circumstances you may be sure I did not gorge myself with food.

For upward of a year I have been living all alone, doing all my work, indoors and out, myself, having neither wife, cat, dog, rat nor

mouse to disturb me. Part of the time I occupied a small room, 7x14 feet, partitioned off from a barn, doing my cooking by a fireplace outside. I pride myself on becoming quite an expert cook, though I now and then make slight mistakes, such as putting a lot of common starch into my flour instead of baking powder; putting half a pound of ground coffee into my pancake batter instead of flour; letting a black sooty pot fall into a pan of stew, throwing the gravy all over me; and pouring some cold water into my stew when I was cooking some dumplings, causing them to fall so that it was about impossible to stick a fork in them. But these are mere incidents, liable to occur in any well-regulated family.

While thus living by myself I have demonstrated the following important matters: First, that a person can live, and live well, on less than one dollar a week for food; second, this voluntary exile from the busy scenes of the world, with its freedom from care, anxiety and grinding toil, is conducive to one's peace of mind and devotional feelings; is a powerful exorciser of the demon of despondency and melancholia, and is promotive of both health and happiness.

In conclusion, I can say with Burns:

"Let others love the city,
And gaudy show at sunny noon;
Give me the lonely valley,
The dewy eve and rising moon."

Cabbage-Garden Epics.

EDITORS PRESS:—Joaquin Miller has made a discovery! He finds that with books of poetry the world is amply provided, while the stock of good, solid cabbageheads is somewhat slim. He deems the cabbage-garden poet equally needful to mankind with the ink-slinger of honeyed words and measured rhymes. He even graciously concedes priority to him of the cabbage garden. I say "cabbage-garden poet" advisedly. We are too apt to forget that the real meaning of "poet" is simply "maker." And only last Sunday I heard Bishop Wingfield remark that "the poetry of action is nobler than the poetry of language."

Now I feel proud of the "poetry of action" displayed by thousands of our California farmers! I feel proud of their cabbage-garden epics! I feel proud of the poetry of Felix Gillet, who has converted a barren hill into a fertile paradise, propagating and producing all things pleasant to the eye and good for food! I feel proud of the poetry of Messrs. Hatch and Briggs, and Coates and Shinn, and their myriad compeers. Through faith they have wrestled with doubts, and difficulties, and discouragements, and have triumphed gloriously. They have issued their poetry by the carload; cherries and peaches, and prunes and pears, bound in boards and lettered in black, to the entertainment and delight of millions of our good friends East!

It is high time our farmer poets were better known and appreciated. There's about as much genius required by a farmer poet as by an ink-slinger. Your book poet may sing of the sweetness of the young lamb's voice or thrill the heart with the touching tragedy of little Boopet, but the heroine is the farmer poet's darling and the young lamb's voice is the voice of the first-ling of her father's fold. Your book poet may stalk in solitary state through the "forest primeval" by day, but at night "forest primeval" is a gruesome subject and cold comfort unless the farmer poet's clearing be at hand, and the welcome and welcoming light of his hospitable cabin radiate through the dark. Your book poet rhymes about flowers and bowers and showers, and brooks and nooks and crooks; your farmer poet lives in them and by them and with them.

Now, though, as the apostle of cabbage-garden poets, I thus magnify my office, God forbid that I should depreciate or undervalue book poets. Few live more in their company than I. By their favor I have the best society always at command and revel in its wit and wisdom. That complaint so fearfully prevalent, "the blues," otherwise classed as lonesomeness, dullness or mopeomeness, finds in me no congenial void in which to develop root or branch, and I gratefully acknowledge my obligation to that invaluable specific, printers' ink.

But I want the farmer poet to get his due meed of the world's appreciation and applause. I want to have his volume considered. He spreads it wide open by the highway-side, in the lovely valley, on the lonely hilltop, by the rippling stream. He that runs may read it. The lines are fair, writ in rows of greenery and blossom, in purple cluster, in rosy, golden fruit, in seas of waving grain. They speak of enterprise and energy, of science and skill, of law and order, of loving labor and tender care, of nature's harmonies and heaven's bounty. Aye, more! They speak of patient continuance in well-doing, of conquest by obedience, of victory through self-denial. What more do the ink-slingers tell us?

Boys! and book poets all! Take off your hats, and "Three cheers for the cabbage-garden poets of California!"

EDWARD BERWICK.

Carmel Garden, July 14, 1887.

DEFINITION written by a small girl of San Mateo: "Tunnels are hollow holes running under the ground."

To Prepare Rose-Scent Jars.

'Tis a pity that so few housekeepers, comparatively, know the never-ending satisfaction to be derived from the possession of a rose-scent jar, yet, at the cost of a little painstaking, they are within the reach of the majority.

Nothing gives more subtle, delightful perfumes to an apartment than one of these jars, which should be opened every morning after the necessary cleaning and dusting is finished, for an hour, and then carefully closed.

All your friends will ask: "What gives your rooms so delightful a fragrance?" It is such a pure yet delicious odor that it charms every one.

The preparation of the rose-stock should be detailed to the care-taking member of the family who never forgets anything.

Gather the rose petals in the morning, let them stand in a cool place, tossed up lightly for an hour to dry off; then put them in layers, with salt sprinkled over each layer, into a large covered dish—a glass berry-dish is a convenient receptacle. You can add to this for several mornings till you have enough stock, from one pint to a quart, according to size of jar; stir every morning, and let the whole stand for 10 days. Then transfer it to a glass fruit-jar, in the bottom of which you have placed two ounces of allspice, coarsely ground, and as much stick cinnamon, broken coarsely. This may stand now for six weeks, closely covered, when it is ready for a permanent jar, which may be as pretty as your ingenuity can devise or your means purchase. Those with double covers are the best, and very pretty ones in the blue and white Japanese ware (I believe the dealers call it kaaga), holding over a quart, can be bought for 75 cents.

Have ready one ounce each of cloves, allspice, cinnamon and mace, all ground, not fine, one ounce of orris root bruised and shredded, two ounces of lavender flowers and a small quantity of any other sweet-scented dried flowers or herbs; mix together and put into the jar in alternate layers with the rose-stock, add a few drops of oil of rose geranium or violet, and pour over the whole one-quarter of a pint of good cologne.

This will last for years, though from time to time you may add a little lavender or orange-flower water, or any nice perfume, and some seasons a few fresh rose petals. You will derive a satisfaction from the labor only to be estimated by the happy owners of similar jars.

MINOR MORALS FOR MARRIED PEOPLE.—

The last word is the most dangerous of infernal machines. Husband and wife should no more strive to get it than they would struggle for the possession of a bombshell. Married people should study each other's weak points, as skaters look out for the weak parts of the ice in order to keep off them. Ladies who marry for love should remember that the union of angels with women has been forbidden since the flood. The wife is the sun of the social system. Unless she attracts there is nothing to keep heavy bodies, like husbands, from flying off into space. The wife who would properly discharge her duties must never have a soul "above buttons." Don't trust too much to good temper when you get into an argument. Sugar is the substance most universally used through all natural products! Let married people take a hint from this provision of nature.

THE SEED OF THE SEEDLESS.—The old joke comes around once more. Last week, says the *Valley Echo*, we received a letter from Sonoma county, the writer of which stated they were going to try growing orange trees, and having heard of the famed Riverside Navel, and wishing to plant the choicest kind, desired to know the name of some party who kept Riverside Navel orange seed for sale, and the price per ounce. Who can furnish a supply? Don't all speak at once.

A GENUINE SURPRISE-PARTY, says the *Anaheim Gazette*, was given Mr. and Mrs. Ed Newhan of Placentia last week. Mr. N. has been sick for several months. He had his fine crop of barley cut with a reaper, but had not been able to haul it together. Last Friday several of his neighbors, with wagons, teams and hands, drove into his field and commenced loading and hauling his grain into stacks, and continued the good work until the sun went down. Such surprise parties have the true ring, and commend the neighborhood.

TO THE POINT.—In the White mountains one summer Henry Ward Beecher drove a passenger-wagon from the Twin to the Crawford, just for fun. In turning around his team became tangled and his wagon bid fair to tip over, when a Portland and Ogdensburg conductor, looking out of a chamber window of the hotel, shouted: "Let go your leaders, you old fool." "That's good advice, young man," was Mr. Beecher's calm reply, as he followed it.

CANON WILBERFORCE says that down in Maine the whisky is locked up before it can get into men. In this State it gets into men before it is locked up—and the men are locked up with it.

YOUNG FOLKS' COLUMN.

A Bit of Green.

[Written for the RURAL PRESS by AUNT SUSIE.]

"O Johnny! look! look! See this bit of green. I must have it to take to mother," calls out a dirty, ragged little newsboy named Tom, and both boys get down on the pavement and try to pull up a few blades of grass that have struggled through the cracks in the paving-stones of a busy street in a large city.

You boys and girls who live in the country and see great fields of grain waving in the wind and ripening in the sun have no idea what it is to the poor little children in the cities to see a few blades of grass; but I have seen them clap their little dirty hands and jump up and down for joy.

"Well," says Johnny, "there are four pieces, just two for each of us, but I'll give you mine because your mother is sick, and you know the grand folks uptown always have flowers and

lost your pennies?" "No, sir," answers Tom. "I'm getting a bit of green for mother, so she can look at it while she is sick in bed; it will make her almost think she can see grandpa's fields again." Just then Tom looked up and says, "See, I have three pieces, and I found four this morning." Something in his eyes and the tone of his voice makes the old man's heart beat faster than usual, and he quickly asks, "What is your name, little boy, and where do you live?"

"My name is Tom Jones, and I live way downtown in a tenement-house, and mother is awful sick. Buy a paper, sir?"

"Yes; I'll take all you have left, so you can go home and show me where you live."

So on they go, and at last reach Tom's home. He goes in the room, and says, "Mother, here is some more green, and a gentleman to see you."

The sick woman starts up in bed as the gentleman stands beside her. One look is enough; she calls "Father!" and he exclaims, "Emma, is it possible?" and folds her in his arms. Tom stands by dumb with astonishment, then all at once a happy thought comes to him, and he exclaims, "Are you grandpa?" "Yes,

him upstairs to bed, and looks in once more to see if his daughter is comfortable in the neat, pretty little room she used to sleep in long ago. The rest and good care she has soon restores her to health and strength, and the happy days go quickly by. Tom, of course, goes to school, but on Saturdays has fine fun on the farm; he has some chickens—all his own—and takes much good care of them; has a pony to ride that follows him all about, partly for love and partly for the sugar he gets now and then.

One day Tom ran in the house and said: "Do you know, mother, I believe grandpa found us and brought us here and made you well, just because I stopped that day to find you a bit of green. I'm awful glad I did. Do you suppose if some other little boy should find some grass he would find a new grandma and grandpa and a nice place like this?"

"I hope so, dear," answered his mother; "anyway, it is always best to take a 'bit of green' or a ray of sunshine as they come."

DOMESTIC ECONOMY.

MOLASSES CAKE.—One cupful of sugar, one cupful of butter and lard, mixed, two cupfuls of molasses, one teaspoonful of ginger, one teaspoonful of nutmeg, one teaspoonful of cinnamon, one-half teaspoonful of cloves, a little salt, three-quarters of a cupful of strong coffee and two eggs. Beat all together, add four cupfuls of flour, after mixing well, add one-half cupful of boiling water, in which one teaspoonful of soda has been dissolved. Adding a few currants, raisins and a little citron makes it almost as good as fruit cake.

FLOUR PUDDING.—One quart of sweet milk; wet and stir smoothly into a little of this cold milk six tablespoonfuls of flour. When the remainder of the milk boils, stir in this wet flour, boil ten minutes more and set away to cool. When cold, add the well-beaten yolks of six eggs, then the whites, which have been beaten to a foam that will pile up; now beat this into the cold pudding until it all looks even and light. Bake another half-hour and serve hot.

CHEESE OMELET.—Butter and cut in quarters a sufficient number of slices of stale bread to line a medium-sized pudding-dish. Over this grate a little dry cheese or cut it in small pieces; add another layer of bread, then cheese, and so on until the dish is nearly full. Make a custard of one pint of milk, two eggs, and a little salt. Pour this over the bread and cheese and bake a half-hour in a quick oven.

SAGO PUDDING.—Take half a cupful of sago, put in a stewpan with a pint of milk and the yolks of two beaten eggs; keep stirring until the grains are transparent, then they are done; take from the stove and flavor with a teaspoonful of vanilla or lemon. For frosting, beat the two whites of the eggs with a cupful of powdered sugar; flavor with vanilla or lemon.

STRAWBERRY ICE.—Take two quarts of strawberries, put them into a muslin bag, dip in hot water, and squeeze out the juice until nothing but the pulp remains. To every cupful of juice add three tablespoonfuls of sugar and the same amount of cold water; put in a freezer, pack in ice well salted and covered with bran, and freeze. Serve in tiny glasses or deep saucers.

SCRAMBLED EGGS.—Break six eggs into a bowl, and season with salt and pepper. Pour into a heated skillet, containing one tablespoonful melted butter, and as the eggs cook, turn them up constantly from the bottom. Serve when slightly dried. The eggs should never be stirred, only the yolks broken, as they will present a better appearance than when beaten.

CREAM CAKE.—Half-cup butter, two cups sugar, three eggs beaten in one cup sweet milk, three cups flour, three teaspoonfuls baking powder. Cream for filling: One pint milk, let come to a boil; add half-cup flour, one cup sugar, two eggs; boil a few minutes; flavor with lemon or vanilla and a lump of butter. This makes six layers.

FRENCH ROLLS.—Of light bread dough, take as much as will make one loaf. Work into this one egg, one heaping tablespoonful of lard, two of white sugar. Set in a warm place to rise. When light, work down, knead again; when very light and puffy, roll out. Cut with biscuit cutter. When raised, bake 20 minutes in a quick oven.

BUTTERMILK MUFFINS.—Beat hard two eggs into a quart of buttermilk, stir in flour to make a thick batter, about a quart, and lastly a teaspoonful of salt and the same of soda. Bake in a hot oven in well-greased tins. Muffins of all kinds should only be cut just round the edge, then pulled open with the fingers.

GINGER COOKIES.—One cup of molasses, one cup of sugar, one cup of butter, one teaspoonful salt, two dessertspoonfuls ginger, one teaspoonful soda, one-half cup warm water poured on soda, then put in molasses and stir well before putting in the other ingredients.

OYSTER FRITTERS.—Make a batter of one cup flour, half teaspoonful baking powder, pinch salt, two eggs, one cup milk; dip each oyster in this batter and fry in hot lard, as for doughnuts.

DRAWN BUTTER.—Half a teacupful of butter; two tablespoonfuls of flour; rub all together and pour into a pint of boiling water; add salt. Serve with boiled meats.

GRANDPA'S STORY.

my child, I am," he replied; and after giving Tom a good hug, in spite of his ragged jacket, he says, "Now, Tom, do you know where to buy some bread, meat, tea and other good things?" "Oh, yes, I know where to get them, if I only had some money. I have to pay for my papers, and shall only have 15 cents left; that won't buy much."

"Here is some money, Tom. Now go." So off he goes, as happy a little boy as the city contains, rich or poor. As soon as he is out of the room, father and daughter ask and answer many questions. It is the old, sad story—a farmer's daughter, tired of the country, going to a city for employment, marrying and being left alone and destitute. Her father calls in a doctor, and he finds she is not really ill, only weak and exhausted from lack of proper food and shelter. Her father says she and Tom must go back to the farm with him, as he is only in the city on business for a few days.

When they start, Tom is such a proud, happy boy, dressed all in new clothes. His mother leans back in her seat on the cars, pale and weak, still much better for the medicine and food she has had and the comforting thought of once more being at home, though she was too proud to let her parents know how much she needed help. It is quite a journey; but at last they get out at a quiet little station and find a comfortable country wagon waiting for them, as her father has telegraphed home the good news. They ride through shady lanes and cross merry little streams that seem to dance along happier than ever, and Tom is nearly wild with delight. At last they reach such a comfortable looking farmhouse, and in the doorway stands an old lady with open arms to receive the long-lost daughter. In a few hours Tom has been all over the place, and, tired out, falls asleep in his chair at the supper-table. Grandpa carries

green things when their folks are sick and dead; so you take these."

Tom is so delighted to have the grass he does not notice that it is not very cheerful to have Johnny compare his sick mother with "folks that are dead," so he runs home, and we will follow him. He goes on and on till he comes to a tenement-house, climbs up the dirty, rickety stairs and stops a moment to get his breath, he has run up so fast; then carefully opens a door and walks in on his toes so as not to make a noise, and leans over a bed in which lies his sick mother. He finds her awake, and says: "O mother! you will be well now. You said yesterday if you could see grandpa's green fields again it would make you well. This isn't a whole field, mother, but it is four pieces of green; just look!" and he proudly holds up the tiny blades of grass. The sick woman raises her head, and takes the bit of green, saying, "My dear boy, where did you get these?" Then Tom tells her, and says: "Now, mother, I must go and sell my papers, and if I can, I'll get you some more grass." So he puts his treasures in her feeble hand, and goes out. He is a bright-eyed little fellow, and in spite of his rags and dirt, seems different from the ragged urchins about him. He has sold nearly all his papers, when, as he stands calling out, "Last 'd'shun evenin' Post," he spies some more grass, and down he goes on his knees for it.

Just then a kindly, good-natured old gentleman comes along and says, "Look here, little chap, how do you expect to sell your papers if you stay down there, poking among the stones? What is the matter? Have you

TABLE OF CONTENTS.

EDITORIALS.—A Decision on Levees; The Smyrna Fig Problem, 57. The Week; Bad Environment; Valuable Eucalypts; The Barley Outlook, 64. A Fine Guernsey; Consumption and Production of Fruits; Fruit for the East; Prof. C. V. Riley, U. S. Entomologist, 65.

ILLUSTRATIONS.—Prof. C. V. Riley, U. S. Entomologist, 57. Grandpa's Story, 63. Imported Guernsey Cow, Rosebud 1037, and Her Calf, 65.

CORRESPONDENCE.—Let California Try Quinoa and Coca; The Elephant Potato, 58.

THE GARDEN.—Treatment for Potato and Tomato Diseases, 58.

HORTICULTURE.—The Apricot in the Upper San Joaquin, 58.

THE APIARY.—Experiments with Bee Forage, 58. Bee-Farming in South Africa, 59.

THE DAIRY.—How Good Butter is Spoiled; Clothilde Since Her Victory; Apples for Dairy Stock; Butter on the Farm, 59.

FORESTRY.—A Curious Tree; Wants Arborous Hedges; Forest-Planting for Arizona, 59.

PATONS OF HUSBANDRY.—Titles and Taxes; Eden Grange; Grange Picnic in Oregon; The Worthy Master Away from Home; Grange Work and Progress, 60.

AGRICULTURAL NOTES.—From the various counties of California, 60.

THE HOME CIRCLE.—Is it Worth While; Her Poor Cousin; A Novel View Point; Thoughts; Roughing It in California; Cabbage-Garden Epics, 62. To Prepare Rose-Scent Jars, 63.

YOUNG FOLKS' COLUMN.—A Bit of Green, 63.

DOMESTIC ECONOMY.—Molasses Cake; Flour Pudding; Cheese Omelet; Sago Pudding; Strawberry Ice; Scrambled Eggs; Cream Cake; French Rolls; Buttermilk Muffins; Ginger Cookies; Oyster Fritters; Drawn Butter, 63.

Business Announcements.

The Week.

During the week the usual heat wave has struck all the region east of the Missouri and Mississippi rivers. From north to south in this area heat like that from a furnace has raged. At Washington the mercury went higher than it has since the Signal Service was established, except in one instance. From all large centers of population have come reports of fatal prostrations by the score, and the event has proved nothing less than a general calamity. Records of heat have been 102 at Washington, 100 at Cincinnati, 100 at Pittsburg, 95 at Philadelphia, 102 at St. Louis, 104 at Raleigh, 103 at Charleston, and so on. Any one who knows the Eastern climate will understand that such degrees of heat are frightful in their effects.

From our southeast, in Arizona and New Mexico and adjoining Mexican States, there have been unusual phenomena of a different and more acceptable form, though injury has been wrought. There have been rainstorms, unprecedented in amount and untimely, which have washed out railways, flooded and destroyed crops on lowlands, made city streets water-courses, and in short have interfered seriously with business, travel, and industry.

With these unwelcome visitations in mind,

the Californian becomes more joyful in his heritage in this goodly land. His harvest proceeds without injury to product or laborer; his personal comfort is without alloy. He fears not heat nor untimely storm, but secure, with the broad ocean to furnish breezes to fan him, and the high mountains to shield him from sweep of winds, he beckons the heat and storm-oppressed to share with him an area which fortunately is large enough to make millions happy.

The Barley Outlook.

It is reported that barley is being eagerly gathered in by those who believe all the available supply for 1887-8 will be more than covered by requirements, and that barley will be good stuff to own before the season is over. Purchases in the country are said to be a good deal above city equivalents, which certainly indicates that the purchasers have faith in the situation. This agrees well with our own understanding of the outturn of the present harvest, and of the requirements of the next 12 months, which will certainly be far in advance of any similar period in our history. The *Herald of Trade* of this city seems to have a correct view of the situation, and supports it by computations which will be of interest to our barley-growing readers. The figures are about the same that have already appeared in our columns and the grouping of them to show the present complexion of the barley prospect is striking. The following is the barley supply for each year named, in cents:

	Crops.	Stocks.	Total.
1878-79.....	7,475,000	147,598	7,622,598
1879-80.....	8,250,000	806,500	9,056,500
1880-81.....	7,360,000	908,000	8,268,000
1881-82.....	5,070,000	595,000	5,665,000
1882-83.....	4,500,000	162,000	4,662,000
1883-84.....	7,060,000	820,000	7,880,000
1884-85.....	8,100,000	640,000	8,740,000
1885-86.....	5,900,000	608,000	6,508,000
1886-87.....	10,060,000	114,850	10,174,850

The totals of the above give the available supply at the beginning of each crop season, and to get the quantity consumed it is only necessary to deduct that shipped each season. For four seasons past the following is given, which will convey a fair idea of the consumption in the State:

Season.	Supply.	Shipped.	Leaving.
1883-84.....	7,880,000	399,271	7,480,729
1884-85.....	8,740,000	480,654	8,259,346
1885-86.....	6,508,000	219,886	6,288,114
1886-87.....	10,174,850	925,664	9,249,186

Now, to get the consumption, we give the above balance, less the quantity carried over into the following seasons:

Season.	Supply.	Stock.	C'n's mp'n.	Av prices.
1883-84.....	7,480,729	640,000	6,840,729	.94 1/2
1884-85.....	8,259,366	608,000	7,651,366	.97
1885-86.....	6,288,114	114,850	6,173,264	\$1.28
1886-87.....	9,249,186	798,000	8,451,186	1.00

The above totals of consumption show a wide variance, but the important fact of prices must not be overlooked. Each year of free consumption the average price by season shows that feed in our market was low.

The consumption of feed barley in California is rapidly increasing, as the table above shows. In this city the increased use of last year over the preceding one is shown as follows:

	Receipts.	Shipped.	Balance.
1885-86.....	1,115,075	219,886	895,189
1886-87.....	2,200,870	925,664	1,275,206

Taking the difference in the quantity on hand in this city on July 1, 1886, from that on hand July 1, 1887, and deducting it from the increased balance as given above, and still the consumption in this city last season was 21 per cent more than the season of 1885-86.

The great increase in feed barley consumption in the country must be obvious to all. The vast addition to our horse-power through the extended planting and cultivation of orchards and vineyards, the growth of interior towns with their manufacturing interests, etc., all have required a large increase in the numbers of work animals—in fact some estimate that the numbers have quite doubled within a short period.

This year's barley crop must be short; the hay crop is also short. These facts coupled with the increased consumption would indicate a year of good prices for barley and other feed grains.

"INSTINCT AND INTELLIGENCE," the article on manifestations of mind in animals, compiled by Dr. Dawson for our Veterinary department last week, is too interesting to be overlooked by the general reader.

Valuable Eucalypts.

As we announced in the last *RURAL*, the Board of Forestry Commissioners has been in session this week in this city. Various matters have been brought forward of which we shall give reports hereafter. President Abbot Kinney gave at one of the sessions an account of the several species of eucalyptus which the Board has now growing in seed-beds at Santa Monica, and as several of them are new to the State we propose to enumerate them and add notes of the characteristics and values of each, which we draw from the writings of Baron Von Mueller and other authorities on the Australian flora. We have often remarked that there are other and better eucalypts than those most widely distributed in this State, and we desire by this notice to call general attention to this fact, in the hope that propagators may take steps for the introduction and trial of other species.

One of the species which is now growing at Santa Monica is *Eucalyptus calophylla*, or "Southwest Australian red gum." It has the advantage of a greater proportion of foliage to trunk than other eucalypts. It occasionally has a trunk 10 feet in diameter. Baron Von Mueller says when grown on alluvial land it is free from resin, but on stony ranges it yields copiously the gum "kino." Its wood is esteemed for rafters, spokes and fence-rails, but soon decays underground, and is, therefore, of little account for posts, etc. The bark is used for tanning as a mixture with wattle bark from the acacias. The seed-cups are also said to possess the tanning principle.

Another species is *Eucalyptus resinifera*, which is the "red mahogany" eucalypt of South Queensland and New South Wales. It is a superior timber tree, the wood being prized for strength and durability. Von Mueller says it has proved itself the best adapted eucalypt for a tropical climate, but it is not so rapid a grower as some other species.

The *Eucalyptus rostrata* is a species which we have heard much about in this State, and is what we supposed we were generally growing under the name of "red gum;" but it has proved that perhaps most trees which we supposed were *rostrata* were really *viminialis*, which is a more tender species, and this may account for the disappointment which some have experienced in planting the "red gum." The true *rostrata* is a very hardy species, said to stand quite prolonged inundation of its roots and to thrive even on slightly saline ground.

It was found to thrive in India where our common "blue gum" (*globulus*) and other species failed. We desired in this State a variety more hardy than the *globulus*, and hence the disappointment we have had by getting *viminialis* instead of *rostrata*. The latter is a tall tree sometimes reaching 200 feet in its native land, but it has a more spreading habit than most of the tall eucalypts. The timber is very hard, heavy and durable; excellent for posts, railway-sleepers and the like—in fact this timber is the one solely chosen by the Government of Victoria for railway and bridge purposes. It is also employed by shipbuilders for a host of uses. Next to the jarrah from West Australia it is said to be the best for resisting the attacks of sea-worms, teredo, etc.

The last of the four species which Mr. Kinney says are doing best in the Santa Monica plantation is the *Eucalyptus corynocalyx*. This is the "sugar gum tree" of South Australia, a timber tree sometimes reaching 120 feet in height and 5 1/2 feet in diameter of trunk. The wood is said to be of good quality, but the tree is not of very rapid growth. It has the peculiarity of being something of a forage plant, for Baron Von Mueller says it is the only eucalypt except *E. Gunnii*, which has a foliage that attracts cattle and sheep, which browse on the lower branches, saplings and seedlings.

Such are some of the trees which the State Board of Forestry has growing. We trust they may thrive. In another column may be seen a resolution adopted by the Board looking to the acceptance of tracts of lands in different parts of the State where forestry stations may be established. This is of the highest importance. To have well-set groves of trees, each one with its name and nativity inscribed near it, will be to furnish all the people of the section an opportunity to study for themselves what trees promise to do best, and therefore which they had better choose for their own

planting. It will be an opportunity for object lessons in arboriculture which will be of inestimable value to the State.

Bad Environment.

That poor old alleged poker-player and convicted boodle-briber, Jacob Sharp, now meditates over his past life under the shadow of the State prison. That he has been justly convicted and sentenced there cannot be a shadow of doubt. And yet it may be a serious question whether he is not as much a victim as a criminal. "A victim," in the language of the *New York Standard*, "of that greed of gain born of the fear of want, which sanctifies the getting of wealth by any means, provided the successful man can keep out of the penitentiary." He was a sharp, shrewd, business man who had set his heart on procuring a franchise for a Broadway street-railway. It could only be had by bribing the Board of Aldermen. They were a lot of scoundrels for sale and Sharp bought them. He acted under the advice of a highly respectable law firm that would have kicked a Bowery street tramp down the elevator who had come to them to learn how he could safely crack a safe or burglarize a house. He acted on a principle that largely obtains in the Board of Trade rooms, in railroad offices, the privacy of bank parlors, political rings, and even among many leaders of fashionable churches, that there can be little or no harm to buy a man who advertises himself for sale. During an election a few years ago a saloon-keeper on the flanks of a mountain boasted he could control 40 votes.

"Go and buy him," said a leading politician of this State, "or the other side will get him; only be careful the log you sit on while conducting the negotiation is not hollow." There is no hiding the fact that the feeling prevails that the crime attaches to the bribe-taker and not the bribe-giver. This is the sort of atmosphere in which Jacob Sharp, down there in New York, lived, moved and had his being. It was the regular tradewind that blew up Wall street, down Broadway, and had carried many a man into the desirable haven of a marble front on Fifth avenue and a front pew in a stylish church. Is it strange that this old man, whose conscience perhaps was naturally a little elastic, should come to the conclusion that if these aldermanic scoundrels were willing to fill their pockets with boodle it was no concern of his?

Now it is well that Jacob Sharp should go to prison. It is well for Chicago to prosecute the boodlers who have disgraced the lake city till the last one of them is arrayed in striped pants. A suit has been started in this city that is likely to uncover the guilt of bribery in fixing three or four jurors in a recent case. This jury-fixing business has long been the curse and scandal of the courts, and we hope there will be no mawkish hesitancy in probing it to the bottom, no matter who it hurts.

But let not society roll up the white of its eyes in holy horror whenever a respectable citizen or good deacon kicks in the dash-board and runs away with his stolen plunder to Montreal or some other city of refuge. Society is largely responsible for this state of things. Judges may read homilies from the bench, grand juries indict, preachers declaim, and politicians vociferate, but this evil will go on, for where the carcass is, the vultures will gather. And it is not strange. We worship success, giving no heed as to the means. Poverty is the only devil that is feared in America, and the millionaire's palace our ideal of heaven. A man may have no more brains or conscience than a hyena, be a moral leper in broadcloth, but if he has a good bank account, society invites him to dinner, the pew doors fly open, and all the pretty girls regard him as a splendid "catch." And what is the consequence?

"Each for himself, and the devil take the hindmost" has become the law of trade. No matter whose life-preserver you seize so you get ashore. Our boys and girls grow up in this atmosphere. They are taught by example, if not precept, to reverse the successful man and avoid the men who have failed. And what can we expect to come of such a school but Tweeds, Jacob Sharps, Chicago boodlers, San Francisco jury-fixers, and the whole swarm of saloon politicians, election bribers and legislative corruptionists? We must make the tree good if we expect to gather good fruit. Do men gather grapes of thorns and figs of thistles?

A Fine Guernsey.

We do not hear as much of the Guernseys as we would like, although there are some fine animals in this State, notably the Yerba Buena herd of Henry Pierce. As a matter of fact, our stock-breeding readers generally do not contribute, as freely as we desire, the results of their experience and thought on matters connected with their business. Our live-stock interests are growing creditably, our dairies are putting in new and improved machinery, and our herds are being constantly improved by selection in breeding and by the introduction of well-bred animals. All these enterprises should prompt those engaged in them to compare notes and experiences for their own benefit, and to let the public generally know how much of life and achievement there is in their industry.

The engraving on this page will please all who have an eye for a good dairy cow, for whatever may be the individual preference for breeds, there is a harmony of points and outlines which pertain to all the best dairy animals. This is the "dairy shape," which has been considerably enlarged upon by some writers. Whatever may be the distinctive characteristics of the different breeds, there is something which makes all our best dairy breeds akin. There is, in the minds of most advanced breeders, an ideal of perfection, and they endeavor to develop their animals toward it. One of the first educational efforts of the young stockman is to fill his mind's eye with a correct ideal. He can do this best by actual study of the best animals. Animal portraiture is a help toward this end for those who have not the opportunity for comparative study of many animals, and it is to help form correct ideals as much as to celebrate the fame of individual animals or breeds that we aim to present upon our pages really good portraits of the best breeds.

This week we have an excellent portrait of a Guernsey cow—an imported animal purchased on the Island of Guernsey for \$1000 by I. J. Clapp of Kenosha, Wisconsin. Her name is Rosebud 1037, and the artist shows her young calf beside her. The butter yield of Rosebud when four years old, was in seven days 17 lbs. 10 oz. on grass and a daily feed of six quarts oats, bran and cornmeal. This cow has taken four prizes in England and several in this country. Mr. Clapp is well known throughout the country as a Guernsey breeder. There are in his herd about 40 pure-bred animals.

A STEAM WAGON.—In a machine shop at Auburn, Me., can be seen a novelty in the shape of a steam wagon, now in process of construction. The machine will have all the appearance of a common Concord wagon, with the exception that a part of the boiler and its covering will show above the body of the wagon. All the motive power will be concealed under the flooring. The power will be furnished by two small engines of about three-horse power. The boiler is made from iron pipe in spiral form. The wagon body contains two seats, easily holding three each.

A CERVINE TROTTER.—A young elk that has been trained to trot, and can go a mile in three minutes, caught the notice of a *Gazette* reporter at Reno last week. It was on its way to this city for a red-rubber stamp man, who bought it at Ogden for \$70, and will use it to draw his delivery wagon and the attention of the public.

Consumption and Production of Fruits.

The consumption of fruits of all kinds in the United States is enormous and constantly increasing. It is much greater than most people have any idea of. The fear that there will be an overproduction, except temporarily and in some specialties, is groundless. There seems to be a great rush just now into growing apricots, which, if continued for several years, might possibly result in overproduction; but it would only be temporary, if at all. The demand would soon come up to any reasonable degree of production. In the matter of prunes there is also a great increase in the area of trees; but the fact that there were no less than 30,000 tons of this fruit imported last year gives such a margin to draw from that our producers need have very little fear of overproduction. In the matter of citrus fruits, although the area of their cultivation is rapidly increasing, those sections of the country where the climate and soil are peculiarly well adapted to their growth need have no fear from overproduction, so long as proper attention is paid to the quality. The area best adapted to this culture, even in Southern California, is somewhat limited. No doubt large quantities of

Fruit for the East.

Since our last writing the California Fruit Union has sent two special ten-car fruit trains eastward. The first left Sacramento July 13th. The fruit consisted of Bartlett pears, peaches, plums and grapes. Strong & Co. sent four carloads; Gregory, Barnes & Co., two; Porter Brothers Co., two; and the other two carloads were made up by growers in the vicinity of Vacaville. The fruit is assigned to points east of Omaha, and the railroad company promised to put the train through on passenger time. The pears, peaches, etc., are from the down-river fruit section, in Sacramento county, and the grapes are from Vacaville. The first fruit train last year was forwarded on June 24th. This was found to be too early, however, and shippers have waited this year until the fruit has attained perfection. That shipped on the 13th was in prime condition.

On July 18th the second special fruit train left Sacramento. The shippers are Gregory, Barnes & Co., W. R. Strong & Co., and Porter Brothers. The train consists of ten cars and goes through on passenger time. Crawford peaches, Bartlett pears, plums and grapes comprise the shipment. Upon another page we

Prof. C. V. Riley, U. S. Entomologist.

We are glad to present to our readers upon the first page of this issue of the *RURAL* a striking likeness of Prof. C. V. Riley, U. S. Entomologist. It is not pleasant to make comparisons between things which are all good and between men who are rendering eminent public service, but it can be strongly argued that applied science has attained no higher industrial importance than in the field of economic entomology, and if this be conceded, the position of Prof. Riley, who is the acknowledged leader of the world in this field, becomes apparent without argument. This position is an award of merit. Fitness for it has been secured by a quarter of a century of unremitting labor—labor guided by genius and vitalized by the glow of enthusiasm. Industry, genius, enthusiasm—these three have conquered worlds, in war and in philanthropy, in philosophy and in science, and in industrial arts. We like an opportunity to present their achievements as a rebuke to listless, aimless living and as an incentive to the youth to choose life courses which gain the reward of an approving conscience and make the world the better for their tenancy of it. Therefore we give a sketch of

the life and public services of Prof. Riley, intending to convey thereby some slight token of our appreciation of his worth and in the hope of spreading abroad among our youth a desire to emulate his eminence and usefulness. In the sketch which follows we make no claim to originality. We draw the facts, and in some cases the expression, from a number of published sketches to which we have access.

Nativity and Youth.
Charles V. Riley was born in London, England, September 18, 1843. His boyhood was spent in Walton, a charming village on the banks of the Thames, between Hampton Court and Windsor. He subsequently attended private schools at Chelsea and Bayswater till the age of 11, when he entered the College of St. Paul at Dieppe, France. Here he remained

IMPORTED GUERNSEY COW ROSEBUD 1037, AND HER CALF.

citrus fruits will be produced in Central and Northern California; but such cultivation there also will be confined to comparatively small areas, if none but first-class fruit is accepted.

It should be the endeavor of fruit growers everywhere, and of all varieties, to produce nothing but the best, and to meet the question of supply by driving all that is inferior out of the market. Fruit-growing will ultimately come to that point. No producer of superior fruit need have any fear from overproduction.

SHORTHORNS FOR NEVADA.—Mr. H. F. Brown of Minneapolis writes that he shipped on July 7th the famous Shorthorns bought by W. J. Marsh & Son of Fort Churchill, Nev., of which mention was made a few weeks ago in the *RURAL PRESS*. The animals are Duke of Waterloo, Wild Eyes of Browndale 6th, Wild Eyes Duchess 12th, Wild Eyes Duke 11th. This is a very choice lot of Bates bred Shorthorns, which must prove of great benefit to the stock interests of the coast.

PRIZED BEYOND THE MISSISSIPPI.—A reader of the *RURAL PRESS* in Illinois writes for two back numbers, to complete Vol. XXXIII, and adds: "I have your paper bound each year, from nearly the first. It offers more and better information pertaining to California than anything else extant—I refer to current events and such things as are of interest to those who love California for herself alone."

give the latest announcement of the railway authorities concerning rates.

A NEW APRICOT.—A. D. Pryal of N. Temecal, Alameda county, brings us specimens of a new apricot he has originated by crossing the Royal and Blenheim. The cross thus obtained was grafted into a Moorpark tree and fruited for the first time this year. It is of good size, rather oblong, nearly equally molded on each side, its most obvious external characteristic being its exceptionally high color. Its ruddy hue is strongly deep for the coast climate, and bids fair to make the new variety famous. The flesh is firm and rich colored and the fruit seems to ripen evenly. Mr. Pryal has given much attention to crossing fruit varieties, and he believes this apricot his most notable success.

AMERICAN MACHINERY IN ITALY.—The United States consul at Milan, Italy, reports to the State Department that American machinery has a high reputation with the Italians, especially hydraulic wheels, turbines and windmills. If such is the case, it might be a profitable movement on the part of our machinists to look into the matter, and if it has a substantial existence try and make some arrangement for a representation at the International Exhibition of machinery to be held in Milan next May and June. If the time is too short for an exhibit of this kind, any Italian partiality for American machinery should not be lost sight of.

three years, and then spent nearly three years more in a private school at Bonn, Prussia. These six years of study on the continent of Europe are the secret of his familiarity with the French and German languages, and of his power of speaking them with exceptional accuracy. Two passions characterized his boyhood, one for collecting insects, the other for drawing and painting. The first brought him, as a mere boy, in contact with the late H. W. Hewitson, a celebrated naturalist, who had an unrivaled collection of butterflies and birds at Oatlands, Weybridge, near Walton, and later with many eminent naturalists at Bonn and the neighboring village of Poppelsdorf. The artistic talent is recorded in many a framed sketch yet cherished at Walton, and enabled him easily to carry off the best prizes in drawing at Dieppe and Bonn.

The early loss of his father, and the care at school of a younger brother, developed in young Riley a self-reliance and sense of responsibility which gave a practical turn to his views and convinced him that the classical education he was getting lacked many elements of utility, and was not the best preparation for active life-work. So at the age of 17, with that love of adventure, of free institutions and of rural life which often accompanies the artistic temperament, he sailed for New York, where, after a seven weeks' voyage, he arrived with little means and "a stranger in a strange land." He went West and settled upon a farm in Illinois;

here, during four years, he acquired that experience of Western agriculture that can be gained only by actual farmwork. Fond of animals, of flowers and fruit, of bee-keeping and of all life as manifested on the farm, young Riley devoted himself enthusiastically to the calling he had chosen. Of an inquiring and experimental turn of mind, he aimed to improve on the methods in vogue, and soon won the esteem of all who knew him; and though so young, was sought for in counsel and honored at public gatherings, at which he became intimate with prominent farmers of Illinois.

Early Public Work.

Just about the time of his majority Mr. Riley entered journalistic work in Chicago and finally became connected with the *Prairie Farmer*, the leading agricultural journal of the West. Besides a close application to the duties of his position as reporter, delineator and editor of the entomological department of this paper, he devoted his time and energies to the study of botany and entomology. His industry and versatility soon made him not only popular with his associates upon the paper, but gave him a wide-spread and favored reputation as a writer upon natural history, especially on his specialty of economic entomology, the importance of which he soon made apparent.

During his travels in connection with the *Prairie Farmer*, he became personally acquainted with the leading naturalists and agriculturalists of the West. His connection with the *Prairie Farmer* was interrupted in May, 1864, by his enlistment in the 134th Illinois volunteers, with which he served until its disbanding in November of the same year, when he resumed his connection with the same paper. In the spring of 1868 he terminated his connection with the *Prairie Farmer* to accept the office of "State Entomologist of Missouri," which was tendered to him upon its creation.

The Foundation of his Greatness.

In his new position in Missouri, Prof. Riley found full scope for his peculiar abilities, and soon earned a world-wide reputation as an original investigator and a keen writer, not only on his favorite specialty, but on various practical subjects connected with education and agriculture. Putting heart and soul into his work, he labored for nine years to the credit of his adopted State. With no assistance save what he engaged from his own means; paying all his own expenses, even to the illustration of his reports; contending with much ignorant opposition and ridicule from the Legislature, he yet knew no failure. It was his enthusiasm, born of conviction, and his power of communicating it to others, that enabled him to fight successfully for the cause of economic entomology in a State which had never been noted for advanced ideas.

Of Prof. Riley's published works, those which first gave him prominence are his nine annual reports on the insects of Missouri. In these reports the noxious, beneficial and innocuous insects are treated of in separate divisions. They owe their value in no small degree to the fact that they are replete with the results of original research, and of newly discovered facts in the life histories of most of our common insects, together with practical information for controlling them. Accuracy and popularity are combined in these works, which have come to be looked upon as authoritative text-books, and which are all the more remarkable from the fact that the author had none of the accumulated experience and library facilities to be found in Eastern scientific centers, and had to contend with very inferior State printing and binding.

Of these Missouri reports, the late Charles Darwin wrote that they contained a vast number of facts and generalizations valuable to him, and that he was struck with admiration at the author's powers of observation; while that high authority, the *Entomologist's Monthly Magazine* of London, in noticing the ninth or last report issued, says: "The author, in giving full scope to his keen powers of observation, minuteness of detail, and the skill with which he uses his pencil, and, at the same time, in showing a regard for that scientific accuracy, unfortunately too often neglected in works on economic natural history, maintains his right to be termed the foremost economic entomologist of the day."

Beginning of National Effort.

We all remember the sad experience which our Western States and Territories passed through from 1873 to 1877, from locust or grasshopper ravages, which resulted in destitution and precipitated a financial crisis. These ravages seriously affected the western portion of his own State, and Prof. Riley took hold of the problem with that originality and vigor which have characterized all his work. His last three reports to the State contain the first positive and accurate knowledge on the subject that had been published. But he early saw that the subject was one of national importance, and could not be fully dealt with by work in any one State. To feel a necessity was sufficient for him to act, and consequently we find him, in public lectures, in leading articles, through resolutions offered at society meetings, memorials to Congress, and in every other way, urging the creation of a national entomological commission. After various bills had been introduced and discussed, Congress finally created the Entomological Commission, with a special view to investigate the Rocky mountain locust, or so-called grasshopper; and Prof. Riley was tendered the position of chief of the com-

mission, a distinction which his investigations into this insect had justly earned, for he had already not only made most important discoveries as to its habits and the best means of subduing it, but had ascertained sundry laws that govern it, so as to be able to predict the time of its coming and going and the limits of its spread. Consulted by Secretary Schurz as to the other appointments, it is no wonder that the members chosen were Dr. A. S. Packard, Jr., a naturalist of eminence, one of the first entomologists of the world, and a prominent author and editor, and Prof. Cyrus Thomas, who had likewise labored for the creation of the commission and who was the authority on the family of insects to which the locust belongs. Both of the gentlemen, like Prof. Riley, had been chosen by their respective States as official entomologists, and had a large personal experience in the West. Accepting charge of the commission thus constituted, in March, 1877, we find Riley traveling that year over most of the Western country, from the Gulf to the South Saskatchewan, in British America, now in company with the Governor of a State, again with other special officials, but everywhere exhorting the farmers to action, making careful observations and experiments, and inspiring confidence.

In the spring of 1878, while superintending the publication of the first report of this commission, Prof. Riley was tendered the position of entomologist to the Department of Agriculture by the then Commissioner LeDuc. There was at that time an entomologist provided for at \$1900 per annum, with no assistants or means for efficient work, and little experimental work or original research had for many years been attempted. It was not an inviting position to an ambitious man; but, seeing possibilities for future good work, Prof. Riley accepted it, and Congress gave him \$1000 additional compensation and appropriated \$10,000 for special entomological investigations.

Having already given much attention to the chief insect predators on grain and fruits, he now turned his attention more particularly to those affecting the cotton crop and other Southern staples. But there was lack of harmony in the Department and Prof. Riley resigned his position. Upon his withdrawal, Congress complimented him by transferring the cotton-worm investigation to the Entomological Commission, which acted under the Interior Department. During the next two years—1879 and 1880—he pursued his investigations in the Southern States, during the hottest parts of the year, visiting one State after another and directing and co-operating with his assistants. During this period the commission had its headquarters at his residence, and the bulk of the correspondence fell to his lot. Its success and the increasing support given to it by Congress was due as much to the dignity, tact and courage, as to the efficiency which characterized Riley's management. When LeDuc's administration of the Department of Agriculture came to a close, Riley was again tendered the position of entomologist by Dr. Loring, who knew and appreciated his abilities. Few appointments have, in fact, been more generally demanded or indorsed by the most prominent agriculturists and scientists, whether in their individual capacities or through organizations.

During the early years of his incumbency, Prof. Riley carried forward the work of the Department and of the U. S. Entomological Commission together. The publications of the Commission on the Rocky mountain locust, the cotton worm, etc., are already entomological classics. They present evidences of tireless application, of profound insight into natural phenomena, and of most practical appreciation of the economic aspects of the topics presented. We cannot find space even to properly outline or characterize them.

The Government Work Concentrated.

Prof. Riley foresaw clearly that with a properly organized and supported Entomological Division in the Department of Agriculture, under an appreciative commissioner, there would be no reason for the continuance of the special commission, which was, in fact, transferred to the Department on July 1, 1881, and closed its active labors a year afterward. The organization of the Entomological Division was an original conception of Prof. Riley, and the plan was arranged by him to the smallest details. It is the foremost organization of its kind in the world, and is a credit to the American name. Incidentally Prof. Riley's work has advanced the whole Department of Agriculture, for it is generally conceded that the Entomological Division has led in most matters where efficiency, system and discipline were needed. Commissioner Loring recognized this fact, and showed unreserved appreciation of it. In one of his reports he cited the *regime* of the Entomological Division as one to be imitated, while Prof. I. O. Westwood, the highest living English authority in general and economic entomology, and titular life president of the London Entomological Society, in expressing his admiration of Riley's work in 1883, said: "I am sure it must have had a great share in inducing the activity in entomological work in America, which is quite putting to the blush the entomologists of Europe."

It would take columns of the *RURAL* merely to catalogue the important published works of Prof. Riley since the organization of the Division. He has a large corps of local assistants all doing original work under his direction, and their reports, with his deductions and applica-

tions, supplementing his own most important original studies, which he never for a moment loses sight of, place the entomological literature of America in a position of world-wide eminence. We are obliged to restrict ourselves to this general statement.

During the last four years, as our readers know, Prof. Riley has had much to do with what has been done in promoting silk culture, starting investigations in economic ornithology and in apiculture. It will be difficult to say which are the more important of the original discoveries made; but those made in the last two years with regard to the buffalo gnats of the South, the habits of which were entirely a mystery before, and those with regard to the hop louse (of which we shall soon give a full account), are probably of the most scientific value.

Prof. Riley's Gift to the Country.

Considering the value of Prof. Riley's work in general, it is hard to specify which are the most important contributions to the country. There is one, however, which is not all included in the list of his official duties and must be accepted as signaling his thorough devotion and generous sacrifice of self to the public good. We refer to the gift of his private collection of American insects to the National Museum. It represents the fruits of his own labors in collecting and study for over 25 years, and contains over 20,000 species, represented by over 115,000 pinned specimens, and much additional material unpinned and in alcohol. This generous gift to the Government has long been contemplated by Dr. Riley, whose ambition it is to be, as far as possible, instrumental in forming a national collection of insects, and with the belief that his collection will form an excellent nucleus for future accumulations. This collection contains the following pinned and mounted specimens:

	Boxes.	Specimens.	Species.
Hymenoptera.....	66	24,796	2,650
Coleoptera.....	127	43,513	6,558
Lepidoptera.....	338	17,098	2,308
Diptera.....	21	5,646	699
Hemiptera.....	59	8,862	1,184
Orthoptera.....	64	6,993	560
Neuroptera.....	14	868	169
Arachnida and Myriopoda.....	4	425	110
Insect architecture.....	16	1,080	178
Miscell. (not yet arranged).....	28	1,610	178
Galls and gall insects.....	31	4,152	734
Total, pinned.....	766	115,058	15,328

Foreign Honors.

We have alluded incidentally to the esteem in which Prof. Riley's work is held abroad. If he could be clothed in the medals and tokens of honorary membership in foreign scientific societies which have been awarded him, he would have no need of further tailoring during his natural life. His studies on the grape phylloxera have everywhere been honored. The French Republic marked its appreciation of his discoveries and of his services to French grape culture by presenting him in 1873 with a grand gold medal, designed and cast for the occasion. We may mention also that in 1884 a gold medal was awarded to Prof. Riley by the Scotch authorities for a collection of forestry insects which he made at the International Exhibition in Edinburgh. As the motto on the Edinburgh medal is quaint, it is worth noting. The face has a pretty relief of the city of Edinburgh with castle, Arthur's seat, etc., and "International Forestry Exhibition, Edinburgh, 1884," underneath. The reverse has around the border: "Be aye stickin' in a tree it'll be growin' when ye're sleepin'"; then within a wreath: "Awarded to Prof. Riley, Washington, for collection of insects injurious to forest trees."

Personal.

In personal appearance, Prof. Riley is above the average in height. Of a bilious, nervous temperament, dark complexion, rather spare, he possesses an active organization and unwearying endurance. The face is striking and strong, remarkably mobile, with the ordinary expression rather pensive, serious and concentrated, but beaming with pleasure and humor whenever the Professor is off his work. Socially, he is bright, warm-hearted and sympathetic. Of late years he has shown the effects of overwork, against which his friends and family find it necessary to constantly warn him. He married, in 1878, Miss Emilie G. Conzelman, daughter of G. Conzelman, Esq., a much-respected citizen of St. Louis, who, among other public-spirited acts, was the originator and is one of the chief supporters of the manual labor school connected with Washington University, and which has proved so successful that it is emulated in other cities. Prof. Riley's home, in the northwest part of the city of Washington, is noted for its many pleasant belongings, and particularly for the taste displayed in the garden.

Prof. Riley is yet in the prime of life. No one could fill his place, and thousands of people throughout the land will wish with us that he may yet be spared many years of health and usefulness. With so much accomplished, with so honorable a past, it is difficult to predict his future, or the good he may yet accomplish, for, as he is not yet 44 years of age, it is pleasant to think that his life is but just entering upon its best estate.

We hear so much about the "cattle kings" of Nevada, but why is it nothing is said of the "horse kings"? A man who owns a bunch of horses is as much a king as is the man who claims to be the owner of a herd of cattle. Let us have horse kings.—*Elko Independent*.

Southern California.

[NO. 7.—CONTINUED.]

San Diego County and City.

[Editorial Correspondence.]

Twenty years ago all Southern California was looked upon as a barren desert, fit only for stock ranges and of but little value for even that. Its wonderful capacity for fruit-growing and general agricultural value was hardly suspected. The chief reason of this lack of knowledge as to its true value was the restricted means of communication with other portions of the State. The supposed lack of water and slight rainfall was also considered an effectual bar against any extensive improvements. The only exceptions were a few isolated spots where natural water was available.

These few cases, however, gradually attracted the attention of tourists and others, who found the climate of surpassing excellence and so reported it to the world. This circumstance soon began to attract visitors, mostly invalids, who fully confirmed these reports. In time many of these visitors became permanent residents, and such as were possessed of means and energy began to seek out new fields of enterprise, by introducing artificial irrigation into previously desert localities. Success attended such efforts and a new order of things was gradually developed. Land was abundant and cheap; horticultural and agricultural experiments were a universal success, and the cultivation of the soil soon took the place of the less profitable and less progressive business of cattle and sheep raising.

The well known and observing visitor, Chas. Nordhoff, was the first person of wide reputation who fully realized and confidently predicted the future of Southern California and gave it a world-wide reputation. His writings were published in 1872-73; but it was not until the extension of the Southern Pacific railroad into and through Los Angeles and San Bernardino counties that the really active growth of those counties commenced. The building of this road was soon followed by that of the California Southern from Colton to San Diego, by means of which the "boom" was soon extended to the latter place. The next thing after the advent of the railroad was a united effort to secure an abundant

Water Supply for San Diego

And vicinity. This effort has been most successful and the city now has several water companies which work in harmony. The first is known as the San Diego Water Company, whose chief object is to supply the city. Another has been more recently organized with the special purpose of supplying the Coronado Beach tract, across the harbor, where a new city is growing up, to which we shall refer more fully hereafter. Both of these companies pump water from the San Diego river, some four or five miles above the city. As these two companies will furnish but a limited supply and that chiefly for domestic purposes, another and larger company has been organized which is known as the San Diego Flume Company, who are taking the water from the San Diego river at a point in the mountains some 30 miles above the city, where the supply is abundant all the year round. It will be brought down in a wooden flume six feet wide by four feet deep. At the point where the dam is being built the supply varies from 1500 to 2000 inches in July and August. This flow will be supplemented by several feeders below. This water is designed especially for irrigating purposes, and will furnish water whenever needed from the Cajon valley to the city. As the demand for water increases, extensive reservoirs will be made in the mountains, after the manner of the well-known Bear river reservoir above San Bernardino. The cost of this work is estimated at from \$400,000 to \$500,000. Another very extensive and important water enterprise is in a very forward stage of completion, and intended for supplying water for irrigation and domestic use along the Sweet Water valley and throughout National City and the region of back country adjoining that locality. Of this we shall speak more fully next week. Other enterprises of a similar character will, no doubt, be undertaken in the more northern portions of the county as soon as a sufficient number of new-comers shall locate there to make such investments profitable.

Until the isolation of San Diego was broken up by the advent of the Southern California, which has now become the San Diego terminus of the Atchison & Topeka, but little was known abroad of the county beyond San Diego City and the mines in the distant interior. The coast line gave but little indication of what was beyond it, and to the few who ventured inland, the country, with the exception of two or three little mountain valleys, seemed almost worthless except for grazing and bee pasturage. The numerous streams which found their way from the high mountain ranges, which always kept up their flow from the winter rains and accumulated snow, sank from sight as they approached the lowlands, and their waters found their way to the sea in underground channels of loose granite sand. This fact led to the erroneous conclusion that the county had no means of irrigation—a conviction which was much strengthened by the further fact that much of the arable land of the county was broken into hills and valleys and rolling table-lands. But

the engineering and experience of other parts of the State during the last few years has shown that all such difficulties can be readily overcome. Moreover, experience has shown that the peculiarities of the climate and soil of San Diego county do not require anything like as much water to produce a given crop as does the soil of Los Angeles and San Bernardino counties. Fruit-growers there claim, and consumers acknowledge, that fruit raised with a very small supply of water is much better than that produced on the same land by the use of as much water as is required 100 miles to the north. Good fruit lands in San Diego can be had at a much lower price than similar lands in the two adjoining counties to the north—a fact which will attract many in that direction.

Increase in Population and Wealth.

Notwithstanding the disadvantages, in many points of view, under which San Diego has been placed, it has nevertheless more than kept even pace in increase of population and wealth with the six neighboring counties to the north of it. The census reports of 1880 and 1885 show that San Diego has made a larger proportionate gain in both population and wealth than either Los Angeles, San Bernardino, San Luis Obispo, Santa Barbara or Ventura, during the half-decade between those dates; and that, too, while the more northern counties began with a larger capital in population, and were the earliest to lay aside the business of stock raising for cultivation of the soil and the building up of business centers.

Topography of the County.

The total area of the county is about 9,500,000 acres, of which but little over 750,000 is included in Mexican and Spanish grants, leaving all the balance as public lands. It is an interesting fact to know that nearly all the large grants have been or are being rapidly divided into small holdings, which are being promptly taken up by new-comers. It is estimated that there are about 3,000,000 acres of good arable land in the county, the chief part of which is still unsettled, although the most desirable localities are already occupied.

Two mountain ranges run through the county from northwest to southeast, dividing it into three elongated districts, each possessing marked peculiarities of soil and climate. The section between the mountains and sea is about 80 or 90 miles in length, ranging from 25 to 40 in breadth. It consists chiefly of rolling hills and mesa land, is exceedingly fertile, and nearly all of it will eventually come under a high state of cultivation through artificial irrigation. This region is covered by six principal rivers, and several smaller streams either pass through it or flow from it. Of course the most of these streams are either quite or nearly dry in the summer-time; but, as already said, their waters may be taken up at points just above the foothills, and whatever escapes or finds its way into those streams below these points may be largely utilized by being pumped up from wells near the river-banks, at any place along their course from the foothills to the sea. All this region is capable of the highest degree of cultivation and now comprises fully three-fourths of all the population of the county.

The Middle Division of the County.

Lying between the two ranges of mountains alluded to, comprises numerous broad and fertile valleys, which furnish an abundance of good pasturage all the year round. These valleys are now being rapidly taken up and improved as arable lands, and in some of them thriving towns are growing up, with every indication of a large future increase and permanence. The rapidity with which the series of valleys along which the California Southern railroad finds its way is being filled up is quite a marvel. When that road was constructed, some four or five years ago, the most of these valleys had every appearance of a barren desert, forever given over to cattle and sheep. But with the advent of the road has also come the settler with his plow and cultivator. When the writer first passed through these valleys, just after the road was completed, scarce a house was to be seen, or a cultivated field or garden. While passing over the same road a few weeks since, towns and villages were passed every few miles. Fine hotels have been built for the accommodation of travelers and residents, vineyards and orchards are seen all along the route through the valleys, until the locomotive enters the canyon through which it winds its mountain way to the coast. Everything betokens the enterprise and thrift born of the railway and capital and energy of the new, industrious comers. The natural resources of this portion of the county are scarcely inferior to that which skirts the seaboard, and it is capable of supporting a very large population. The cereals and all the fruits of temperate regions grow here to perfection. But little has as yet been done with citrus fruits here, but experiments are in progress which will most undoubtedly prove that this region has large capabilities in that direction also. The apple, cherry and plum are especially at home in this section of the county.

The Third Division

Of the county, or, as it has sometimes been termed, "the desert division," lies east of the second or San Jacinto range of mountains. The Southern Pacific railroad passes through this section, within which is the famous desert valley, about 75 miles long by 20 to 30 broad, where the locomotive pushes its way along the central line of the valley, at one point reach-

ing, it is said, a depression of 500 feet below the level of the sea! At the head of this remarkable depression the peak of San Jacinto rises, precipitously, to an elevation of 9000 feet above the sea—overlooking, with its snow-crowned summit, all the great valleys above alluded to, as well as those of San Jacinto, San Bernardino, and the upper portion of the San Gabriel valley.

San Diego Bay and Harbor

Has been known to the world for centuries, and San Diego City for the last hundred years. It is the only harbor worth the name in California south of San Francisco, and is third in the possibilities of its extent and commerce in the Union. For safety and ease of entry it may be classed as the first. It is now connected with the great system of continental railroads, and many mighty hopes have been ventured in regard to its future destiny and that of the great city which is rapidly growing up all along the 12 miles of its eastern front. It requires no prophetic eye to predict that the time will soon come when that city and harbor will become a place of great commercial importance. Whether it will seriously affect the growth of San Francisco in regard to its Asiatic and overland commerce, time alone must determine. That it will secure a portion of such traffic is already a foregone conclusion. Negotiations are, at this very hour of writing, in progress to make San Diego the terminus of a line of steamers across the Pacific. If such an enterprise is not accomplished at this date, there can be no doubt but that time will insure it at an early day. San Diego has been for many years under the influence of an apparent nap; but all that time there have been a few hopeful, active and energetic citizens, led on and encouraged by the indefatigable brothers Kimball of National City, who have never given up hope, have never ceased for a moment in their determined purpose to build up a great city on this magnificent harbor. The fruition of their hopes has now been realized, and the work of building is now going on with constantly accelerated energy. Local roads are being built and projected in every direction to develop the immediate surroundings of the growing city. Wharves are being built to accommodate the rapidly increasing shipping. Little centers of business are being constantly started all along the water-front, all of which are destined at an early day to be merged into one grand emporium of commercial business, which will take its place among the great cities of the world and pass into history to continue and increase as long as railroads traverse the earth or sail and steam find their trackless paths across seas and oceans. W. B. E.

Frightful Waste.

Consumption carries off its thousands of victims every year. Yes, thousands of human lives are being wasted that might be saved, for the fact is now established that consumption, in its early stages, is curable. Dr. Pierce's "Golden Medical Discovery" will, if used in time, effect a permanent cure. It has no equal as a remedy for bronchitis, coughs and colds. Its efficacy has been proved in thousands of cases. All druggists.

"Be wise to day; 'tis madness to defer." Don't neglect your cough. If you do your fate may be that of the countless thousands who have done likewise, and who to day fill consumptives' graves. Night-sweats, spitting of blood, weak lungs, and consumption itself, if taken in time, can be cured by the use of Dr. Pierce's "Golden Medical Discovery." This wonderful preparation has no equal as a remedy for lung and throat diseases. All druggists.

The huge, drastic, griping, sickening pills are fast being superseded by Dr. Pierce's "Purgative Pellets."

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

"DON'T SEE HOW ANY ONE CAN DO WITHOUT IT."—We see that our friend Edmund Wright has secured the agency for the PACIFIC RURAL PRESS—emphatically the farmers' and horticulturists' organ on this coast. At this time of general awakening to the importance and advantages of fruit culture, we should think Mr. Wright would find no difficulty in obtaining hosts of new subscribers to that excellent paper—for we don't see how any one engaged in that line can afford to do without it.—Red Bluff Sentinel, July 2, 1887.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

Late Fashions.

Ladies' Oostume.

The fashionable combination of velvet and cotton dress goods is here achieved in the costume, the cotton fabrics being plain and embroidered batiste. The skirt, being shaped in the popular four-gored style, hangs gracefully and may be worn with or without a bustle and steels. On either side of the gores are two flat

the edge of the skirt and are smoothly fitted at the belt. The back drapery is made *bouffant* over the bustle by two deep, downward-turning plaits in each side edge near the belt, and falls straight below even with the edge of the skirt.

A double-pointed vest of the embroidered goods is visible between the cutaway edges of the fronts, which flare toward the bottom and do not meet at the throat. Long lapels of vel-

Fig. 2-LADIES' HAT.

Fig. 3-CHILD'S CAP.

Fig. 1-LADIES' COSTUME.

panels that are finished with wide hems down their front edges and sewed to the skirt along the back of the hems, the panels farthest back overlapping the others the width of the hems. As the hems are sewed visibly, the effect of plaits is realized. The front gore is of the embroidered goods and is revealed between the front panels, which are rendered decorative by a row of embroidered batiste edging applied to turn forward from beneath the hem of the overlapping panels. The panels fall even with

vet turn over the front edges of the fronts all the way down and are broad above the bust and taper narrowly below. Three long button-holes simulated with fine cord decorate the top of the lapels, and, extending slightly above them on the basque, are terminated under three pretty buttons. The basque is adjusted by well-curved darts and seams, and the vest is sewed underneath to the fronts along the first bust darts and flatly above. The vest is closed invisibly with hooks and loops, which are ar-

ranged to alternate on each side. The side seams terminate below the waist-line, but all the other seams are continued in their curves to the edge, and to the lower edge of the front at either side is joined an ornament of velvet that is continued across the side nearly to the side-seams, turned up on the outside and caught like the top of the lapels to the basque with three simulated button-holes of fine cord and three buttons. The ornaments are narrow at their tops and are tacked to place at their upper corners. The standing collar is of velvet, and a bar-pin is fastened at its ends. A linen collar is also worn. The coat-sleeves are trimmed at their wrists with deep, round cuffs of velvet, over which at the bottom turn shallow cuffs of the silk that flare at the back of the wrists. A button on the shallow cuffs and a simulated button-hole of cord extending from it upon the velvet cuff complete the decoration in harmony with the other parts of the basque.

Combinations of all kinds may be developed in a costume of this style, velvet being stylish with all goods, whether of cotton, silk or wool texture. Embroidered and plain chambrays, pongees, batiste, etc., also checked, plaided and striped fabrics combined with plain materials, make up well in this way.

The rough straw hat is trimmed with soft silk and ribbon.

Ladies' Hat.

This hat—a shape familiar and fashionable, because it is comfortable and suited to the street—is of light-brown straw. Around the crown [at its base is draped a Roman scarf, showing many faint colors in contrast. In front, and extending far over at each side, are yellow coreopsis with brown hearts, sprays of foliage and grass coming out from their midst. The effect is very artistic, and it is commended to the amateur milliner, because of the ease with which the trimming may be arranged. Mignonette, roses, violets or pansies may be substituted for the coreopsis, but certainly nothing will be more effective.

Child's Cap.

The puffed portion of this dainty little cap is made of fine, plain muslin, and its oval crown is of embroidered muslin. They are both arranged on a lining of thin muslin, which is cut enough smaller to produce the desired effect and comfortable fit. The edge is defined and the small face framed by three tiny ruffles of Valenciennes lace arranged one above the other. The broad ribbon ties are of pale blue and are looped under the chin; in the back is a prim-looking little bow which gives the little one a very picturesque appearance.

DRESS REFORM.

Equipoise Waste.

A Corset and a Cover Combined.

Union Underflannel. Ready Made and Made to Order. The Perfect Corder Corset, all colors, for ladies and children; button or steel front. Skirt and hose supporters for ladies and misses. All styles of bustles. Corsets ready-made and made to order. Send for Illustrated Catalogue and price list.

MRS. M. H. OBER, 332 Sutter Street, San Francisco.

HALL'S SARSAPARILLA

Cures all Diseases originating from a disordered state of the BLOOD or LIVER. Rheumatism, Neuralgia, Boils, Blotches, Pimples, Scrofula, Tumors, Salt Rheum and Mercurial Pains readily yield to its purifying properties. It leaves the Blood pure the Liver and Kidneys healthy and the Complexion bright and clear.

SCALDS and BURNS

Should have prompt and proper care or they may prove very dangerous and perhaps FATAL.

ACCIDENTS

are constantly happening. A kick of a horse or cow may cause

a bad bruise; the slip of an axe or knife may result in a Serious Cut.

Any of these things may happen to one of YOUR family at any moment.

Have you a bottle of PERRY DAVIS' PAIN KILLER ready for use in such cases? It has no equal for the cure of Scalds, burns, cuts, swellings, bruises, sprains, sores, insect bites &c.—All Druggists sell it. PERRY DAVIS & SON, PROVIDENCE, R.I.

OSTRICHES.

Having a few more of these valuable birds than I have room for on my farm, I will sell, at a very moderate price, three or four pairs. They were all chosen by me in Africa with great care, and are of the best stock.

These birds require little care and will do well in almost any part of California; two acres of ordinary grazing land will keep one pair through the year. The feathers—a seven-monthly crop—yield a large return on the outlay, and the number of chicks obtained from a pair averages from five to twenty a year.

For further particulars, address

DIVIDEND NOTICE.

The German Savings and Loan Society.

For the half year ending June 30, 1887, the Board of Directors of the German Savings and Loan Society has declared a dividend at the rate of four and thirty-two one-hundredths (4 32-100) per cent per annum on term deposits and three and sixty one-hundredths (3 60-100) per cent per annum on ordinary deposits, payable on and after the 1st day of July, 1887. By order.

GEO. LETTE, Secretary.

Fruit Rates for the East.

The Southern Pacific issued July 14th a circular giving full information relative to the special fast-train service, as well as the rates, etc., that obtain for cars sent forward by passenger trains. The following table shows the rates in full, those to New York and Boston not having before been made public:

From points on the Pacific system of the Southern Pacific.	B Freight Pass.	Train.
Omaha, Council Bluffs, Kansas City, Houston and San Antonio, Chicago, St. Louis, New Orleans, St. Paul and Minneapolis.....	\$1 10	\$2 10
New York (Jersey City delivery) and Buffalo.....	1 25	2 50
Boston, Mass.....	3 12½	3 22½

Conditions.

The rates quoted are, as usual, per 100 pounds, and to intermediate points, or points common with those named above, rates by freight train will be the same. The passenger rates will apply only to the points named, or to points intermediate on the line, by which the fruit is carried. The ten-car train rates are as follows: To Omaha, Council Bluffs or Kansas City, \$1275 per train; to Chicago, St. Louis or points common therewith, St. Paul and Minneapolis, \$1500 per train. These charges are for trains of ten cars; if more than ten are offered, each additional car is charged extra as follows: To Omaha and common points \$85; Chicago and common points, \$100. A few other points mentioned in the circular are also of considerable interest to shippers—one of these is that when special trains to Missouri river contain five cars or less destined to Chicago or other through point, each car so destined will be charged regular freight-train rates if run east of the Missouri river by freight train, or 18½ cents per 100 pounds additional if by passenger train. Another rate is that made on trains of ten cars for New York, on which a rate of \$2 per 100 pounds is given, with the additional liberty of dropping five carsloads at Chicago.

Where Rates Do Not Apply.

The rates named, however, it will disappoint the Capay valley farmers to learn, do not apply from points on the Vaca Valley & Clear Lake railroad, the Sacramento & Placerville railroad and the northern division of the Southern Pacific. The carriers will not run in special fast-train cars loaded in excess of 22,000 pounds. The special-train service is open to any corporation, person, firm or firms acting in concert, who, on a given day at Sacramento or other shipping point, engage the requisite number of cars. The expedited service, however, will be treated as a unit, and no cars will be taken into a train without consent of the party or parties acting together who have engaged and made up said train. Fruit, by passenger train, can only be taken when carriers furnish cars properly equipped.

The Board of Forestry.

An informal session of the State Board of Forestry was held Tuesday, Commissioners Bettner and Kinney being present. The following resolution was adopted:

WHEREAS, The annual cutting, waste and destruction by fires of the forests of the United States is enormous, and the renewal of tree growths practically nothing; and whereas, the Government land laws are totally inapplicable to forest lands, giving neither protection to the public domain nor to the legitimate lumber industry, these laws are naturally evaded, and entries under them have been fraught with fraud and perjury. To carry on the lumber industry at all, fraud is nearly a necessity. Besides these defects the land system in relation to forests makes no provision for a continuous supply of timber, nor does it give any attention to the necessity of preserving a due proportion of forest, for the maintenance of springs and streams and climatic conditions favorable to agricultural labor.

Whereas, The State Governments are even more remiss in their treatment of the State school lands (Secs. 16 and 36) in every township, the result of which neglect is that fires devastate these lands, and timber thieves cut and carry off the lumber and wood without let or hindrance, to the loss of the State school funds; therefore, be it

Resolved, That the State Board of Forestry, through its representative at the next National Forestry Congress, will impress upon that body the importance of urging upon the National and State Governments the great necessity for withdrawing Government timber lands and State school timber lands from sale and sale, and the establishment of a system for entry of timber alone under provisions insuring the protection of young growth and the renewal of the forests as fast as cut.

It was also decided to receive proposals for the use of tracts of land of the south, central and north sections of the State for experimental tree planting. These tracts are to be placed under the absolute control of the board for a certain term of years, and proposals will be received for the laying out of these tracts as parks to be used for the recreation of the public.

ROGUE RIVER "COURIER."—The last issue of this paper has the salutatory of A. A. Allworth, the new editor and publisher. We have known Mr. Allworth for a number of years as a good writer and full of skill and energy in journalistic work. He has gone to a very important field, and we have no doubt his labors will be very effective for the development of the country and acceptable to the community.

Cold Storage for Fruits.

Our readers have heard much of the Allegretti process for fruit storage. The application of it is making progress. At San Jose, as has been stated, a small establishment has been built for Mr. Leib. Results of trials of it with different fruits, according to the reports in the *Santa Clara Valley*, have been quite satisfactory, and the building of a large establishment is being agitated. In another column may be found a notice from the Allegretti Storage Company showing that the West Berkeley establishment is now ready to receive fruit on storage. We hope fruit-growers generally will avail themselves of the opportunity to test the process practically and thus get data for larger operations in the future if the results warrant them.

A DEBRIS SUIT.—Mr. George W. Hancock, the well-known agriculturist of Sacramento, has brought suit against H. S. Byam, a hydraulic miner, for injury done to his fine farm on the Cosumnes river by wash and deposit of debris, the result of the mining operations of the defendant. Mr. Hancock claims that before hydraulic mining began the river ran between well-defined banks, the water was good for domestic use, but now his meadow lands have been plowed by torrents, his alfalfa ruined, young orchards defaced and trees killed, he has been put to the expense of leveeing, and the water is rendered offensive. Mr. Hancock's complaint seems to fall within the principles laid down as prevailing, and which would render the defendant liable for the injury.

THE "RURAL" ABROAD.—The RURAL PRESS goes to the uttermost parts of the earth, for interest in Californian agricultural practices and progress extends even to such limits, and the RURAL is sought for its great amount of practical information in this line. One of our subscribers on the other side of the globe, sending money for renewing subscription, writes: "We are pleased to state that the papers reach us with the greatest regularity." It will be for the benefit of the RURAL and of the State to have our circulation extended as far as possible abroad, and we shall be obliged to any friend who will commend our journal to foreign correspondents who may be seeking information about California agriculture.

ONE of our readers and correspondents writes: "I hope your contributor on astronomy will continue his good work. A popular treatment of astronomy, unburdened with the misleading and unnatural figures of lions, bears, centaurs, and virgins, is certainly needed, and must interest not only the young, but some old ones like myself."

A LARGE number of sheep died out of the flock of 3000 that has been feeding on Mount Davidson, from the effects of some herb, probably wild parsnip. The carcasses attracted half a dozen buzzards, who may be seen daily hovering over the mountain. Many have mistaken them for eagles.—*Report.*

C. P. BAILEY, the California Angora goat raiser, has sheared 23,000 pounds of mohair this year. A large band of his goats range in the hills south of Lewis, Lander county, Nevada.—*Elko Free Press.*

IMPORTATIONS from Mexico in the Paso del Norte district, during the last fiscal year, show a great falling off, especially in wool and cattle.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 210 Market St., S. F.

FOR WEEK ENDING JULY 12, 1887.

366,291.—CORN AND CANE CUTTER—Jos. Al-
bertson, S. F.
366,444.—PILE COVERING—H. Anderson, S. F.
366,311.—FOLDING BED—B. F. Farrar, S. F.
366,312.—MATTRESS—B. F. Farrar, S. F.
366,320.—MINERS' CANDLESTICK—D. B. James,
S. F.
366,411.—WASHING MACHINE—H. Lawrence,
Salem, Oregon.
366,328.—METALLIC LATHING—D. P. N. Little,
S. F.
366,641.—PILLOW-SHAM HOLDER—R. X. Mc-
Arthur, Tacoma, W. T.
366,237.—FAUCET AND GAS VALVE—C. C. Mor-
ris, S. F.
366,343.—CARGO-DISCHARGING APPARATUS—
Sam'l Murray, S. F.
366,242.—TRAVELING THRASHER—J. Parnell,
Grayson, Cal.
366,253.—REGISTERING TAG—M. Raphael, Port-
land, Oregon.
366,434.—BUNG—O. Sowers, Santa Rosa, Cal.
366,355.—DRUM ATTACHMENT—W. H. Travis,
San Jose, Cal.
17,440.—BADGE DESIGN—Chas. Hadenfeldt,
S. F.
14,591.—TRADEMARK—Webster & Sargent,
Minturn, Cal.

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

At Anderson Springs,

Middletown, Lake Co., the proprietors are enjoying a season of unusual prosperity. The guests have been numerous, contented, and in fact, delighted. The place seems steadily improving and increasing in popularity. It is the nearest to S. F. of all the delightful and healthful pleasure resorts in Lake county, being reached in eight hours by a beautiful ride to Oakland, along the bay shore, across the straits to Vallejo, through the delightful Napa valley and over the base of Mt. St. Helena into a luke-warm valley.

Among the late arrivals were: Mr. Vincent O'Brien, Oakland; Mr. Thos. F. Connolly, Mr. D. E. Josephi, Mr. R. E. Houghton, San Francisco; Mr. J. P. Garlich, Oakland; Mr. C. M. Young, Guenoc; Mr. and Mrs. Cot-trell and family, Mr. Coburn, Lake county; Mr. and Mrs. Willis Whitmore, Mr. Garvin, Oakland; Mr. McKenzie, San Francisco; Mr. M. G. Meagher, Vallejo; Mrs. P. McCann and son, Portland; Mr. and Mrs. Henry Connolly and daughter, Vallejo; Mr. H. H. Garrett, Calistoga; James Quigley, New York; Miss Fannie Quigley, Mrs. F. Bollum, Mrs. Ghermins, San Francisco; Mr. George McCormick, Mr. and Mrs. Giddings, Tulare; Mrs. F. Bellum and daughter, San Francisco.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

JARRED C. HOAG—California.
G. W. INGALLS—Arizona.
GEO. McDOWELL—San Luis Obispo Co.
J. L. DOYLER—Amador Co.
W. J. FREEMAN—Nevada.
WILLIAM POOL—Fresno Co.
M. S. PRIME—Alameda Co.
R. G. HUSTON—Butte, Montana.
E. P. SMITH—Humboldt Co.
EDMUND WRIGHT—Tehama Co.

SAN DIEGO COUNTY.—We are indebted to F. R. Wetmore & Co., real estate agents of San Diego, for an interesting budget of local papers and a pamphlet on the "Resources of the County," by Mr. Douglas Gunn of the Union.

We learn that Mr. G. G. Baker of this city and former secretary of Haines Bros., publishers of Chicago, has connected himself with the Japanese Tree Importing Co., and will continue to reside in this city.

THE STATE BOARD OF HORTICULTURE will remove, the 1st of August, to new quarters in the Hayward building, No. 220 Sutter street, S. F., where greater facilities will be afforded for the information of the public. The library is to receive large additions. On a bulletin-board will be displayed horticultural dispatches from all parts of the State, detailing the condition of crops, amount of shipments, etc., and arrangements have been made for daily telegrams from the California Fruit Union at Sacramento, and the Orange-growers' Protective Union of Southern California.

Enterprise Windmills.

Messrs. Horton & Kennedy of Livermore have been in the windmill business for many years, and are constantly endeavoring to furnish the people of this coast with the best that money and experience can produce. The firm is reliable and ready to give the facts on which they base their claims of superiority. Address, Horton & Kennedy, Livermore, Alameda Co., Cal., or Jas. Linforth, 120 Front St., S. F.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish, to those who pay fully one year in advance of date, if requested the following articles (while this notice continues), at the very greatly reduced figures named at the right:

- 1.—The Agricultural Features of California, by Prof. Hilgard, 138 large pages, illustrated, cloth, with colored maps (full price \$1).....\$0 25
- 2.—World's Cyclopaedia, 794 pages, 1250 illustrations; (exceedingly valuable).....50
- 3.—Dewey's Patent Elastic Binder (cloth cover), name of this paper stamped in gilt.....50
- 4.—Niles' Stock and Poultry Book for Pacific Coast, pamphlet, 120 pages, illustrated.....25
- 5.—Kendall's Treatise on the Horse and Diseases, 89 pages, instructive illustrations.....05
- 6.—To New Subscribers, 12 select back Nos. of the RURAL PRESS, "good as new".....Free
- 7.—Any of Harper's, Frank Leslie's and most other first-class U. S. periodicals, 15 per ct. off regular rates, except special publications, we can usually give 10 to 15 per cent off advertised retail rates.
- 10.—March of Empire, by Mallie Stafford.....25
- 11.—Life Among the Apaches, 322 pages, stiff cloth.....25
- 12.—\$1 worth of choice seeds, to be selected from a list of 107 flower and 82 garden seeds, as previously published, or which list we will send on application.....25
- 14.—Dewey's Pat. Newspaper Fileholder (18 to 36 in.).....25
- 15.—European Vines Described, 63 pages.....05
- 19.—Webster's Dictionary, 634 pages, with 1500 illustrations; very handy and reliable.....50
- 23.—Architecture Simplified, 60 pages.....05
- 24.—Mother Bickerdyke's Life with the Army; patriotic and ably written; 166 pp., cloth, \$1.00.....50
- 25.—Ropp's Easy Calculator, cloth, 80 pp.....25
- 26.—How to Tell the Age of a Horse.....05
- 27.—Percheron Stud Book—French—bound in leather, 192 pages (full price, \$3).....1.00
- 28.—What Every One Should Know; a cyclopaedia of valuable information; 510 pp.; cloth; (full price \$1).....50
- 29.—Knitting and Crochet, by Jennie June; 144 pp., 200 illustrations.....25
- 30.—Needle Work, by Jennie June; 126 pp., 200 illustrations.....25
- 31.—Ladies' Fancy Work, by Jennie June; 152 pp., 700 illustrations.....25
- 32.—The Way to do Magic; illustrated, 60 pp.....10
- 33.—The Taxidermist's Manual; illustrated, 64 pp.....10

Beautiful Poetic Review, entertaining and instructive; 35 pages (a handsome and pleasing present).....25

NOTE.—The cash must accompany all orders. Address this office, No. 252 Market St., S. F.

Inform your neighbors about our offers and paper.

FAMOUS
ENTERPRISE

Self-Regulating

WINDMILL

is recognized as
THE BEST.

Always gives satisfaction. SIMPLE STRONG and DURABLE in all parts. Solid Wrought-iron Crank Shaft with DOUBLE BEARINGS for the Crank to work in, all turned and run in adjustable babbitted boxes.

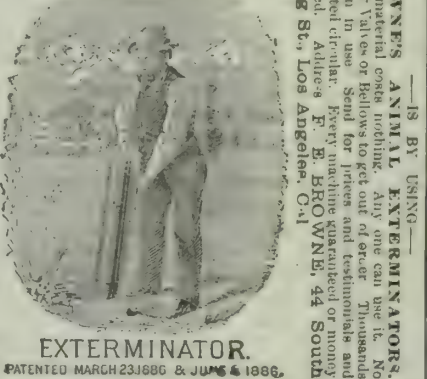

Positively Self-Regulating.

With no cone springs, or springs of any kind. No little rods, joints, levers, or anything of the kind to get out of order, as such things do. Mills in use 8 to 12 years in good order now, that have never cost one cent for repairs. All genuine Enterprise Mills for the Pacific Coast trade come only through this agency, and none, whether of the old or latest pattern, are genuine except those bearing the "Enterprise Co." stamp. Look out for this, as inferior mills are being offered with testimonials applied to them which were given for ours. Prices to suit the times. Full particulars free. Best Pumps, Feed Mills, etc., kept in stock. Address,

CHICAGO VETERINARY COLLEGE

Facilities for teaching and clinical advantages unsurpassed. Regular winter session for 1887—1888 commences October 1st. For prospectus and further information, address the Secretary, JOSEPH HUGHES, M. B. C. V. S., 2587 and 2589 State Street, Chicago, Ill.

THE STATE FAIR

At SACRAMENTO, Cal., Sept. 12 to 24, 1887.

\$2000 in Cash for County Exhibits.

SPECIAL ATTENTION OF THE FARMING COMMUNITY

Is called, as well as the various Immigration Societies, Boards of Trade of the several Counties, and all others interested in bringing out the resources of their respective Counties, to the advantages offered by an Exhibition at the

STATE FAIR

Of the varied products of their counties. The supervisors of each county are invited to make a liberal appropriation, sufficient to pay the expenses of getting together an Exhibition of County Products. Premiums received can be returned to the treasury of each county making the appropriation, so that their respective counties would be written up and advertised at a small expense by an exhibition of this character. The Railroad Company transports the same free of charge.

THE LIVE STOCK EXHIBITION, connected with the State Fair, is sure to attract Eastern visitors anxious to view the resources of California.

APPLY FOR SPACE AT ONCE, as the Society is willing to devote the entire exposition building, if necessary, to displays of CALIFORNIA PRODUCTS. A NEW FEATURE has been added to the Premium List this year, in the shape of awards for a Sheep Display of Cereals. Forty Sheaves, not less than 10 inches in diameter, of 10 varieties of grain are called for. Not necessary to be grown by exhibitor. Notice is now given that samples may be gathered during harvest, and laid away for exhibition. Address the Secretary for Premium Lists and other information.

EDWIN F. SMITH, Secretary.

THE DOG In health, habits and disease. All breeds and treatment; 50 cuts; 25c. This office.

Lands For Sale and To Let.

Glen Cove Rancho for Sale.

This Rancho is situated at tide-water on the north shore of the Straits of Carquinez in Solano County, and comprises about 415 acres of good grain land. It is fenced and cross-fenced with five-board fence, and is well calculated for fruit raising. Has a young orchard of upward of 700 trees now well started; also a vineyard of 7000 vines of wine-producing grapes. The improvements consist of a large barn covering an area of 30x60, with 15-foot stables on either side; also a warehouse 30x60 for storing grain (with wharf) at tide-water, thus saving the expense of hauling grain for shipment. A wagon-house, a conservatory, sheds for storing machinery, hen-houses and inclosed yards, with a modern-built, two-story house with mansard roof and cellar under the whole structure, resting on an 18-inch stone wall; has 15 large, fine rooms, hard-finished walls, furnished with hot and cold water from two large cisterns and a spring upward of 100 feet above the house. Has a fine garden and pleasant surroundings; is about 30 miles from San Francisco and four miles from Vallejo or Benicia, with good roads by land and a pleasant sail by water. The prospective railroad from Santa Rosa to Benicia is expected to pass directly in front of the place, and a flag station is promised by said railroad company. The soil is of a rich loam and very deep. In point of health and climate no section of the State can surpass it. The live-stock and the farming implements will be sold, if desired, at very low figures. A rare opportunity is offered for any one who wants a very desirable place at a very favorable price. For further particulars apply on the premises or address, JOHN F. DEMING, Vallejo, Solano Co., Cal.

REAL ESTATE FOR SALE.

Edwin K. Alsip & Co.
(Established 1860)

A Treatise on the Horse and his Diseases

By R. J. KENDALL, M. D.

85 Fine Engravings showing the positions and actions of sick horses. Gives the cause, symptoms and best treatment of diseases. Has a table giving the doses, effects and antidotes of all the principal medicines used for the horse, and a few pages on the action and uses of medicines. Rules for telling the age of a horse, with a fine engraving showing the appearance of the teeth at each year. It is printed on fine paper and has nearly 100 pages, 7x5 inches. Price, only 25 cents, or five for \$1, on receipt of which we will send by mail to any address. DEWEY & CO., 320 Market St., S. F.

ALWAYS AHEAD!
\$35. Golden State \$35.
WINDMILL.

\$35.00 CASH.

Has stood the severest tests of practical use for many years. It is STRONG, DURABLE,
SELF-REGULATING, STORM-DEFYING. Requires less wind than any other Mill, and embraces all
the latest improvements. It has the shortest shaft and is the best balanced Mill ever made.
The frame, or rims, of the wheel are bent, material used in their construction being the
best. There is no simpler or more perfect self-regulator made.

Runs in the Lightest Wind.
Defies the Fiercest Storm.
Never Blows Down.
Always in Order and Ready for Use.
Any Farmer Can Repair it.
You Will be Delighted.
It is low in Price—only \$35 Cash.
You buy your Mill from the manufacturer.

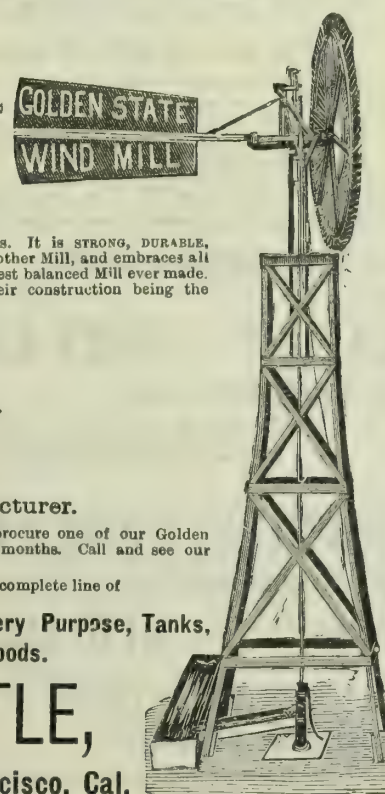

Should a farmer be without a Windmill when he is able to procure one of our Golden
State Mills for \$35 cash? You will save the cost of Mill in six months. Call and see our
mill that costs but \$35 cash, or send for circular.

Send for our Special No. 14 Catalogue. We carry the most complete line of

Windmill Force Pumps and Pumps for Every Purpose, Tanks,
Pipe, Pipe Fittings, Brass Goods.

ORANGE, LEMON & LIME TREES

FOR THE SEASON OF 1888.

Having the exclusive Agency of the Pacific Coast for the extensive Nurseries of A. Wimberly and A. J. Bach & Son, of Palatka, Florida, we are prepared to furnish Orange, Lemon and Lime Trees of all the leading varieties (budded on seedling stocks) in any quantity desired, from one tree to ten thousand,

AT PRICES THAT ALL CAN AFFORD TO PLANT.

These Trees are all first-class, 3 feet and upward in height and three-fourths of an inch and over in diameter at base of bud.

It will be necessary to give your order early to secure prompt delivery. Special prices given for carload lots. Write for prices or any information desired. Address

C. W. REED & CO.,
SACRAMENTO, CAL.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

Dr. J. Kobbie—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid	12.90 per cent
Inverted Phosphoric Acid	.35 "
Insoluble Phosphoric Acid	2.83 "
Potash	2.23 "
Ammonia	1.87 "
Nitric Acid	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,

DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

Dr. J. Kobbie, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1 pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sobranto, Station of the O. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

The Genuine is manufactured only by

J. J. APPLGATE,

No. 12 Bush Street, San Francisco.

HEADQUARTERS FOR ALL KINDS OF BALING PRESSES —AND— HAYING TOOLS.

THE MONARCH, JR., HAY PRESS.

IMPROVED FOR 1887.

Any young man can earn more on an investment of \$500 in this press than can be earned in expending \$3000 for any other machine. We have a Monarch Press, which we sell for \$600, but have been used a very little and is just as good as new, which we will sell for \$450.

THE CLIMAX HAY PRESS, \$300.

Weight, 2200 lbs. A crew of three men—four can be used to advantage.

Five ropes are used on the bales. Capacity, 10 to 15 tons per day. The best press for the money in the world.

The Celebrated Petaluma Baling Press.

Weight, 2600 lbs. Price, \$350, delivered at the factory. Size of bale, 22x48 inches. Capacity, 20 tons per day. Weight of bale from 225 to 400 lbs. This remarkable machine still stands at the head of all vertical baling presses, and probably bales three-quarters of all the hay west of the Rocky Mountains.

Whitman's IMPROVED New Rebound Plunger.

GREATLY IMPROVED FOR 1887.

Do not confound our New Press with that made two years since. EVERY PRESS FULLY WARRANTED. For one or two horses. The most powerful in use. The most rapid and durable, and the most perfect. Makes the most perfect bale. The most simple to operate. Least expense for repairs. NO STOPS FOR TYING BALE.

The Greatest Success of the Age.

Victorious in every contest. Double-acting, with new concentrating power. Do not buy a Press until you have seen the IMPROVED New Whitman with concentrating power. Puts from 10 to 15 Tons in a Car.

16x18 Mounted, weight, 3600 lbs. \$400 00
18x22 Mounted, weight, 3900 lbs. 450 00
All make bales of variable size.

Hay Forks, Hay Carriers, Harpoon Forks, and all kinds of Haying Tools in great variety. In baling your hay, use our Steel Baling Ties. Cheaper than Wire—Better than Rope.

TRUMAN, ISHAM & HOOKER,
421—427 Market Street, San Francisco.

THE BUYERS' GUIDE is issued Sept. and March, each year. 64-312 pages, 8 1/2 x 11 1/2 inches, with over 3,500 illustrations—a whole Picture Gallery. GIVES Wholesale Prices

direct to consumers on all goods, for personal or family use. Tells how to order, and gives exact cost of everything you use, eat, drink, wear, or have fun with. These INVALUABLE BOOKS contain information gleaned from the markets of the world. We will mail a copy FREE to any address upon receipt of 10 cts. to defray expense of mailing. Let us hear from you. APPLEGATE'S

Cold Water Bleaching Soap

Was Awarded the First Premium at the State Fair at Sacramento, for the year 1886, UPON ACTUAL MERIT. It can be used in Bath, Toilet or Laundry, and dispenses with Fuel, as no Warm Water or Boiling is Necessary. Beware of Cheap Imitations.

The Genuine is manufactured only by

J. J. APPLGATE,

No. 12 Bush Street,

San Francisco.

HEADQUARTERS FOR ALL KINDS OF BALING PRESSES —AND— HAYING TOOLS.

THE MONARCH, JR., HAY PRESS.

IMPROVED FOR 1887.

Any young man can earn more on an investment of \$500 in this press than can be earned in expending \$2000 for any other machine. We have a Monarch Press, which we sell for \$800, but have been used a very little and is just as good as new, which we will sell for \$450.

THE CLIMAX HAY PRESS, \$300.

Weight, 2200 lbs. A crew of three men—four can be used to advantage.

Five ropes are used on the bales. Capacity, 10 to 15 tons per day. The best press for the money in the world.

The Celebrated Petaluma Baling Press.

Weight, 2600 lbs. Price, \$350, delivered at the factory. Size of bale, 22x22x48 inches. Capacity, 26 tons per day. Weight of bale from 225 to 400 lbs. This remarkable machine still stands at the head of all vertical baling presses, and probably bales three-quarters of all the hay west of the Rocky Mountains.

Whitman's IMPROVED New Rebound Plunger.

GREATLY IMPROVED FOR 1887.

Do not confound our New Press with that made two years since. EVERY PRESS FULLY WARRANTED. For one or two horses. The most powerful in use. The most rapid and durable, and the most perfect. Makes the most perfect bale. The most simple to operate. Least expense for repairs. NO STOPS FOR TYING BALE.

The Greatest Success of the Age.

Victorious in every contest. Double-acting, with new concentrating power. Do not buy a Press until you have seen the Improved New Whitman with concentrating power. Puts from 10 to 15 Tons in a Car.

16x18 Mounted, weight, 3600 lbs. \$400 00
18x22 Mounted, weight, 3300 lbs. 450 00
All make bales of variable size.

Hay Forks, Hay Carriers, Harpoon Forks, and all kinds of Haying Tools in great variety. In baling your hay, use our Steel Baling Ties. Cheaper than Wire—Better than Rope.

TRUMAN, ISHAM & HOOKER,
421—427 Market Street, San Francisco.

The BUYERS' GUIDE is issued Sept. and March, each year. 48-312 pages, 8 1/2 x 11 1/2 inches, with over 3,500 illustrations—a whole Picture Gallery. GIVES Wholesale Prices

direct to consumers on all goods for personal or family use. Tells how to order, and gives exact cost of everything you use, eat, drink, wear, or have fun with. These INVALUABLE BOOKS contain information gleaned from the markets of the world. We will mail a copy FREE to any address upon receipt of 10 cts. to defray expense of mailing. Let us hear from you. Respectfully,

HAY PRESSES.

We, the PRICE HAY PRESS COMPANY, manufacture, at San Leandro, Cal., the following Baling Presses under the immediate supervision of

OUR SUPERINTENDENT, JACOB PRICE, who is the sole Inventor and Patentee thereof, and who has been continuously engaged in the manufacture of Baling Presses for 25 years.

For Hay.

The Hurricane (see cut above), size A. \$1000
The Hurricane (see cut above), size B. 1000
The Monarch, greatly improved. 600
The Junior Monarch, improved. 500
The Genuine Price Petaluma. 350
The Climax. 300
The Improved Eagle. 250

For Wool.

The Monarch. From \$500 to \$2000

For Hides.

The Eclipse. \$500

The above Hay Presses range in capacity from 10 to 40 tons per day, and some of them make (according to size) either the common or the compressed bale. There is nothing in the United States approaching our Hurricane and Junior Monarch for speed or excellence of work. Send for large illustrated Catalogue to

A Landmark at Monterey.

California, though young, has a history full of moment and interest. As one of the pioneers recalls from memory the incidents of the last 40 years, or as a younger citizen reads in the many books which have been written the occurrences of the same period, it is almost incredible that so much could be accomplished in so short a time. This fact increases the interest in what may be called our historic materials. It is fortunately so, for the result will be the cherishing of the vestiges of early civilization and progress which in a more careless state of the public mind might become forgotten and obliterated.

We give on this page an engraving of a building which figured largely in the events attending the birth of California as an American State—the old Custom-house at Monterey. All remember, of course, that it was at Monterey that California was formally taken possession of by the U. S. forces under Commodore Sloat, in July, 1846. The flag was raised on that occasion over the building shown in the engraving, and upon the same flagstaff, which is there seen. Last year was the fortieth anniversary of the event, and was appropriately celebrated by the

Veterans of the Mexican war, Major E. A. Sherman of Oakland being the originator of the movement and a leader in the celebration, which was very successfully carried out. Major Sherman continued his disinterested public service by writing an account of the celebration, which is published in neat form by the Fraternal Publishing Company of this city. The book has several good illustrations, and one of them is reproduced upon this page. It shows the old Custom-house as seen from the street; behind it lies the waters of Monterey bay.

From these waters at 9 o'clock on the morning of July 7, 1846, the expedition from Commodore Sloat's flagship, the Savannah, composed of boats of the Savannah, Levant and Cyane, landed without opposition at the mole. The forces were then marched up a short distance to the Custom-house. Here the marines and men were halted and the proclamation read to the multitude by Rodman M. Price, Esq., purser of the Cyane, in a loud and distinct manner, followed by three hearty cheers by those present. The flag of the United States was then hoisted by Acting-Lieutenant Edward Higgins, immediately after which a salute of 21 guns

was fired by the Savannah and Cyane. The Custom-house was then turned into barracks for the United States forces and everything settled down quietly.

As the engraving shows, the building is really in three parts. It is what might be called a piece of National crazy-quilt work, as two portions of it were erected under the Spanish and Mexican flags and afterward patched together by the Americans. This historic building has been in charge of Captain Thomas G. Lambert and wife for 20 years, and they deserve great credit for the handsome manner in which they

BEET SUGAR.—There are still signs of growth in the beet sugar business. Specimens of beets grown in Fresno county have been received from time to time by Professor Hilgard at the University, and analyses have been made upon which he will no doubt prepare a statement for the public. It is announced that an enterprise of considerable dimensions is in contemplation for the Pajaro valley. It has been rumored for some time that capital which has long had for its objective point the production of cane sugar in the Sandwich islands, would be ere long turned toward the extension of the

The Live-Stock Interest in Japan.

There has been a considerable movement of breeding stock from this State to Japan of late. The grade of stock selected by the Japanese agents has not been of the best, it is true. The common stock of this country is so vastly superior to their dwarfed cattle that it may seem quite good enough, but the Japanese will, no doubt, get their ideas advanced to the plane of improvement beyond the standards which they now seem to hold. The reason why the Japanese seem disposed to increase their live-stock

interest seems to rest upon a great advance in the carnivorous taste of the people. It is announced that the demand for beef has so greatly increased of late that it is feared that if the demand continues to increase the stock of cattle will be exhausted. Mr. Kamiza Shin-kichi of Shigagori, in Nagano Prefecture, who has devoted himself to cattle-breeding for some years past, intends to rear cattle on a large scale. He has recently arrived in the Japanese capital and bought scores of animals of foreign origin or half-bred. As the price of cattle is very high in Japan, he intends to send orders to the United States for a further supply of cattle. It is quite likely that

A HISTORIC LANDMARK—THE OLD CUSTOM-HOUSE AT MONTEREY.

cleaned and adorned it for the celebration last year. Upon that occasion the building was wrapped in bunting, and in front of the balcony were designs worked in flowers, flags and war emblems; the coats-of-arms of the United States, Spain, and Mexico, and the dates 1776, 1846, and 1886.

We trust the attention which has been called to this historic building will result in its preservation from ruin or decay. The interest with which it will be regarded at the end of its first century may be imagined, and the thanks of future generations will be to all who now minister to its preservation.

DEATH OF A PROMINENT BEE-KEEPER.—We regret exceedingly to hear of the death of J. D. Enas of Napa, well known as a bee-keeper and as a writer on this and kindred subjects in our columns. He was accounted an active and enterprising citizen of Napa county, and his removal will be sincerely mourned. His death followed a long and painful illness. He was a native of Massachusetts, and but 53 years of age at his death. His bereaved wife and children will have the sympathy of all our readers.

beet sugar interest in this State. This will be very fortunate. The business needs capital, and if it will come in and pay a fair price for the vast amount of beets which can be grown in this State, the capital will be entitled to its reward. We trust that such rumors will soon take visible form.

GARDEN PROFITS IN CAROLINA.—Half an acre of average soil planted to onions in Anderson county, S. C., yielded a clear profit of \$69 over the cost of seed and fertilizers, which is at the rate of about \$140 per acre. The same half-acre will be planted in cabbages, so as to yield two crops the same year. The Charleston News, which makes the above statement, deems this better than cotton-growing, and believes that with high cultivation greater profits could be realized.

DEATH OF A WELL KNOWN BREEDER.—F. J. Barretto, a native of New York, and a well-known stock-raiser, and formerly president of the Los Angeles County Agricultural Association, died last week. Mr. Barretto was one of the leading Jersey breeders of Southern California. We hear with deep regret of his demise.

the awakening of the live-stock interest across the Pacific may ere long be a great advantage to our Pacific Coast breeders.

THE LABOR PROBLEM.—It is exceedingly gratifying to know that there has really been great progress made during the last two years in the employment of white labor in our fruit industry. We never had a bit of sympathy with those who cried aloud for reform but offered no acceptable substitute for the objectionable labor the fruit-grower was obliged to employ, but we really rejoice that gradually there are more people being found willing to take earnest hold of the pleasant labor which the handling of our fruit crop affords. There is now a large army of women and girls being employed in our canneries and drying establishments, both in city and country, and many growers are finding this help better than the Chinese. They have tried many unsatisfactory experiments toward that end. Of late the movement seems to be succeeding better, and as the work is destined to increase almost immeasurably, it will be well for the State to have the satisfactory character of women's help demonstrated.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Two Orchards in Tuolumne.

EDITORS PRESS:—Where the rock-crowned Table mountain of southern Tuolumne breaks into ragged spurs, jutting out from the one main armored giant, a serene little valley lies encircled by the wall-like hills that shut out the chilling winds and the blighting frosts; and in this little valley, this one choice, sunny spot, is planted the

Mountain Pass Orchard.

One of the famous old peach gardens of Tuolumne. Mr. Goodwin, the proprietor, whose experience and constant care have won for himself rich rewards in magnificent specimens of almost perfect fruit, has been a resident for many years, having planted some of the fruit trees as early as 1856. Thus he has seen grow up around him tender saplings that absorbed the rich fair sunshine of the many vanished springtimes, which now have changed to trees tall and gaugled and ancient, bearing a plentiful harvest—boxes and baskets of ripe, fair-cheeked peaches—in place of the few he so triumphantly gathered as his first crop long ago.

Among his famous old trees set out in 1856 are three which have the reputation of being the largest fig trees in the State. They are planted near together, so that their branches, interweaving, form a roof that droops to the ground, shutting out the blue skies and the fair outside world with a marvelous tent made of broad and dusky green leaves, while three white pillars rise from the ground to the high dome and send out numberless supports like an umbrella slantwise, reaching the top and sides with their slender white branches. The largest tree measures over 11 feet in circumference, and from them Mr. Goodwin receives an incredible harvest of figs.

This orchard in these later years has spread far out in the little valley, and contains hundreds of trees, all flourishing, and valuable fruit-producers; among them oranges that bear sweet golden harvests, astonishingly abundant for this high mountainous country, and 25 walnut trees that have attained to a good size and produce fine crops. The fruit is disposed of by peddling in the county from place to place. Some of it is dried, and still some shipped to San Francisco. There is always a ready market and no waste, so anxious are all purchasers for fruit from this orchard, which is a warranty for its superiority.

A vineyard not so large as the orchard receives a great deal of attention, and is worthy of notice. The grapes produced are choice varieties for table use, and the more common sorts utilized mostly for making wine. About 3000 gallons are made every year and the wine receives high praise. Mr. Goodwin having orders for it even from Sonoma, the celebrated grape county.

A comfortable, home-like residence stands in the midst of this beautiful orchard, and under the cool, swaying shadows of its aged trees. Roses bloom brilliantly and luxuriantly all about it, and border the drive that leads from the road to the house, while climbing honey-suckles weave their white and yellow blossoms into fragrant, dew-wet masses over trees and bushes and arbors alike.

And so in this glorious, fruitful garden, one of the oldest and finest of which our State can boast, the owner has passed many long, quiet years of a busy, useful life, and has seen the light of its prosperity rise like the sun each morning from the rock hills in the east, and shine from the zenith full and bright into the very heart of this charming little valley far up among the hills.

The Oak Springs Orchard.

About four miles from Chinese Camp, under the sheltering wall of Table mountain and spreading out over the low sunlit slopes of a quiet little valley, grows the Oak Springs orchard, one well known even in past years, but still flourishing and growing larger and larger with the addition of younger bright-leaved trees. Even the famed old-time orchards known so well to early day Tuolumneites in these latter progressive years have overspread by many acres their ancient limits, so that now there seems to be more of the new young trees than of the gaugled sturdy grove of bygone times.

Mr. Quinn, the proprietor, has been here for about 11 years patiently planting and cultivating for still greater perfection in his fruit, until now he has obtained results of which he may well feel proud, so enthusiastic are all in the praises of his fruit. Indeed, favored by the high altitude, mountain air and protecting hills, he has great encouragement to cultivate highly his thriving trees, for certainly in the end his reward could not be greater.

Peaches and apricots are most abundant, indeed this particular locality seems peculiarly adapted to the support of these varieties, and they thrive wonderfully, attaining a large size and bearing most delicious fruit in the course of only a few years. There is always a ready market for this fruit, and the portion not easily disposed of in the county commands the highest price in San Francisco.

An experiment with persimmon trees resulting favorably, Mr. Quinn has set out several additional ones. Oranges also do well, being

protected from severe frosts by the kindly sheltering hills that also shut out rough and blighting winds.

Grapes are cultivated, and on the sunshine-kissed hillsides, with water abundant and rich soil, they bear clusters almost perfect in fullness and fine flavor. All of the choice varieties are of course made into raisins or shipped, and besides these the Mission grapes and other more common kinds are used for wine. About 1000 gallons each year is the product.

So as time glides on, uprooting and trampling upon the proud landmarks of other days, showing how fleeting is all terrestrial strength and greatness by the wrecks that are found crumbling on every hand, it only serves to brighten the waxy leaves in the fair old orchards, green and glistening from a thousand dew visits and sun kisses, showing the barren hills now blossoming in springtime's tender light with the bright blooms of peach and apple and snow-covered clusters of almonds; and as each year advances, adding strength and beauty and a higher flavor to the plenitude of their yellow harvests, and blessing man with one of the choicest of nature's blessings—the bending gold-crowned tree of ripened fruit.

MAY BLOSSOM DAVIS.

Sierra Valley Artesian Wells.

EDITORS PRESS:—Haying is going rapidly forward. The crop promises to be fair. The prospect for a grain crop is not so favorable, owing to the cold weather in the spring. We are having cold nights, as is frequently the case in haying in this high mountain valley. A few mornings ago ice was to be seen as thick as window-glass.

The business of boring artesian wells is being pushed rapidly forward. The vexed question with the Sierra valley ranchman has been how to procure a proper water supply, for even on the ranches which have had fine streams of water in their meadows, there has been much pasture land, where there seemed no possible means of supplying water. Therefore we look upon these artesian wells as a great blessing to us. The first well-borer, bought by a company of 16 persons, began work here something over two years ago; since then there have been five other machines brought into the valley. There have this season been four well borers at work. The first one brought to the valley has done the most work; next after this a large machine with six-inch borer, owned by E. E. Haley of Honey Lake Valley. This machine was purchased at a cost of \$2800. Mr. Haley is well equipped for work, taking with him from ranch to ranch a crew of four men; also 10 horses, a large four-horse water-wagon, etc. The machine is warranted to bore 1000 feet deep, though it has gone deeper on several occasions, one of the finest wells in the valley being 1040 feet deep. Mr. Haley's machine is now boring for R. Martin, merchant at the summit, between Sierra and Long valleys. This machine has just left the ranch of Wm. Arms, five miles east of Beckworth, where three wells were bored, the largest yielding probably 140 or 150 gallons a minute, being only 325 feet deep.

The machine is supplied with tools for drilling rock. STAR.

Sierra Valley.

FORESTRY.

Transactions of the State Board.

The State Board of Forestry was in session during last week. Conferences were held with different parties interested in forest preservation, and ways and means to effect it were discussed.

Public and Official Aid Solicited.

Thursday morning was occupied in preparing the following circulars, copies of which will be posted to persons concerned throughout the State:

To State Boards of Trade: The State Board of Forestry invite your co-operation in their efforts to preserve the timber on forest lands of this State from the waste now prevailing. The depredations of timber thieves, the ravages of fire, started sometimes inadvertently by campers and sheep-herders and often designedly by the latter for the purpose of creating new pasture-lands or for other reasons, the browsing of the sheep upon the tender shoots of the young trees, are among the principal evils which are causing a wasteful depletion of the timber resources of the State and operating to prevent their renewal by the efforts of nature.

It will be the effort of this Board to put a stop to all unlawful actions operating to the detriment of the State in regard to its timber-lands. The many evils that will surely flow from the denudation of our mountains have been repeatedly pointed out. The results upon our irrigating, farming and navigating interests can easily be predicted from past experience in other countries; they can but be deplorable.

This Board is advised that much public timberland is being taken up by entry or otherwise by dummies in the interests of speculators who propose to strip the land ruthlessly and then abandon it.

We ask your assistance to aid us in putting a stop to this practice and to use your influence in every way to check the waste we have alluded to from other causes.

This Board proposes to establish experimental stations in different parts of the State where, under their supervision, forest trees from other countries will be planted and tested as to their usefulness and adaptability to our soil and climate. It is thought by this Board that such stations may be made at-

tractive and instructive, and that their establishment in any locality will be a benefit to it. We have invited proposals for donations of land to the Board to be used for the purposes indicated, and invite your consideration of and support to the project in your locality.

Aid Solicited.

To the Lumbermen: The importance of the lumber industry is fully recognized by the State Board of Forestry. To those engaged in this industry the importance of maintaining a continuous supply of lumber by means of renewed growth must be equally evident. Under the present land laws the honest and legitimate lumber dealer is in continuous competition with the robber and perjurer, who are now so extensively despoiling the Government and State school lands. The land laws are such that strict compliance with them by lumbermen is almost impossible. Owing to the total absence of official supervision, destructive fires spread from one district to another, to the great injury of the lumber interest both present and prospective. We should be glad to have your views on this subject, and especially as to our plan.

This is, that all the forest lands in the State should now be withdrawn from sale or entry and the lumber industry provided for by the European system of sale of the timber alone, leaving the land title in the Government, with the responsibility of establishing a new growth as fast as timber is cut. Thus the mountain-sides, springs and streams will be protected, a perennial supply of timber and fuel be maintained and the necessity of violation of land in the lumber industry be done away with. Please give us your views.

To County Sheriffs.

To the Sheriff of — county: The loss of property in this State caused by fires is very great. In the forests destructive fires are now allowed to go unchecked, except occasionally, when private interests demand protection. From this cause, as well as owing to the present extensive illegal cutting of timber from Government and State school land, denudation and waste in our forests is great. Thus the property of the people and of the school-children is dissipated, the sources of the springs and streams are injured, floods alternate with droughts, and the whole irrigation and agricultural interests of the State suffer.

The State Board of Forestry desires to remedy these conditions. Among its measures is one to form a forestry police. The duties of these officers will be to report fires set in the forests with all possible evidence, so that we may proceed in law against such violators, and also to report all trespass and robbery upon the State school lands—Sections 16 and 36 in each township—and upon the Government lands, with names of witnesses, etc. Our funds will not permit us to pay for the whole time of competent men, but we should be glad to pay liberally for actual work done as indicated. Please send us the name of a reliable man who could act for us in these matters. We thought some deputy in your office at times, when his duties permitted, might undertake such work.

A Station Proposed.

In accordance with the last resolution, Mr. A. T. Hatch, the well-known fruit-grower of Solano county, who is also largely interested in Alameda county, appeared before the board and expressed his belief in the proposed system of parks or forestry stations. He suggests the dividing of a certain beautiful tract of 1400 or 1600 acres in the Livermore valley into four quarters, and converting the central 20 acres of it into a public park of ornamental hardwood and forest trees, under the supervision of the Commission. Four roads may approach the groves, from each side.

Chairman Kinney, after the others present had coincided in the view, spoke generally of the plan. "These stations," he said, "will be in the nature of national parks, with the exception that they will be kept free from underbrush, and it will, therefore, be immediately perceived that their presence in any locality will enhance the value of the surrounding land. Once these stations are established, the Commission does not doubt its ability to secure enough funds from the Legislature to insure their perpetuity."

Laws to Save the Trees.

Thomas Magee of San Francisco prepared an interesting paper at the suggestion of the board upon the general subject of Forest Culture and the fearful inroads which are being made upon the fine natural growths of the State. To arrest this he proposes the enactment of proper laws. He said: "The first change needed is the passage of a law that shall utterly prohibit the pasturing of sheep on Government land. Neither Uncle Sam nor any county government of the State has ever been paid one dollar in rent, license or tax of any kind for the use of these mountain pastures by sheep-herders. They come in summer when the mountains are accessible, and leave in winter, when snow shuts them in. An attempt by one mountain county to levy a tax on these sheep-herding, grass-sod, and tree-destroying bandits was last month defeated by the Supreme Court. The remedy is in the hands of the General Government. If there were no other remedy, it would pay the Government and this State, either singly or unitedly, to pay the sheep-herders any profit they can pretend to say they make from their herds in summer, to keep them out of the mountains. Then, as to timber for domestic use, I think the taking up of timberlands in 160-acre tracts under pre-emption, should at once be prohibited. In eight cases in ten such pre-emption is done by a dummy, and by perjury, with no other object than to sell out to a timber speculator or a sawmill man. Timberlands should be sold in tracts of say 5000 acres to the highest bidder, after due advertising, one-half of the purchase money to be refunded to the buyer within ten years, on his reconveying to the Government the land sold with groves of at least two-year-old trees planted on it, the number

per acre to be specified. This law would allow the buyer to cut the old timber. The land would then be useless to him. To replant it would cost little, and when the new planting was accomplished and had attained a certain height, he could reed it to the Government and receive back half of the original purchase-price. Of course, I only suggest this plan, not knowing whether it is or not the best that might be devised for reconciling use with continued growth. Timber must be had for domestic and commercial uses, in house-building, the manufacture of furniture, for lumber export, and in many places for fuel. That fact cannot be, and is not, here overlooked. Lumber manufacturers excuse their present use of pre-emption dummies, and of bribery, perjury and of wholesale grabbing by scrip and warrants, by saying that 160 acres of timber is of no use to any one, and that to justify the erection of a sawmill and expensive machinery, at least 5000 acres must be acquired in one body. They say that they would vastly rather buy the land from the Government at a full price and thus have no cloud upon their title. They claim that timberland should not be open to pre-emption under the Homestead law, and say that even where dummies are not employed, small speculators appear when any desirable timber tract is approached by a railroad or settlement, who take up the land in 160-acre tracts for speculation merely and to sell out to men like themselves, who will build a mill and use the timber. If the Government were to sell the timberland in large tracts to the highest bidder, it would receive the full value of the land, while its repurchase, replanted within ten years, would keep the supply intact.

Engineer and Attorney Appointed.

A formal agreement was made between Mr. Davison and the members of the board that he shall be official civil engineer of the board from and after August 1st, at a salary of \$150 per month and traveling expenses. Mr. Davison received his instructions from the Commission, and will proceed at once to prepare accurate maps of the timber sections of the State, beginning with the northern counties.

At the session of the board on Saturday the most important business transacted was the appointment of Edward L. Collins, an attorney of the city, as special agent of the board to arrange evidence for the prosecution of the parties who are known to have been removing valuable timber from sections of school lands during the past 10 years. It is known that over \$90,000 worth of timber has been stolen, and from the evidence already secured it is believed that with proper efforts convictions may be secured.

Redwood Park in San Mateo.

R. S. Smith of the Redwood City Gazette appeared before the board in regard to a project of his to have set apart as a public preserve about 20,000 acres of redwood-timber lands in the southern part of San Mateo county, below Pescadero. It is desired that the Legislature be urged to consent to the setting apart and condemnation of the land by the Government for use as a public park. Here on the Coast Range ridges and canyons is a forest primeval of the sequoia. If the Government will set the district apart the Commissioners will make an experimental station there and assume charge and care of the trees. At the next meeting of the Commissioners, in about a month, the tract will be inspected. It belongs to several private owners and may be purchased for about \$300,000.

R. F. Fernow, Chief of the Forestry Division of the Agricultural Department, has written a strong indorsement of the project for reserving a portion of the coast for a redwood forest, between Pescadero and Santa Cruz. But, strange to say, for quite different reasons than those advanced by the author of the plan. Mr. Fernow says the reserve would pay the Government dollars and cents. The plan is to be placed before the Pacific Coast delegation to secure national aid.

Senator Hearst's Views.

United States Senator Hearst appeared by invitation before the board, and gave his views regarding the evils attending forest depredations. He believed it to be of more importance to protect the forests already standing than to guard the young growth. He believed the greatest damage done to young timber was that caused by sheep and goats, which by far exceeded that done by campers and malicious people who had fired the forests. He had little faith in Government supervision of timberland, and would favor a survey of all Government timberland above the 2800-foot level and the deeding of the same to the State. He said he had been over nearly every foot of the Sierra, and had moaned over the ruthless waste of timber for the past 25 years, and the evil still continued. He thought the survey proposed by him should be made on each side of the mountain range, and the State take charge of the timber. It was of little value to the Government at present, and a bill looking to that result might have a show of passage. He believed that if the forests were protected against fire and other destructive causes they would reproduce themselves. In the neighborhood of Grass Valley and Nevada City, where proper protective measures had been taken, he had seen new forests grow up from the seed in the last 20 years whose trees are now 60 to 80 feet high. The sawing of timber was one great cause for the frequency of forest fires. The trees were felled, and as they lay prone on the ground the great limbs were lopped off and

left to litter the ground. They died in time, and it needed but a spark to set a fire among this inflammable mass. He thought that a system should be instituted looking to clearing out of the underbrush and refuse on all timber tracts. He would advocate the selling off of a proportion of the trees on public land, proper care of trees left standing, and the protection and encouragement of the younger growth. It was a matter of time to grow timber, but he had seen in his day trees grow up from mere shoots that were now fit for house timbers. He would favor stations where officers should be located detailed to watch the forests and guard them against fire and spoliation.

Other Matters

Brought out by the session of the board we reserve for future allusion.

POULTRY YARD.

Practical Poultry Points.

EDITORS PRESS:—Although there are many improvements and simplifications of poultry management which are desirable, I cannot wholly agree with the writer of your article published July 2d, from the *Culitologist*, on "Automatic Poultry Feeding," for two reasons.

First, poultry need close watching every day, and when you feed you are apt to discover anything needing attention.

Second, poultry or any other animal (including man) flourish better to eat their food up clean and then wait for awhile "between meals."

But a great many advantages are gained in raising poultry by arranging to

Water and Feed Them

Without entering the yard, especially when muddy or the care devolves on a female member of the family.

This is best accomplished by making the pickets at the most convenient side of the yard small and smooth and about two and a half inches apart, so poultry can easily reach through.

For watering, set against the pickets on the outside a water-dish made of an oil-can cut in two lengthwise about three inches deep.

For food, milk, etc., make a V-shaped trough of two pieces board, one six and one eight inches wide, and long enough to accommodate the number of poultry; set the narrower side of trough against the outside of the fence.

To keep out rain and dust and prevent outside interference, get a board about 12 inches wide and long enough to cover the water and feed troughs and attach it to the fence above the trough with leather or other hinges so it will hang slanting over and cover them. Set a self-acting wooden or other latch on to hold the cover up while feeding, etc.

This simple arrangement saves going into the yard in muddy weather, keeps the stronger poultry from driving the weaker away, and prevents waste of food. Of course whole grain if fed in the trough should have straw scattered over it to prevent too fast eating.

Rats.

If rats bother you, make a board cover for night to fit the feed trough rat-tight, although poultry should never be fed more than they will eat clean, thereby leaving a bait for the rats.

Latches.

Speaking of a latch to hold up the trough cover reminds us that we have seen a person stop five times per day for 40 years (how many is that?) to put a stick or stone against a door or gate to keep it open, when 15 minutes' work would make a wooden self-acting latch to do it for him; viz., take a short piece of board, bore a hole in one end and saw and notch the other so it will catch on to the top of gate, shaped as shown in the engraving.

Attach this to the fence or side of building with a screw or even nail and the latch is complete.

While you are about it, make a number and put one on for every door and gate on the farm. These latches are equally as good if attached to a gate or door to hold it shut. CHICO.

The Old Breeds.

E. C. Clapp of Pasadena, an occasional contributor to the *RURAL*, has the following in the *Cackler* on the old favorites:

I admire the pluck of some of the old breeders and the poultry journals of this country in what they are doing in the way of perfecting new breeds of fowls. Were it not for some of this kind of work—yes, much of it—we would still be at work with the old dung-hill fowl, and would know little of the Leghorn egg basket, the Brahma potful of meat, or the great and happy medium, Plymouth rocks—the birds that flavor of both meat and eggs.

Now, I don't wish to dampen any one's ambition in the least, or put even a small straw in the way of any person, but I would like to ask just here, Why not let the older breeders do the work of bringing out the new breeds to perfection, even if they do gain the glory? How many, as they first go into the poultry busi-

ness, full of fire and bound to win, make fame and fortune, etc., are able to judge of the make-up of any one of the older breeds, how to mate for best results, how to feed and manage them, the care and detail peculiar to the breed? If, perchance, they do understand one breed fairly well, how about two or more of them?

But to the point: I find that it wants and requires some experience and good fowls, even with the older breeds, to be reasonably sure of producing 90-point birds, or better. Knowing this, I would say to those just entering the business, stay by the old standard breeds; don't throw away time, patience and money by starting with the latest arrivals for honors in the poultry yard. There is enough glory for young or old fanciers in staying with the old reliables and breeding them at their very best; there is still a big call for them, and long will be.

Lest some one may think I have soured on some of the new kinds, I will say, frankly, I have not, nor do I want to; some of them are yet to stand well to the front among the breeds for general good qualities—for instance, White Plymouth Rocks, White Wyandottes, also the Wyandottes—but they have some points to improve yet before they will do well for general use by young fanciers. So, I would say, learn the business with that which has been tried for a long time, and liked.

THE FIELD.

California Productions.

At the annual meeting of the Produce Exchange in this city on Wednesday of last week, Wm. Dresbach, president, delivered an address from which we take the following:

During the past year the Exchange has issued two reports on the wheat and barley crops, one on the 1st of April and one on the 1st of June. These reports have been collated from the answers of over 150 correspondents, covering every section of the State where the cereals named are grown. On behalf of the Exchange I wish to thank the various correspondents for their courtesy in giving the information asked for, which, it must be understood, is entirely voluntary. The reports purport to give the actual condition of the crops on the date named. They do not say what the actual yield will be, as that is something that cannot be determined until after the harvest is completed, and even then correct estimates are difficult to make.

The value of these crop reports cannot be overestimated, especially considering the incomplete reports published concerning the crops in this State by the United States Agricultural Bureau. The United States Agent gives information no more valuable. The position this State and this coast hold as grain-producers certainly entitles them to more consideration than they now receive at the hands of the Bureau at Washington. I am of the opinion that a decided improvement could be made in these crop reports if the gathering of the information were confined to this Exchange, and its secretary should be appointed United States State Agent.

From statistics of the crop of 1886, which are now complete, it would seem that the State raised 1,070,000 tons of wheat. At harvest-time a much larger yield was confidently expected, but as time wore on former estimates had to be reduced, until it became a certainty that the yield of 1886 was below rather than above an average. This is the more remarkable considering the generous rainfall, amounting to some 32 inches. With regard to the present harvest, from the reports collated by this Exchange, it would appear that the output will be less than it was last year.

While it has always been the policy of your Exchange and of your Board of Directors to refrain from recommending any legislation, occasions have arisen when the interests of the grain trade and of the producers have forced them to deviate from this rule. Last winter, with the co-operation of the Chamber of Commerce, with a view of bringing about a more economical administration of our seawall and water-front—one more calculated to benefit the grain trade of this city—bills were prepared and presented to the Legislature, then in session in Sacramento, without, I regret to say, receiving the approval of either body.

The protection of the farming interests receives from foreign Governments their closest attention, as witness the heavy import duties levied on breadstuffs by France, Germany and Spain and some of the other European countries. The principal exception is the United Kingdom, and even there, such taxation is being industriously agitated.

The following table, taken from the *New York Exchange Weekly*, gives the custom duties imposed by the principal importing European nations upon American cereals:

Countries.	Flour per bbl.	Wheat per bu.	Corn per bu.	Barley per bu.
France	\$1 37	\$26	free	\$6
Germany	\$1 58	19	06	08
Spain	\$1 50	30	16	13
Portugal	\$1 53	30	25	19
Italy	94	16	16	free
United Kingdom	free	free	free	free
Belgium	free	free	free	free
Holland	free	free	free	free

All this is directly to the disadvantage of the American farmer; and to California, exporting

more wheat than any one State, it is a matter of vital importance. The question is, What can be done to counteract the burden that is thus indirectly imposed upon our farmers? Germany built up her sugar trade, now grown to great proportions, by an export bonus, and it may become necessary for the United States to adopt some similar measure, and by some means afford our farmers the protection that is their due.

Gentlemen, a great deal has been said and written about the capabilities of this State and its resources, but I doubt if any of us but dimly appreciate as yet the glorious future that awaits this, the Golden State of our Republic. Time was when naught was thought of but the precious metal, gold. This era passed, and there succeeded another golden era—that of wheat, when the tillers of the soil thought of no other crop and when wheat became king. Wheat is king to-day and will remain so for many a day to come, but no longer is it the sole thought and reliance of the husbandman, although as a natural grain-growing State California is unsurpassed. There are lands producing to-day as good and as large crops as they did 30 years ago, although they have been sown and crops gathered off them every year during that period. But now we are beginning to hear in no uncertain terms of the other products that our soil and climate enable us to raise so profusely, and, mind you, so economically as well.

When your Exchange was founded, the only articles dealt in were flour, wheat and barley. Now look at the tables during any of your morning sessions and see the articles without number that none of you ever expected would appear on the floor of this Exchange. Among others I will but mention hops and beans, and your secretary has prepared tables to show the receipts and exports in these articles during the past 12 months. California to-day raises more beans than any other State in the Union, and, as its capabilities for producing this crop are unrivaled, the production can be vastly increased. San Luis Obispo, Ventura and Santa Barbara counties alone can raise sufficient beans to supply the population of the United States, and at no distant day will you see the markets of this whole country looking to us for their supply of this necessary article of food.

And here let me remind you how other products of the soil, not so intimately connected with your Exchange, are forcing themselves into prominence. Whereas, formerly, on rare occasions, they might have been heard of, to-day, California fruits, wines, raisins and nuts are dealt in throughout the length and breadth of the United States. California is but awakening from a long period of inertia. You all know how the southern counties are experiencing a rapid growth that is being pushed forward with vigor and enterprise. The northern part of the State extends to the southern its warmest congratulations, knowing full well that, at no distant date, the resources of its fertile valleys and hills will be appreciated, and that then it will have its share of the tide of progress and immigration that is now doing so much for our southern neighbors. North or south it is but one State, and such it will remain. The Golden State—California—always has been and such it will ever be. It is the Empire State of the Pacific Slope, and this city, San Francisco, is its Queen City.

THE DAIRY.

Counterfeit Butter.

We are indebted, says the *Indiana Farmer*, to Dr. Wiley, chemist of the Department of Agriculture, for a copy of Bulletin No 13, devoted to the investigation of imitations of butter.

The subject is quite exhaustively discussed in its several bearings, historical, chemical and sanitary. The invention of artificial butter dates back no farther than 1870. Mege-Mouriés, a French chemist who was employed on the Imperial farm at Vincennes, published in 1870 the result of a series of experiments, in which he sought to imitate the physiological process of converting animal fat into butter, and two years later the siege of Paris gave him an opportunity of bringing his artificial butter into general use. From that time "oleomargarine" became a popular substitute for butter among the French peasantry.

The Bulletin gives the full text of the Act of Congress regulating the manufacture and sale of oleomargarine and other imitations of butter. This is followed by a list of 50 patents that have been issued from the U. S. Patent Office, embracing the materials and chemical methods, and the mechanical contrivances employed in the manufacture of oleomargarine, butterine, suine, etc. The original patent of Hyppolyte Mege is given at full length, with nine specifications. The American patents modify and simplify the French process in many respects.

The method of manufacture used by the firm of Armour & Co., Chicago, is as follows: The kidney tallow is taken from beef cattle in the process of slaughtering, and after thorough washing, it is placed in a bath of clean, cold water, surrounded by ice till the animal heat is removed. It is then cut very fine by machinery, and subjected to a temperature of 150° F., till the liquid fat has separated from the fibrine. When cold, this is subjected to a pressure which separates it from the more solid

stearine. This product is known commercially as "oleo," which, when churned with new milk, or cream, with usually a small portion of creamery butter—the whole being properly salted—gives the new food product, oleomargarine. In the manufacture of butterine, fresh leaf-lard is subjected to the same process as the kidney tallow in oleomargarine, and the product, when subjected to the action of strong brine for 48 hours, is known as "neutral." This is mixed in any desired proportion, with oleo and fine butter, and churned with milk or cream; it is then salted, packed, and ready for the market.

This can hardly be called an adulteration of butter. It is rather a substitute for that indispensable article of dairy food. The Act of Congress on the subject bids fair to increase, rather than diminish, the consumption of oleomargarine, as it makes its manufacture a legal business, and the product, when properly branded and stamped, a legitimate article of commerce.

In the investigation before the committee of Congress, a number of leading men of science—chemists, physiologists and sanitary experts—testified to the healthfulness of the product when made according to the submitted formula. Of this there will probably be no dispute; but will it always be so made? It is claimed that it would be nearly impossible to use old or rancid fats in the manufacture of oleomargarine on account of the difficulty, if not impossibility, of deodorizing them, and at the present time fresh kidney tallow is almost a waste product, kerosene having displaced candles.

Under the Act of Congress there are 37 factories engaged in the manufacture of artificial butter, distributed as follows: Colorado, 1; Illinois, 1; Indiana, 1; Kansas, 2; Massachusetts, 1; New York, 6; Ohio, 4; Pennsylvania, 5; Rhode Island, 2. In the months of November, December and January last, these factories made and delivered for sale to 259 wholesale dealers an aggregate of 10,029,961 pounds of oleomargarine. Of this amount, 114,697 pounds were exported, leaving 9,915,265 pounds for home consumption.

Feeding Value of Skim Milk.

Since the use of the Centrifugal cream separator is so extended in this State, the feeding value of skim milk is a matter of much interest. We find the following in the *Farm, Field and Fireside* of London, England:

At the recent Dairy Conference in Ireland, the above was one of the subjects treated of, the remarks made being as follows: In estimating its value as a food for animals it will be well to compare it with hay, which is much better appreciated than almost any other kind of cattle food. A fair analysis of the constituents of hay is—

	Per cent.
Albuminoids (flesh formers).....	9.0
Fat.....	2.5
Carbo-hydrates (heat formers).....	40.0

Total.....51.5

Upon this basis, 1 ton of hay and 1 ton of skim milk respectively contain:

	Hay, lb.	Skim Milk, lb.
Albuminoids.....	202	94
Fat.....	56	11
Carbo-hydrates.....	896	90

Totals.....1,154 195

The feeding constituents of hay, however, are not all digestible. Therefore, deducting the indigestible portion, we have 693 pounds remaining as applied to the albuminoids, fat, and carbo-hydrates, and divided respectively into quantities of 113 pounds, 26 pounds, and 554 pounds. Now, basing our calculations upon the value of the albuminoids and fat at 2d., the carbo-hydrates at 1d. per digestible unit, we get the following result:

	Hay, £. s. d.	Skim Milk, £. s. d.
Albuminoids.....	0 18 10	0 15 8
Fat.....	0 4 4	0 1 10
Carbo-hydrates.....	2 6 2	0 7 6

Totals.....£3 9 4 £1 5 0

Hay is worth this amount per ton when it is composed of good grasses which have been well saved, whereas no one can dispute the value of the milk, which is arrived at by the same process of reasoning, with this exception, that the whole of the solid constituents of the milk are estimated as digestible, whereas the fiber of the hay and the manurial value of both foods is omitted. Upon this basis skim milk is worth 1.36d. per gallon.

Lastly, skim milk can scarcely be overestimated as a food for pigs, although it does not return so large a profit in this direction. To utilize it to the best advantage it should be mixed with meals rich in carbon, such as barley-meal and maize, and in conjunction with these foods it produces the richest pork in the world. Experiments both at Rothamsted and in America have shown that a bushel of 60 pounds of maize is capable of conversion into 12 pounds of pork. It is also equal to 70 gallons of skimmed milk. Consequently, as maize can be purchased at 20s. per quart, skimmed milk, as compared with it, is worth less than 1d. per gallon; but as, by the same rule, 6 gallons of milk are equal to the manufacture of one pound of pork worth 6d., there would be no extravagance in assigning it a value as a pig food of 1d. per gallon.

PATRONS OF HUSBANDRY

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

The Worthy Master Away from Home.

[NUMBER 3.]

[Written for the RURAL PRESS by MRS. W. JOHNSTON.]

The next day carriages were provided by the Honolulu Masonic Fraternity to carry us all to the beach, where surf-bathing could be indulged in. Captain Houdlett, commander of the good ship Australia which brought us safely over, accompanied the party, taking with him the band that had furnished such sweet music at each meal on shipboard; so we felt quite at home in the elegantly fitted up hall of Spreckels & Co. There we again heard the soft, sweet notes of the harp and other instruments that had grown so familiar to us on our voyage.

In the evening at our hotel, a grand banquet was given to the Masons, the King honoring them with his presence. At the same time the ladies were entertained on the veranda by the King's band, as they had been for two nights before.

The next day the gentlemen of the party were invited out to the King's grounds to see his dancers. Of this I cannot speak—perhaps it was something like Herod's customs. The ladies spent the day in calling, shopping and taking in the sights near at hand.

Saturday afternoon was the time of all times for us. I feel embarrassed at attempting to describe this wonderful royal entertainment. It was a native "Luau"—we would call it a picnic. It was given on the beach of one of the King's grounds, adjoining those we visited before. His Royal Highness' rancho—as he learned to call it from the Worthy Master—is simply a large grove of coconuts, with low shade-giving trees intermingled, nestling in which is a charming little cottage for the King's entertainments, and further on upon the beach is another. The ground is thickly matted over with native or Bermuda grass. The feast or "Luau" was expressly for the Masonic excursion party, no natives being present but the King and the royal family and servants.

One of the pleasant features of the day was the presence of the King's band, who were there evidently to be heard as well as seen. Sandwiched between their many charming pieces of native music were medleys of American National airs such as "Star-Spangled Banner," "Red, White and Blue," "Marching Through Georgia," etc., which carried the guests—soul and spirit, not bodily—back to their native land for a few minutes.

But our spiritual visit, let me tell you, was of short duration, for, as we wandered through the grounds or sat in our comfortable seats, we were completely lost in wonder and admiration at all that was going on around us. A short distance from where our chairs were placed the royal family sat carelessly in a circle, while on the opposite side was the band. The King's dancers were with the family, and perhaps part of it. None were presented save Grand W. M. Atkinson and family. They were honored with an introduction to the Princess, the Queen's sister, the highest in honor in this circle, as the Queen was absent. The introduction was performed by the King himself, who seated them in this circle and decorated Mrs. Atkinson—our queen for the time being—with a native sash of green vines, making her look charming. The natives all wear something of this kind, either a sash, wreath or necklace; the first are made of green, while the last two are of feathers or flowers.

The King wore a long double necklace of bright yellow feathers and a small Derby hat with a broad black ribbon, on top of which was a wreath of little white flowers. His coat was a short blouse, while his pants were of a heavy white material, something like eider-down. His shoes and gloves were of white kid. The native ladies, without an exception, wore "Mother Hubbards," some made of white wash goods and some of elegant silk. One I saw was of black alpaca with a train.

After spending an hour or two here, the King invited us to the beach to witness the performance of the surf-bathers, who were skilled in their part of the entertainment. The band accompanied us here also. The bathers were provided with planks about 10 feet long, 12 inches wide, and 4 inches thick in the middle, but smoothed, and dressed down to about 1 inch at the edge. These boards they float before them as they wade or swim far out to sea beyond the breakers. When a certain point is reached, the race for the shore begins, and it is very amusing. They lie flat upon the plank with one arm spinning round, half the time in the water and half the time out, like the crank of a windlass.

Part of the company were entertained in the cottage by the King's dancers, but I preferred to remain quietly in the shade of walking in the hot sun to see them. Soon all the party returned to the grove, where the band had preceded us and were doing their best to render the day perfect, while we waited for the tables to be prepared.

(To be Continued.)

SACRAMENTO COUNTY POMONA GRANGE meets at Sacramento, in Granger hall, Saturday, July 30th.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

Legalized robberies, amounting to millions of dollars, that must be paid by the masses of the people, are becoming more frequent with every passing year. The great wheat and coffee "corners" were of this class. The price of coffee was doubled to the millions of consumers in this country for several weeks; and who has estimated the millions of dollars, "stand and deliver," thus taken from them? How few people who are thus robbed are taking any action to have it stopped. The National Grange, at its late session in Philadelphia, had this subject under consideration, and with the view of bringing it before the Subordinate Granges and the people, passed the following resolutions:

Resolved, That the National Grange, Patrons of Husbandry, do hereby denounce and condemn the practice of the monopolists and speculators in the purchase of what is known in commercial circles as "futures," whether of cotton, corn, wheat, pork, or any other product of the farm; that we, the said Grange, believe it to be a species of iniquitous gambling; that it establishes the price of the produce of the farmer without regard to the necessity of the just and equitable law of supply and demand.

Resolved, That we recommend to the Subordinate Granges, and farmers generally, to petition their respective Legislatures to enact such laws as will make the said dealing in "futures" a misdemeanor, and punished as other crimes.

When public sentiment in regard to this subject is aroused as it should be, laws will be enacted prohibiting the dealing in "futures," and the natural law of supply and demand will govern the market in the necessary commodities of life.

ON this same subject the following is an extract from a decision by Judge Blandford of the Supreme Court of Georgia: "It is manifest that the consideration of the note sued on is for and on account of dealings commonly called 'futures.' Is such a transaction in the nature of gaming? The transaction termed 'futures' is this: One person says that I will sell you cotton at a certain time in the future for a certain price; you agree to pay that price, knowing that the person you deal with has no cotton to deliver at that time, but with the understanding that when the time arrives for delivery you are to pay him the difference between the market value of that cotton and the price you agreed to pay, if cotton declines, and if cotton advances he is to pay you the difference between what you promised to give and the advanced market price. If this is not a speculation on chances, a wagering and betting between the parties, then we are unable to understand the transaction. A betting on the game of faro, brag or poker cannot be more hazardous, dangerous or uncertain. Indeed, it may be said that these animals are tame, gentle and submissive compared to this monster. The law has caged them and driven them to their dens; they have been outlawed, while this ferocious beast has been allowed to stalk about in open midday, with gilded signs and flaming advertisements to lure the unhappy victim to its embrace of death and destruction. What are some of the consequences of these speculations on 'futures'? The faithful chroniclers of the day have informed us, as growing directly out of these nefarious practices, that there have been bankruptcies, defalcations of public officers, embezzlements, forgeries, larcenies and death."

PATENT LAWS.—W. A. Armstrong, Master of the N. Y. State Grange, in his last annual address, says: "The iniquities of our patent system are so great as to suggest imperative necessity for correction, whereby the wrongs it engenders shall be eliminated. The system encourages and promotes monopoly of the harsher character. This is illustrated in the combination which makes users of telephones pay for each instrument an annual rental ranging from 10 to 40 times the cost of the instrument itself. It is true that liberal allowance should be made for a service that requires skilled operators, and capital in establishing lines and keeping them in working order. Besides this, generous consideration should be had for the inventor, who is entitled to large reward for service rendered to the public. But with all these charges arranged on a scale that provides for magnificent returns, the public is required to pay four or five times as much as should be required in equity, most generously defined, to make suitable compensation for talent, capital and service. It will be seen, then, that the patent system establishes, or, at least, provides means for establishing monopolies that bear with great severity upon the public. * * * But this is not all. Opportunity is given for collusive suits at law, in which the courts are made the instruments of extortion by supporting fictitious claims. Illustrations of this evil are so numerous that they need hardly be cited. But if instances be required they may be found in the numerous demands made upon farmers for royalties on articles of common use—articles bought in good faith, in the very spirit of innocence, and with proffered guarantees by sellers and manufacturers against the very evil to which purchase and use open the way. It is estimated by competent authorities that exactions put upon farmers in this way amount annually to sums great enough to defray the entire expenses of the patent office, which is so conducted as to support iniquities that take the form of extortion. As matters stand, there is no security for the farmer who buys an implement that has improved adaptation to the use for which it is designed; for when he pays an extra sum for the improvement covered by a patent, he may be visited, later, by the owner of a prior patent, who has all the authority of law to demand payment of royalty, proportioned mainly by his greed. In this case Government has conferred its license and protection upon two persons with diverse claims, and each is empowered to collect of the purchaser or user of the patent device a sum at variance with the plainest principles of equity, and the only way of resistance is through courts, where interminable litigation tends to bills of cost far beyond the means of contestants. The system is so manifestly unjust, and so harsh in its operation, that correction should be sought at once through the earnest demand of those who suffer."

RESULTS OF THE GRANGE.—Elizabeth Boynton Harbert, in a late issue of the Chicago *Inter-Ocean*,

makes the following truthful remarks, and those living in rural districts where there are bright, living Granges have observed similar effects: "We hear from many sources great surprise expressed at the rapid growth of public sentiment in favor of an equality of rights, and particularly in regard to the fact that progress seems more rapid in our agricultural districts than in our larger towns and cities, and we are requested to suggest a reason. We think the answer may be embodied in two words: 'The Grange.' Silently and unobtrusively there is developing in our country an organization destined in the near future to effect results, startling in their character, to the careless observer. The fact that during the past 19 years the thoughtful men and women from our farm-homes have convened together on an exact equality to consult upon questions pertaining to the better methods of government in school and State, may not have attracted general attention, but influences may have been set in motion, incalculable in their results, and, as we believe, incalculable for good."

THE success of the Grange organization, now that the ritualistic work and the rules for the government of the Order are comparatively complete, depends upon the individual members of the Grange. The same unselfish devotion to principle, and love to God and man, which is necessary in building up the church, school and home, is equally essential in building up and perpetuating the Order of the Patrons of Husbandry. It is to the Grange, as a fitting adjunct to the church, that we must look for an organization that will help us in developing a higher and better manhood and womanhood among ourselves.—W. M. King, Secretary Potomac Grange.

IN these long days, while farmers are thinking of their harvests and bending their energies to preliminary tasks, politicians are weaving the webs that will ensnare the votes of the dear farmers, who forget that while they perform their daily labor well there are schemers whose successful plots lessen its rewards.—Husbandman.

EVERY toiler, every farmer, every member of the Grange, should take the oath of Hannibal before his father and his father's God, and "swear eternal enmity to all upholders of unjust and burdensome laws, which plunder you and your children of the little property slowly obtained by a lifetime of ceaseless toil through summer's heat and winter's cold."

PROGRESS.—Two more new Granges: one in Alabama and one in Pennsylvania.

"HAVE reorganized 17 Granges within a few weeks."—A. E. Page, Missouri.

THE Windham County, Vermont, Pomona Grange received 35 new members at its last meeting.

"Be patient, oh, be patient! the germs of mighty thought

Must have their silent undergrowth, must under ground be wrought;

But as sure as there's a Power that makes the years appear,

Our land shall be green with liberty, the blade time shall be here."

The Grange Gains Strength.

EDITORS PRESS:—After 12 months more have passed, it has been a great pleasure to meet again our very worthy secretary of the National Grange, Dr. John Trimble, at headquarters in Washington. Another year of work and anxiety, and of rather busier occupation, has brought no more wrinkles to Bro. Trimble's brow, and his good face bears that vigorous, cheerful cast which a successful year and health are wont to bring to all devoted workers in any cause.

I am sure many of your readers who are most interested in all that truly concerns the well-being of American farmers and American agriculture will be glad to know that an official and unvarnished report of the condition of the Order of the Patrons of Husbandry throughout the United States shows that the general condition of State and subordinate Granges is decidedly better than a year ago. It is a pleasure to inform you of the following official facts and figures, which our worthy secretary of the National Grange is willing to give me for your readers.

In the seven months since the last annual session of the National Grange, which was held in Philadelphia,

One Hundred and Thirty New Granges

Have been organized in the various States of the Union, as compared with only 91 during the same seven months of the last fiscal year. Indeed, I am very glad to learn from Bro. Trimble that this 130 is a larger number than were organized during the entire fiscal year ending last November. Bro. Trimble also informs me that more than three times that number of dormant Granges have been revived. This will make, you see, over 500 more subordinate Granges alive and working in the various States now than there were a year ago. This is certainly full of encouragement for the good cause. More than this, one more State Grange—that of Nebraska—has been reinstated by payment of back dues since the National Grange adjourned last December. There are now in all 34 State Granges in good standing, whose delegates will be entitled to attend the meeting of the National Grange at Lansing, Michigan, next November. This shows much greater strength and solidity than even the friends of the Grange have believed to exist.

The Finances

Of the National Grange, that backbone of every institution, are still in a very healthy condition, and its well-managed funds are ample to meet its current expenses, including the traveling and per diem of all State delegates to its annual sessions, which have always, under its organic law, been paid out of the treasury of the National Grange.

Such facts make it evident to both friends and

foes of the Order that our National Grange is likely to be what its motto hopes for—*Eato Perpetua*—"Let it be perpetual."

I am glad to see that dormant Granges, in the old field of my fraternal labors, California, are being reorganized, as is shown by the familiar pages of the RURAL PRESS, whose weekly visits are still most welcome in my home circle, in Alabama. Of my good friend, the RURAL, let me say with all sincerity, as of the work of the National, State, and subordinate Granges, *Eato Perpetua*.

J. W. A. WRIGHT.

Washington, D. C., July, 1887.

Bidden to the Feast.

EDITORS PRESS:—Alhambra Grange has a Harvest Feast Aug. 6th, and all Patrons are cordially invited to be present.

MRS. M. B. LANDER, Sec'y.

Martinez, July 26, 1887.

EASTERN PICNICKERS.—The fourth annual three-days' picnic of the Patrons of Delaware took place at Rehoboth beach, July 19th, 20th, and 21st, and was more largely attended than ever before. Illinois Patrons will hold their regular annual State picnic at Senachwine lake, in August, and it is to be followed by carefully planned "filled work" all over the State for several weeks.

THE Fire Relief Association (Grange), of Wayne county, N. Y., shows by its last annual report that it has \$1,760,000 of risks in force, a gain of \$340,000 over the previous year. The losses sustained within the year amounted to \$3371.75. The cost for the year was two mills on the dollar. The cost for nine years on \$1000 was \$5.23.

VALLEY GRANGE held its monthly social at Odd Fellows' Hall, Pacheco, Friday before last. The *Gazette* says that the attendance was large, a number having gone from Martinez to participate; dancing was kept up until a late—or early—hour, and all enjoyed themselves highly.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

HUGE CUCUMBERS.—Oakland *Enquirer*: In J. Hutchison's window are exhibited two cucumbers that remind one of Hercules' club. They were raised from seed imported from England by W. Hutchison, a brother of the florist, on the grounds of J. G. Eastland, in the foothills back of Temescal. They are of the variety known as the Telegraph, presumably because they aspire to attain the length of a telegraph pole. They are 21 inches long, and weigh respectively three pounds six ounces and three pounds two ounces. The seed was started in a frame, and when the plants were of sufficient size they were shifted to the open ground. Although these cucumbers are of giant size, the flesh is as fine-grained and as nicely flavored as the best of the ordinary ones procurable in the Oakland markets.

LIME VS. JUNEBUGS.—Livermore *Herald*, July 21: Julius Bohrer, who owns a fine vineyard and orchard a mile west of town, saved the apricot crop on his young trees from the Junebugs by the use of air-slacked lime. His trees were swarming with the insects, which had begun to destroy the fruit as fast as it ripened. He applied the lime by dusting it through the trees, with the result of driving away every bug and saving the remainder of the crop, unblemished.

THRIFTY VINES.—We examined Wallace Everson's vineyard yesterday. The first block is Charbono. These suffered a trifle from frost, but are well fruited and luxuriant. A portion of the vines of this variety were grafted out last season to Cabernet Sauvignon, Cabernet Franc and Petite Syrah. The growth of these grafts has been something prodigious. The main canes are from a half to an inch in diameter, while looking over the field there is very little difference between the size of the grafts and the old vines. Some have a dozen shoots each from four to eight feet long. Such a growth from a single bud in three months is almost beyond belief, and must be seen to be fully appreciated. . . . On the Crelin vineyard is a field of grafts on Charbono roots, put in last May. The growth of two months is almost beyond belief. It is the rank vegetation of a swamp rather than that of a gravelly loam. Each plant has from a dozen to 20 shoots, ranging from 6 to 20 feet in length. They are still growing with great vigor. Already cultivation is out of the question. This field is worth going a hundred miles to see.

Butte.

EARLIER YET.—Oroville *Register*, July 21: Last week we mentioned the first mowing machine in Butte. Mr. John J. Smith tells us that he ran a Hussey mower in Yuba, on the Quintay ranch four miles north of Marysville, as early as May, 1853.

YOUNG WOMEN HOMESTEADING.—Misses Fannie and Alice Orton of Berry Creek are doing what many a young man might be proud to do in the way of securing themselves homes. They each secured 160 acres of Government land and are now fulfilling the law requiring them to live upon the land and make the necessary improve-

ments. Each has a residence upon her quarter section, fences have been built and trees planted to test the land. It is found that plums, apples and prunes do splendidly, while all the small fruits reach perfection. There are many fine springs on the land.

Calaveras.

FARMS AND ORCHARDS.—Valley Springs Cor. San Andreas Prospect: Mr. Messenger is beginning anew on a portion of his old farm, having sold the improved portion to N. N. Craig, lately from Wyoming. He has planted about 300 fruit trees and a few vines, and expects to increase the size of his orchard the coming year. Mr. Craig is turning his attention to raising horses, having a number of very promising young ones now on the farm. The Morgan brothers and C. N. Stevens have planted eight acres in grapevines, which are doing finely. Mr. Nixere, lately of Tulare, has planted about 350 trees and some vines, and is also trying the bee business. Frank Costa purchased a fine tract of bottom land near town about two years ago, and planted in 1886 about 700 fruit trees, which have made such a fine growth that the eye loves to linger upon their luxuriant foliage. His success is because he diligently cultivated them. J. M. Lemon, formerly of Oakland, has a good claim and is wrestling with the chaparral problem. He is now growing about 10 acres of vines and fruit trees, which, though not irrigated, are doing as well as could be expected. His orange trees look thrifty, but are too young to be in bearing yet. He expects to plant a tract in olive trees next spring.

Contra Costa.

PRESSING HAY.—Concord Sun: Friday, July 15, Chas. Louis' hay-press pressed 29 tons 18 pounds. We doubt if any such amount of work in one day has been done outside of Contra Costa county.

THE CONTRA COSTA AGRICULTURAL SOCIETY met here Saturday. Certificates of stock of the new association are being taken rapidly. It was decided to canvass the county for a larger membership, so as to bring all points together and make a fair that will be ever remembered. No farmer, business man or mechanic can well refuse to take a share, if he has at heart the benefit of the county. The next meeting will be held at the fair grounds Saturday, July 30th.

Del Norte.

"PLENTY AS BLACKBERRIES."—Crescent City Record, July 23: Every day, men, women and children crowd the trains on their way to the blackberry fields in the logging woods. It is many years since blackberries have been as plentiful as they are this season. It takes but a short time for the vines to spring up in the woods that have been chopped over, and in a year the vines are ready to bring forth luscious fruit. Very pleasant parties are made up with the double purpose of a picnic and at the same time spending the day profitably.

Humboldt.

FROM BEAR RIVER.—Cor. Ferndale Enterprise: We are all busy from early morn to dewy eve, dairying, hay-making, etc.; also trying to entertain our many visitors from different sections of the county. We have had a very favorable year for dairying, as well as farming. I think we have the heaviest hay crops that we ever had, and a heavy growth of grass; consequently everything in the shape of stock is in fine condition, with good prospects of a fair price for butter, beef and pork, which is very encouraging to the dairyman and stock-raiser.

THE CANADA THISTLE.—Our friend Jas. Smith of Gravelly Point brought us a seven-foot Canada thistle Friday, which he cut from the Wm. Reese place on the Port Kenyon road. He says there are two bunches of these thistles on that place, the only ones he knows of in the valley. Some 20 years ago Mr. Reese sent to England for some grass seed, and in it was mixed a little Canada thistle seed, from which these two bunches sprung. It is almost impossible to kill this thistle after it once starts, and the roots grow to an enormous length. It stands every farmer in hand to know a Canada thistle when he sees it, hence we invite all who have never seen one to call at this office and take a look at the genuine article. The Canada thistle comes to stay, as the farmers on Arcata bottom can testify.

Inyo.

AN OWEN'S VALLEY FARM.—Independent, July 23: At Camp Independence S. A. Densmore has 320 acres of land. Forty acres are planted with alfalfa; this yields heavy crops each year. Forty acres are usually planted with corn, barley and wheat; crops are always heavy. There are now 175 head of cattle upon the place and the number is increasing. Ten horses are kept. Mr. Densmore now has about 2000 trees in bearing; many of these, however, are young trees, now carrying the first crop. He has already marketed some of his early apples and several of the trees have brought a return of \$20 each. He has also sold some early peaches at a good price. Twelve thousand young trees are set out, including apple, pear, peach, plum, nectarine, and other fruits, and quite a number are carrying their first crop. No one can look at the pear trees without being astonished at the quantity and excellence of the fruit. Vegetables of all kinds grow in profusion. When Mr. Densmore first began to set out fruit trees he practiced irrigation, but soon discovered that this was not necessary, and now does not irrigate his trees at all.

AN AGRICULTURAL ASSOCIATION has been organized at Bishop Creek. The articles of incorporation were filed with the County Clerk last Wednesday and bear the names of many citizens of Mono and Inyo counties. The directors are David Olds, W. C. T. Elliot, W. W. Collins, N. C. Young, Robert Love, J. R. Eldred, Andrew Dell and T. F. A. Connelly. All but two of these are residents of Bishop Creek.

Mendocino.

HERMITAGE JOTTINGS.—Cor. Dispatch and Democrat, July 15: People are jubilant over the prices realized from the sale of their wool. Large flocks of sheep are passing daily, and buying and selling is the order of the day. There is plenty of tanbark being taken to market, and it commands good prices. Pickets are in demand, as are also men to work them. It seems impossible to get men to work in the woods. The Dry Creek sawmill is about to begin sawing lumber on an extensive scale.

Merced.

A FATAL EPIZOOTIC.—Merced Argus, July 23: A disease prevails among horses and mules in this county that universally proves fatal and is becoming general on the farms and the canal works. The disease attacks the animal similarly to the distemper or glanders, but runs its course more quickly, and has proved fatal in every instance. The demand is for treatment that will not fail to cure. Henry Dewey, a large farmer near Plainsburg, says that he has lost 12 good work mules, and his neighbor, George Hannah, has lost six. The disease has broken out among the mules of the M. C. & I. Co., and farmers generally are becoming alarmed.

Monterey.

THRASHERS.—Salinas Index, July 21: Twenty steam thrashing machines are now in full blast in the Salinas valley, thrashing at least 1200 tons per day. The grain is yielding over 25 per cent better than was expected.

GRAIN AND HAY.—J. E. Heath, who farms in San Miguel canyon, raised this year 375 sacks of barley on 17 acres—over 22 sacks per acre. He also cut upward of 30 tons of excellent hay from 25 acres. Mr. Heath is a good farmer. He will plow his land soon and turn it over again before planting when the rain comes.

HORSES AT AUCTION.—T. G. Harris sold under the hammer here last Saturday, for the benefit of the Salinas bank, 24 head of horses, mostly young Norman stock. In order to give our readers some idea of what horses are worth in this section of the country, we append prices: A 3-year-old black filly brought \$175; 3-year-old gray horse, \$137.50; 3-year-old gray filly, \$142.50; 3-year-old bay filly (one eye), \$115; 3-year-old sorrel filly, \$118; 2-year-old bay filly, \$160; 2-year-old bay filly, \$140; 2-year-old bay filly, \$120; 2-year-old black horse, \$125; 3-year-old bay horse, \$102; total for the 10 head, \$1335. The other 14 head, mostly 2-year-olds, brought \$931.50, or an average of \$66.53½ each. The 24 head realized \$2266.50.

Napa.

VOLUNTEER BARLEY.—Register, July 22: Ike Orndorff harvested this year, off 35 acres west of town, 628 sacks of barley, each averaging 115 pounds to the sack. This crop was all volunteer, too.

POPE VALLEY GRAIN.—A. J. Dollarhide bought 1800 sacks for his crop, and was compelled to get 700 more. Robt. Harden, and other farmers in the valley, have also been agreeably surprised at the immense yield of their grain-fields.

Placer.

WHEAT HARVEST.—V. W. Still left at the Herald office, last Saturday week, a sample of wheat grown on the ranch of W. H. Murray, who lives on Dry Creek, in this county. The grain is large and plump, and bears no evidence of having been shrunk by the north wind. The wheat was reaped and thrashed by the combined reaper and thrasher, made by W. H. Murray and George Williams. The machine will reap 20 acres a day. Sixteen horses can run it, and only three men are required to manage it and sack the grain.

San Benito.

BARLEY IN ABUNDANCE.—Hollister Advance: Barley crops are turning out wonderfully. As the thrashing goes on it is found that the yield averages 30 bags to the acre. On nine acres near San Juan, H. Dowdy obtained 264 sacks, averaging 120 pounds each.

SOME HONEY.—John Sherman, the boss honey-raiser of Erie, will have about 15 tons of honey this season, which will bring from 14 to 15 cents per lb. in the market. John says it is an off-year for honey, too. If this be a fact, he must have kept his bees "wastlin." The honey is pure, and of a beautiful color.

FRUIT-DRIERS.—Free Lance, July 22: There are now four fruit-driers in full blast in Hollister and vicinity, with a capacity of seven tons of dried fruit daily. People now see the mistake that was made in not building a cannery this year.

THE CODLIN MOTH seems to have given San Benito county the go-by this year. The apple trees look very thrifty and are loaded with fruit, which has to be thinned extensively to keep the trees from breaking down.

San Joaquin.

CASTOR BEANS.—Stockton Independent, July 24: J. A. Sollinger of Woodbridge exhibits two spikes of castor beans grown by him. The longest is exactly two feet, and the beans are

as close and full on the stalks as it seems possible to grow. Several farmers in the vicinity of Lodi and Woodbridge, finding the experiment of 1885 successful, have cultivated from 1 to 60 acres of the beans this year. One of the pioneer cultivators says that at the price realized for the beans last year farmers can make \$35 an acre raising them.

San Diego.

LITTLE HONEY.—Viejas Cor. Record: Mr. Harbison, the famous apiarian, has a large number of stands of bees on his ranch here, but they are not making much honey. Mr. Cox, who has about 400 stands in the valley, reports but a poor yield of honey this year.

Siskiyou.

OFF SCOTT'S VALLEY.—Salmon Mountain Cor. People's Cause, July 17: This little nook is well watered, and the lands very prolific. This is mostly a stock-raising region. The farmers are busy cutting hay. Wheat harvest will not commence for two weeks yet. This is a great dairy country. Several of the ranchers milk 40 to 60 cows, and the butter and cheese made is excellent.

Solano.

THE TRACTION ENGINE A SUCCESS.—Dixon Tribune: Week before last the furnace of the traction engine was altered so as to burn oil instead of wood, and on Friday it was taken to McCune & Garnett's farm to test its capacity and practicability as a road wagon. Four "prairie schooners," loaded with 1½ tons of wheat, were coupled together and the engine moved off with them with perfect ease. The gauge showed a pressure of from 80 to 90 pounds of steam, and the train experienced no difficulty in moving up or down grade. One mile of the distance was made in 15 minutes, but such speed cannot be made with safety to such large and heavily loaded wagons. Three miles an hour can be made with perfect safety to both wagons and engine.

Sonoma.

OAT HAY.—Santa Rosa Republican, July 21: The largest crop of hay reported to have been raised anywhere this year was on the place of N. Zambellich, Sonoma avenue. From seven acres of land he obtained 28½ tons of oat hay.

HEAVY GRAIN.—Thrashing on the farm of H. M. Wilson, near Healdsburg, has just been completed, and the result was enormous. On 25 acres the average yield of wheat was 60 bushels to the acre. The average yield of barley was 90 bushels to the acre.

CHESTNUTS.—Petaluma Courier: Why don't our farmers plant more chestnuts? They grow and bear abundantly in this vicinity, and are a nut that is always salable. H. Meacham has a number of trees on his ranch on the Stony Point road that have been bearing for the last two or three years.

HOP OUTLOOK.—Democrat, July 23: As the hop-vine approaches maturity the prospect brightens. At first it was feared there would be less than an average crop, but the apprehension is likely to prove groundless, and the harvest bids fair to prove eminently satisfactory. A meeting of the Hop-Growers' Association will be held on the 30th, when the price to be paid for picking will be determined.

HORSES AT PETALUMA.—Courier: Horse-dealers and raisers, both farmers and liverymen, tell us that within the year ending July 1st, over \$75,000 have been paid for horses within the limits of Petaluma. Our farmers are all taking an interest in this industry, and Eastern men tell us that they have seen no county in the United States where stock, especially horse stock, presents a more advanced appearance in good blood than can be found in Sonoma county; and Petaluma is the principal market for them north of the bay. There are more horses selling here for from \$400 to \$500 a span than any other class.

Stanislaus.

LEMONS.—Modesto News, July 22: Mr. T. E. B. Rice brought in from La Grange three lemons, that surpass anything of the kind we have ever seen. Two of them measure 9x11 inches each, and the third 10x13 inches. The color is rich and the flavor fine. They were grown by Mr. J. A. Hammond, and of course, owe their size and beauty to irrigation. The trees have been given proper attention and all the water they required.

WHEAT AT TURLOCK.—Most of the farmers in this vicinity have got through with their harvesting. Wheat is coming in quite lively and it looks like days of yore. There has been more raised this year than many thought there would be.

Sutter.

A FINE YOUNG HOLSTEIN.—Sutter Farmer: R. C. Kells of this county sold Gen. Bidwell a 13-months-old Holstein bull calf. The animal was one of the handsomest we ever beheld. It had received no special care nor feed, but was in excellent condition. It was weighed on the Farmers' Union hay scales, and raised the beam at 905 pounds, surprising every one. Gen. Bidwell, we are informed, has always given preference to the Durhams and has been an extensive breeder of them. That he now comes to Sutter and pays \$150 for a yearling Holstein is significant.

CANNED 'COTS.—Marysville Appeal, July 22: The run on apricots at the Sutter cannery, just ended, resulted in the putting up of some 400 tons. About 5000 cases are of superior quality and intended for shipment to the East, where it not only brings a good price, but is a great advertisement.

TO REBUILD LEVEES.—The Sutter County Land Co. has resolved to rebuild and add the levees erected to protect its lands from overflow, which gave way two years ago during a high freshet. The work will be commenced early in the fall, and will involve the outlay of considerable money.

Yuba.

IRRIGATION ABOUT SMARTSVILLE.—Cor. Record-Union, July 19: When the mines were in operation many large ditches were required to bring the necessary water from the streams of the mountains, and now they are being turned to account as irrigating ditches by the Excelsior Water Co., which now has in operation 135 miles of ditches, carrying 6000 inches of water and capable of irrigating from 40,000 to 50,000 acres of land. About 15 miles of ditches were built last spring, and the work will be continued until there will not be much excuse left for the man who owns property around Smartsville and does not irrigate.

NEVADA.

EDITORS PRESS.—In Mason Valley, Nevada, the farmers are all cutting good crops of alfalfa. They had light showers July 17th and 18th, which interfered with haying. Some of them complain of being short of white labor. A great many of the natives (Pute Indians) are employed on the ranches in Carson, Smith and Mason Valleys. They are said to be good workers, but expect their pay every Saturday night or quit. W. B. Sanders, Mason Valley, has 150 acres in alfalfa from which he cuts two crops, and the rest goes for pasture. He has several acres in apple trees and some good-looking corn and currants. At Mr. Barrett's place I was shown some very fine potatoes. Mr. B. received a premium for his potatoes at the last Reno Fair.—F., Bodie, July 25th.

LIVE-STOCK TO BE SHOWN.—E. C. Hardy, of the Oasis Ranch Co., informs the Stockman that he will exhibit at the State Fair six Norman-Percheron stallions, and possibly Gallo-way bulls and thoroughbred merino sheep. It is such men as Mr. Hardy that develop an industry, and it would be well for the stock interests of Nevada if other breeders follow his example.

OREGON.

CROP PROSPECTS.—Willamette Farmer, July 22: The protracted dry weather has affected fields and gardens to some extent, but not seriously. Winter wheat is not as good a crop as was hoped, though it generally will turn off a fair yield. Spring-grown wheat is light, but oats have generally done well. It has been an unusually good season for oats, and meadows have done fairly, though an impression prevails that hay will bear a good price before another hay harvest comes. It cannot be claimed that crops in Western Oregon are first-class, though they generally are fair....Portland Rural Spirit, July 22: Several gentlemen who have had opportunity to form an opinion say that the fall grain in Willamette valley is not going to come up to expectations; wild oats are very abundant, and the spring grain will certainly be below an average.

MERINOS.—The 20 Spanish Merino rams, purchased by the Baldwin Sheep & Land Co., were taken to The Dalles by boat and sheared before starting them out to their future home. An eye-witness to the shearing and a judge of sheep informs us that he never saw the equal of these animals, as to carcass and length of wool. The breeders of Eastern Oregon are to be congratulated.

WASHINGTON.

FROM THE WHEAT FIELDS.—Willamette Farmer, July 22: Aaron Parker arrived in Walla Walla to-day and reports grain in the country back of Lewiston the heaviest crop ever harvested. He says he never saw in any country a stand of wheat so heavy for the amount of straw. The yield is estimated at 20,000 tons between Lewiston and the reservation line. The steamer Almonta is the only boat now running on Snake river. The Gates and the Spokane are now at Riparia, ready to commence removing the crop, but the efforts of the three boats will make no impression on the amount of wheat waiting shipment....It is understood here that crops in Asotin county, W. T., are burning up with intense heat. Possibly there will be a half crop. Fall-sown grain will not exceed 20 bushels, while the spring crop will fall below that figure.

MUSTERING FORCES FOR THE FAIRS.—It is announced that the supervisors of Nevada county have appropriated \$1000 from the General Fund with which to have a county exhibit of fruits, farming products and minerals at the State Fair and Mechanics' Fair. Great efforts will be made to render these displays the best and most comprehensive on exhibition. Placer and Sonoma, also, are getting ready to sustain the reputations won by their exhibits at the Mechanics' Fair in former years, while notes of lively preparations for handsome showings come from Humboldt, Santa Clara, San Luis Obispo and other counties.

We desire to acknowledge the courtesy of the directors of the Sonoma County Agricultural Park Association in sending us a complimentary ticket to their Ninth Annual Fair, which is to come off at Santa Rosa August 22d to 27th.

Booming.

From Coronado's famous beach
Where sun-lit waves are spuming,
To Monterey by coastward reach
The booming land is booming.

Like hives aswarm our hotels hum,
Where hustling guests are rooming,
And still the cry is, "still they come,"
And property is booming.

The man who sells "way up" to-day,
To-morrow finds him fuming:
"Zounds! what a chance I cast away
Just in the bud of booming!"

In dreams before our startled eyes
What prospects grand are looming!
Each day we rise to realize
The boomous boom more booming.

Our whilom grass-grown avenues
Grand city airs assuming!
There lightning's news and light diffuse,
Illuming still the booming.

With dash and vim and enterprise
See eager faces blooming!—
O Argus! lend us your keen eyes
To see whereto we're booming!

O Speculation! set your groom
Your swift steeds to grooming.
For only steed of cyclone speed
Can trot abreast this booming.

Lo, every day the priest of time
Some hobby old entombing!
I'll bet two bits against a dime,
That in the zenith of your prime,
When hope rang wildly as this rhyme
The coming pesos' pleasant chime
Above Despair's entombing,
Of all your dreams the most sublime
Weren't zero to this booming.

The poor man prays, the rich man prays:
"O Fate, forbear our dooming!"
O from our eyes wipe all dull haze!
Do thou, we beg, in mercy blaze
The path that leads where bargain lays;
O pardon all our shuffling ways
To ride this boom and make a raise!
And finally, while traffic pays,
In mercy lengthen out our days
To swell our fortunes. And the praise
Be thine forever"—booming.

—Santa Barbara Independent.

What Polly Frost Has Learned About Partnership.

[Written for the RURAL PRESS by M. P. A.]

If there is any one thing which recompenses me for my wrinkles and gray hairs, it is the wisdom I have attained with years. When Tom and I were married we were both of us laboring under a great mistake in regard to the partnership into which we were entering. Tom thought that with all his goods he did endow me, and that an undivided half of all his belongings being mine, and our partnership being for life, our interests were so united that he might venture to treat me with the same respect he would have shown to any business partner whose interests were less closely allied to his own.

Tom is not so blessed with that valuable commodity, self-esteem, but that he thinks "two heads are better than one," and so he has liked to consult me about his business affairs. He might have gone on in this way of thinking (for our friends who came to visit us, and to eat at our board, took no pains to set us right, kindly thinking if we were satisfied they could afford to allow us our little peculiarities). But we soon began to hear that the men who lounged about the store, or bar-room of the one hotel of the neighboring village, and the women who were not sufficiently occupied with their own affairs not to take a lively interest in others, said: "Mrs. Frost was going too far;" "Mrs. Frost was going to rule things;" "Mrs. Frost was wanting to run the ranch;" and we began to hear considerable sympathy expressed for Tom, though some said "Tom Frost was mean-spirited to let a woman rule him."

Now, human sympathy is a rare commodity, and I am very much obliged to these good people; but I do feel mortified to think I should have caused Tom to be called mean-spirited, and I do wish he had set me right on this matter, for having considerable regard for Tom, I usually see things pretty much as he does. I think back with surprise at some of the blunders I made before I learned wisdom of these philanthropic strangers.

Now Tom has a fashion of being from home sometimes, and one of his blunders is that he has an idea that my interests being so associated with his, I will look better to his affairs than some man who has had half a dozen homes in as many months; so when he leaves home he will say: "Now, Polly, take good care of everything while I am gone."

One of these times, when Tom was away from home, I stood by the pantry window making

pies, when I saw the hired man hitch the team (one of which was a fractious colt) to the plow, and then, mounting the more quiet horse, he started for the field, the plow dragging at the horses' heels. Now I knew that colt had very strong opinions of her own, and should the plow so much as touch her heels she would give such forcible expression to her ideas as to result seriously to all concerned; so I went out and mildly suggested that the man walk, and hold the handles of the plow, and of course the next time that man went to the village store he declared that Mrs. Frost did not allow him to ride to the field, and of course people were justly indignant.

Upon another occasion Tom was mowing and I was obliged to see about selling some butter. The hired man drove the team, and when we returned he undid the breast-straps and let the buggy tongue down, the horses still being fastened to the buggy. I am sorry to say that, knowing if those young horses started the buggy would go to pieces just as the deacon's masterpiece did, "all at once, and nothing first, just as bubbles do when they burst," I so far forgot myself as to tell the young man that it would be a little safer to undo the traces first.

In our early married life Tom sold a horse about which I felt very sorry, the more so because the \$100 he was to receive for it came so slowly, sometimes \$2.50 at one

his trip and left the little month-old colt at home. He had upon other occasions allowed it to follow its mother, but doubtless "his mind on more important matters ran" than so small an equine specimen. Now in the light of the wisdom of years I understand that the proper thing for me to have done would have been to have gone to the pasture, a mile away, and driven up a fresh cow and milked her, and proceeded immediately to bring that colt up by hand, as was Dickens' little Pip. But what I did do was to call loudly for the man to return for the colt, already calling excitedly for its mother.

Tom has a way of employing a good many men. One of these—a good, faithful soul—had a peculiarity of not being able to distinguish one cow from another, and being anxious to attend well to his work, this little peculiarity, trifling as it may seem, caused him to frequently milk the same cow over four and five times. He would seat himself, adjust his bucket and begin to milk; but after the first milking, not finding the milk, he thought the bossy failed to give it down, so he would pat her and speak encouragingly and repeat his efforts, and the long-suffering cow would remain quietly chewing her cud. Thus considerable time would be consumed at each milking, for that man's patient waiting was something marvelous. I did feel anxious to mention the fact to him upon some of these occasions, that the cow he

of the nation, like helping to put good men in authority, would be. As to this matter of the partnership between Tom and me, my mistakes really seem unnecessary, as there are many ways in which these kind people who have remarked upon my blundering would consider me an equal partner with Tom. If there is a colt or calf to be brought up by hand, any one would consider me an equal partner with Tom, and would think I should be willing to take these minor matters off his hands. Of course when the colt becomes a horse, or the calf a cow, the partnership would, to all intents and purposes, cease, for as to the selling any of the farm-stock a woman should understand that it is not considered proper for her to have a voice in the matter.

There is one subject upon which these people, who have been so shocked over my mistakes about my partnership with Tom, are very certain, and that is, that in regard to work I am equal partner with Tom; that it is my right to rise as early as he, and work as late, and when Tom's long day's work is at last finished, and he sits down to read politics, there is no one who would object to my using the extra hour of quiet to doing up the supper work and getting everything ready for breakfast, so that I might have time to milk a few more cows in the morning.

But Tom has some very old-fashioned notions, one of which is, "Woman's strength is to man's strength as sixteen is to twenty-six;" therefore he will occasionally give up his nightly reading, though he is very fond of it, and help me through with this last hour's work. Now this is very indiscreet of Tom, for if there is anything which makes people who are inclined to be a little critical decide that a man is a henpecked husband, it is seeing him engaged in the occupation of washing kettles and frying-pans, which occupation is exceedingly feminine in its character.

MORE LAUGHTER.—The man whose "Ha! ha!" reaches from one end of the street to the other may be the same fellow who scolded his wife and spanked the baby before he got his breakfast, but his laughter is only the crackling of thorns under the pot. The man who spreads his laughter through his life, before a late breakfast, when he misses the train, when his wife goes visiting and he has a cold supper, the man who can laugh when he finds a button off his shirt, when the furnace fire goes out in the night and both of the twins come down with the measles at the same time, he's the fellow that's needed. He never tells his neighbor to have faith; somehow he puts faith into him. He delivers no homilies; the sight of his beaming face, the sound of his happy voice and the sight of his blessed daily life, carry conviction that words have no power to give. The blues flee before him as the fog before the west wind; he comes into his own home like a flood of sunshine over a meadow of blooming buttercups, and his wife and children blossom in his presence like June roses. His home is redolent with sympathy and love. The neighborhood is better for his life, and somebody will learn of him that laughter is better than tears. The world needs this man; why are there so few of him? Can he be created? Can he be evolved? Why is he not in every house, turning rain into shine and winter into summer all round the year, until life is a perpetual season of joy?—*Indiana Farmer.*

NOT HONORED AT HOME.—As water seeks its level, so does the village instinctively tend to maintain a certain moral and intellectual uniformity. The man of exceptional ability is sooner or later expelled by the body politic. He is mistrusted, disliked, and finally ostracized. Nor is he himself slow to take the hint to depart. He perceives that there is nothing for him to do at home. He forges restlessly about for awhile, trying this and that, and effecting only mischief; everybody surmises an evil destiny for him; he puts on his hat and departs, in despair or anger; and presently the world recognizes and celebrates his genius. But his native village never swells the chorus of praise. They have known him from a baby; he cannot humbug them! Did he not steal apples from farmer Hoyt's orchard? Was he not the slowest hand at a spelling-match in school? Did he not jilt Mary Jane after everybody had agreed that he would marry her? Go to, then! Can such a fellow as that invent a navigable air-ship, or write a classic book, or create a successful railroad? He is only Jack Smith, after all is said and done, and, among those who know him, will always have a Jack Smith reputation.—*Julian Hawthorne, in The American Magazine.*

Window Drapery.

The engraving illustrates a rich and handsome drapery for a window. The curtains are of Madras in Persian colors, and are edged all around with tiny, fluffy tassels of floss, showing all the colors of the material. The lambrequin is of plush lined with silecia. It is mounted on a pole with rings, and is elaborated by a decoration of Karsheedt's standard satin floral applique embroidery at one side, a bunch of cord tipped with large pompons where it is plaited up, and a row of pretty pendants along the lower edges of the tab-like sides. The pattern will develop handsomely in all materials used for lambrequins. Any style of pendants may be used, and ribbon may take the place of the cord.

DRAPERY FOR WINDOW.

time, and a good share of it never came at all. Well, I so lacked wisdom that I said, in Mrs. Deacon Gay's presence, that I was sorry Tom sold the horse; but Mrs. Gay brought me to a proper sense of the impropriety of expressing opinions about Tom's affairs by saying, with severity, that she took no interest in what horses the deacon bought or sold.

I knew there were other subjects in which Mrs. Gay took no interest. She seemed to take none at all in the deacon's cooking the breakfast, so that he was often kept waiting after he had prepared the morning meal till the partner of his joys should rise, dress herself, and share with him the good things he had labored to cook and to keep warm for her. I could not help thinking (for our thoughts are sometimes unruly) that if Mrs. Deacon Gay would milk as many cows before breakfast as I had all the summer through, and then prepare the morning meal for as many persons, she might take a more lively interest in the deacon's affairs.

But returning to the subject of the mistakes I made before I learned the real state of the partnership existing between Tom and me, I used to blunder a good deal in Tom's sick spells; for Tom does have a way of being sick sometimes, and when such is the case he always seems better satisfied to have me look after things. It is a way he has, and all these philanthropic people cannot rid him of it, for it is just as sure to come with all his sick spells as the symptoms of pneumonia follow one of his colds. "Now, Polly," he will say, "look after things the best you can while I am laid up."

Upon one of these occasions Tom was in bed, and the man-of-all-work was sent from home to be gone three days. Well, the man started on

had been expending so much time upon had already been milked; but I did not know how much liberty was deemed proper for a woman to take in the green isle from whence this man had come, therefore I held my peace.

One peculiarity of a large share of the men Tom employs is, they will leave gates and bars open. Of course these men are voters, and I could hardly be expected to understand how heavily the affairs of our nation rest on these men's shoulders; therefore I must confess with mortification, I have sometimes called after a man, whose mind on some "more important matters ran" than the mere shutting of a farm gate, and asked him to close it after him, thinking more of the sad havoc the animals anxious to take advantage of the man's preoccupation would make in the growing grain or grass than of being in sympathy with the weighty matters which may have caused his preoccupation.

Now, in the light of the wisdom of years, I know that men do not take it kindly to be reminded of the minute details of life by one of the weaker sex, and I understand what my duty in such a case is, to simply adjust the meal which I may be cooking properly upon the stove (for men like their food well cooked), and to take baby under my arm, so that he will not fall into the bucket of scalding water I have had ready for the scrubbing, or meet with any other like disaster, and go quietly and put up the bars. If unluckily I am too late, the proper thing to be done in such a case is to find a place of safety for baby and go quietly and drive back the stock which has been so eager to gain the pastures new; for men above all things like quietness in women, whose weakness unfits them for bearing the heavy burdens

Woman and Her Mission.

[Written for the Press by C. J. H.]

What was she destined for by the great Creator?

I seem to hear some relic of antiquity exclaiming: "Who doesn't know what she was destined for? She was to be subject to the will of the man, take care of the house, raise children, and perform any other duty he may be pleased to assign her."

Now, that is all very well, so far as it goes; but it does not altogether satisfy a woman.

We are told that Adam was set over all that was created before him, but he had not yet a mate. So a deep sleep was made to fall on Adam and a rib was taken from his side—a bone—earth doubly refined into a form almost indestructible—and thereof the woman was fashioned. As the bone is in nowise inferior to the flesh, we infer that she was to be fully his equal, and as the bone is the prop of the body, so the woman gives form and strength to the visible as well as to the invisible body, according to her knowledge and ability.

Take a woman who is vain, selfish, given to appetite, with no self-government, vicious, and we have a very hotbed for the propagation of evil progeny. Christ said: "Do men gather grapes of brambles or figs of thistles?" Such women are human brambles and thistles, and we cannot expect much good of them.

In both the Old and the New Testament women are compared to grapevines. One of the prophets said: "Your mother is a vine within your blood, which vine hath many branches," and as a vine is a growth produced by what we term natural causes, every babe is, figuratively speaking, a branch from the parent vine. The wild grape is a very inferior and comparatively worthless fruit. It is better to let the wild vines grow together and tend them, and the same also.

Now what are we to understand from this illustration? Simply that a man of refined tastes and cultivated mind should never join himself with an uncultivated woman, nor one of evil habits and desires; for if he does he will find his own posterity degenerate, and of course he cannot be happy under such circumstances. But if perchance a man join himself to a woman of higher culture, nobler mind and greater abilities than himself, then happy is he; for his children will far surpass him and he will be justly proud and happy, at peace with himself and blessed on earth. He will find that his children have partaken of the good qualities of the parent vine and developed far beyond his expectations; that the mother-vine has exerted every energy to bring her fruitage to perfection and has perchance surpassed herself. "The builder is greater than the house, but the builder receives not the honors, but the house." It is the father's name that is handed down and glorified, not the mother's who performed the work. The mind of that parent vine goes deeper than we can see.

But Christ said it is better to let the wild vines grow together and tend them. What do we understand by that? If two persons of uncultivated minds are joined together, they do not realize their own roughness, so to speak, and so are happy with each other; and by throwing good influence around them we may bring them and their children to a higher state of culture, and so in time bring the wild vines to such utility and beauty as to be a joy to all beholders.

But where two cultivated vines are joined together, what a thing of beauty! The same hopes, joys and inspirations! "O Love divine, how pure a thing thou art!" Nothing to mar the happiness of each other, and they realize that the will of God is being done on earth as it is in heaven.

So we find that woman was not only destined to bring forth and rear the coming man, but she molds his future, either to be an honor and glory to God or the reverse, according to the light that shines in her own heart.

Then educate the woman. I do not mean in all the follies of the day, but educate her as you would educate your boys, to be a useful, thinking member of society. Fortify her mind with a knowledge of the evil as well as the good that surrounds her (she does not need to enter into all the evils as Solomon did), in order that she may not only know how to shun the wrong herself, but be a safeguard for her children and guide their tender feet in the paths of right. Her children are her treasures. We are told that had the rich man known in what watch the thief would come, he would have watched and not allowed his house to be broken into; and if the mother is forewarned just where the danger lies, she will watch with such wise diligence that the thief will have little chance to carry off her treasures captive to vice. The average man seems to think he is doing woman a kindness by keeping her in "blissful" (?) ignorance of the dangers that surround her and her little ones. He would fain believe that he is doing a deed of charity in what he terms protecting her from a knowledge of all the evils that are likely to beset her treasures at any unguarded moment; but he is mistaken. "Knowledge is power," and if the mothers be fortified with knowledge, they will so strengthen their defenses as to baffle the enemy that would carry off their treasures, even if they be not strong enough to destroy him.

YOUNG FOLKS' COLUMN.

Fan's Vanity—A True Story.

She was a beautiful black horse, with gray mane and tail. Her smooth sides shone like two mirrors, and her neck arched with that proud curve that needed no "over-check."

She was that rare thing, a perfectly sound horse, with no bad habits or tricks of temper, and with wonderful powers of speed. No touch of whip or rein was needed to urge her on, but at a soft word from her master or mistress, away she went, her shapely feet twinkling in the air.

She had known but one owner, who brought her up from a colt, and she had been petted and played with by the whole family.

From the time she was six months old she had been in the habit of coming to the house, whenever the way was open, to be fed on sugar. She also dearly loved warm doughnuts, and when they were frying her delicate scent never failed to detect it, and if she was loose in the barnyard, and the gates were open, she would come trotting up to the kitchen door and ask for one with her gentle whinny.

One beautiful summer morning her owner, on going to the field, found a handsome little bay colt lying by Fan's side, so after that she was allowed to run in the pasture lot that adjoined the barnyard. From this barnyard, a long lane, with a gate at either end, led down to the road. These gates were usually kept closed; but one day the men carelessly left them open, and, by an odd chance, the one that led into the front yard was also left open.

Fan's mistress was very busy in the kitchen, when she heard footsteps enter the front hall and pass into the parlor. She hastily wiped her hands and started to see who her visitor was; for she remembered she had left the front door wide open, so that the cool breezes might come in, and she feared a tramp had also entered, for the footfalls sounded very heavy. What do you suppose she saw when she came into the parlor?

There stood Fan and her colt before the long mirror. Fan was holding her nose close up against the glass, as though she thought her image was another horse. But her mistress said, "O, Fan, are you growing vain?"

She whinnied softly, as if to say, "Have I not reason to be?" What do you suppose she was thinking about?

Perhaps she thought, "That is a very handsome horse in there, but the colt looks very much like my own."

Tommy and the Berries.

The father sits in the garden and reads a newspaper. His hopeful, bandy-legged son toddles about hunting for blackberries. Tommy waddles up to his parent and asks:

"Papa, have blackberries got legs?"

"Of course they haven't got any legs. Go away now, and don't ask any more foolish questions when I am busy reading."

Tommy toddles around, but seems to have something on his mind. He toddles up to his father and says:

"Papa, oh, papa!"

"What do you want now, you little scamp?"

"Pa, blackberries have got legs."

"Nonsense. They haven't got legs, you foolish boy."

"Blackberries got no legs?"

"No."

"Then I has just eaten up a straddle bug."

A Busy Family.

DEAR EDITORS OF THE PRESS:—We live in Livermore valley, and my father has 320 acres of land, and we have a vineyard of 50 acres, and it will bear this year a great deal of grapes.

We have five cows. I have to milk two, and my sister has to milk one, and my brother next to me two cows.

My smallest brother has to herd pigs, and my brother has to herd horses. I am 13 years old last March. My father has taken the RURAL PRESS for 16 years, and he likes it very much.

We have vacation in our school for nearly a month. It will open again on August 1st; there will be about 40 scholars. Mrs. Gregory will teach, and I think she is a good teacher. Livermore. BELLE.

A FABLE.—Once upon a time, a bird, a mouse and a German sausage set up housekeeping together. The bird used to fly into the wood and bring back sticks to make the fire, the mouse fetched the water and spread the tablecloth, the sausage cooked the dinner. How she cooked it was in this way: when the pot boiled she dipped herself into the soup to flavor it—that was all. One day when the bird was picking sticks, he met a friend and told him about the housekeeping and how happy he was; but the friend exclaimed: "What! you do all the hard work! Make the sausage get the wood, do you fetch the water, and set the mouse to do the cooking." So next day the bird said he would not get wood any more. The sausage went out to look for

sticks, but she never came home, for a dog ate her; the bird tried to draw the water, but he overbalanced himself and fell into the well and was drowned; and the mouse, dipping herself into the boiling soup, was scalded to death. Moral: Let each person do his own work.—From the German.

BETSY FUDGE.—Betsy Fudge was a cat with a white coat. Taking her bath in the shed one day, she spied a plump sparrow, which she thought would make a nice dinner. Not noticing a tin boiler drying in the doorway, she made a rush for the bird, overturned the boiler with a crash, and away flew Betsy's dinner. Her mistress had a pair of canaries given her, whose cage hung over the piano, on which the cat had had her nap for years; but as she did not disturb the pretty birds, she was allowed to keep her old place. Winter nights the cage was put on the piano, so Betsy had to have her warm bed in the cellar. One night she hid under the sofa and did not stir when called as usual to be put to bed; but in the morning there she was rolled up like a ball against the cage, and Charley and Fanny were chirping and pecking at her in a very friendly way. After that, they spent many nights on the piano; for, though the cat caught many birds, she never molested the canaries.

GOOD HEALTH.

A MANIA FOR DOSING.—It is about time to organize a movement for preventing the intemperate use of "temperance drinks." The manner in which mineral waters, acid phosphate, "nerve food," and "lactart," are swallowed at all hours of the day, and by all sorts of men, with no real knowledge of their nature or effects, is quite astonishing, and in many cases, no doubt, almost as pernicious as the habit which it in a measure supersedes—the taking of the matutinal cocktail, the midday beer, and the postprandial wine or spirits. Much of this guzzling is due to the mania for dosing, which is almost a national characteristic. If, owing to improper eating or any other cause, a man "doesn't feel just right," the first thing he does is to take a drink of something, hit or miss, while, if he "feels bad," a dose of patent medicine, or some other nostrum, follows. Some of the preparations are, perhaps, harmless, but others are obviously of so potent a nature that they should be used sparingly, and commonly only upon the advice of a physician. To burn the stomach with acids, or purge the bowels with mineral drinks, in the hap-hazard manner often indulged in, is to trifle recklessly with the health. For a person in an approximately normal condition there is no need of either stimulants, tonics, "nerve foods," purgatives, or other disturbers of nature. Good plain food, fruit in abundance, milk, eggs, with a moderate supply of water that is cool, without being iced, or tea and coffee for those who must have "something else," constitute a summer regimen that is not improved by dosing of any kind.

HOT WATER TO RELIEVE THIRST.—It is a mistake to suppose that cold drinks are necessary to relieve thirst. Very cold drinks, as a rule, increase the feverish condition of the mouth and stomach, and so create thirst. Experience shows it to be a fact that hot drinks relieve thirst and "cool off" the body when it is in an abnormally heated condition better than do ice-cold drinks. It is far better and safer to avoid the free use of drinks below 60°—in fact, a higher temperature is to be preferred; and those who are much troubled with thirst will do well to try the advantages to be derived from hot drinks instead of the cold fluids to which they have been accustomed. Hot drinks also have the advantage of aiding digestion, instead of causing debility of the stomach and bowels.

WORMS IN EGGS.—DON'T EAT THEM RAW.—Professor Liebe adduces reliable data in answer to the question whether living worms are to be found in hens' eggs. A short time previously his sister had found a round, thread-like worm, the length of a little finger, in the white of an egg. It moved itself in a very lively manner. She at once took the white of the egg to a druggist, who put the worm in alcohol. Professor Mobius of Kiel decided that the specimen was an example of the thread-worm of fowls—*Heterakis inflexa*—often found in the small intestine of the domestic hen. Only a few instances of the existence of the same in the white of the egg have been recorded.

HOW TO TAKE TONICS.—Bitter tonics, as quinine, should be taken half an hour before meals; iron, oils and acids, after eating, that they may be digested with the food. Iodide of potassium is always given after meals; it is then said to be less liable to disorder the digestion. When a tonic is ordered to be taken, the doctor should be asked whether it is to be given before or after meals.

THE GREEN DIARRHEA OF INFANTS is, according to Dr. Hayem, caused by a microbe which secretes the coloring matter characteristic of the complaint. The disease is epidemic and contagious. The best treatment, he said in his communication to the Academy of Medicine, is to give the child after each feeding a teaspoonful of two per cent lactic acid.

DOMESTIC ECONOMY.

A "Practical" English Dinner.

Some of our readers may like to try what we see described in one of our London exchanges as a "practical" English dinner. It is as follows: Menu.

Consomme a la Royale. Salmon with fennel sauce. Epigrams of lamb and asparagus. Roast veal; salad. New potatoes. Cheese omelet. Neapolitan cake.

Consomme a la Royale.—Mix the yolks of six eggs with rather less than a gill of cold water and a pinch of salt; strain the mixture and divide it into three equal parts; color one with some cochineal, the other with spinach green, and leave the third plain. Put them into three small plain molds, previously buttered, and set these in a pan of hot water, which place on the fire to boil just long enough to set the mixture. When the water in the saucepan has become quite cold, turn out the contents of each mold on to a wet napkin, and you will have three small cakes of firm custard, respectively green, red and yellow. Cut them into small dice, and, handling them in the gentlest possible manner, spread them out on a plate to be kept till wanted. At the time of serving, put a clear and well flavored consomme (clear stock) into the soup tureen; slip in carefully the custard dice, and serve at once.

Boiled Salmon.—Take a piece of about 3-lb. or 4-lb. weight cut from the middle of the fish, lay it in the fish-kettle with enough cold water to cover it well, add plenty of salt, and as soon as the water is on the point of boiling, draw the kettle by the side of the fire and let the contents simmer gently until the fish is done (about five or six minutes). Take it up and lightly touch up the skin with a feather dipped in salad oil. To make the fennel sauce, blanch a small quantity in boiling salt water, take it out, dry in a cloth, and chop it finely; melt three ounces of fresh butter, add rather more than a tablespoonful of flour, mix well, put in pepper and salt to taste and about a pint of hot water; stir on the fire till the sauce thickens, then stir in the yolks of two eggs beaten up with the juice of a lemon and strained. Add plenty of the chopped fennel, and serve.

Epigrams of Lamb.—Braise a piece of breast of lamb in a stewpan with a little water and some onions, carrots, celery, whole pepper, salt, cloves, parsley, and sweet herbs to taste. When sufficiently cooked to allow it, pull out all the bones and put the breast between two dishes with a heavy weight on it. The piece of breast being quite cold and flat, cut it out into small cutlets; egg and breadcrumb them, then fry them a nice color in lard, and serve. Serve with asparagus in the center of the dish. Take a quantity of small asparagus (sprue), cut the edible part into pieces three-eighths of an inch long, throw them into boiling salted water and let them boil for five or ten minutes, drain and toss them in a saucepan with plenty of butter and a sprinkling of pepper.

Roast Veal.—Take from four to six pounds of the best end of the neck of veal, trim it neatly, and joint the cutlets. Put it to roast at a very moderate fire, and baste it plentifully every ten minutes, first with butter and then with its own gravy. It will take one hour and a half to two hours. During the last quarter of an hour bring the joint nearer to the fire and sprinkle it plentifully with salt. Serve with the gravy over, carefully strained and freed from fat, and with the juice of a lemon and a small piece of fresh butter added to it.

Lettuce Salad.—Wash two heads of lettuce, dry them thoroughly, and break the leaves or cut them into convenient pieces; put the yolks of two hard-boiled eggs into a basin with a teaspoonful of mustard, pepper and salt to taste, and one tablespoonful of oil; work the mixture into a smooth paste and add consecutively three tablespoonfuls of oil and two of tarragon vinegar; then add a handful of garden-cress and a little tarragon finely minced, and the whites of the eggs coarsely chopped. The mixture must be well stirred. Lastly, add the lettuce, turn it well over, and serve.

New Potatoes au Beurre.—Choose smallish potatoes and all of one size, put them in a stewpan with plenty of butter and a good sprinkling of salt; keep the saucepan covered, and shake it occasionally until they are quite done, which will be in about one hour.

Cheese Omelet.—Beat up three eggs, with pepper and salt to taste and a tablespoonful of grated Parmesan cheese. Put a piece of butter the size of an egg into the omelet-pan; as soon as it is melted, pour in the eggs, and, holding the handle of the pan with one hand, stir the omelet with the other by means of a flat spoon. The moment the omelet begins to set, cease stirring, but keep shaking the pan for a minute or so; then with the spoon double up the omelet and keep on shaking the pan until the under side is of a good color. Turn it out on a hot dish, colored side uppermost, and serve quickly. N. B.—The cheese should be of good quality and grated at the time, not the musty powder which often does duty for Parmesan.

Neapolitan Cake.—Take of powdered lump sugar the weight of 12 eggs in their shells, and take half that weight of potato flour; separate the whites from the yolks of the eggs, beat up the latter with the sugar, adding the grated rind of one lemon. Whisk the whites to a stiff froth, mix the two together, and incorporate with the mixture, quickly and effectually, the potato flour, beating it all the time with the egg whisk. Pour into a plain mold, buttered. Bake in a quick oven until done. When cold, cut the cake in horizontal slices half an inch thick. Make a strong syrup by boiling one pound of sugar with half a pint of water, add to it a little more than one-quarter of a pound of chocolate, grated. Stir the mixture on the fire until it becomes perfectly smooth. Spread half the slices of cake with apricot jam, and half with the above chocolate icing. Arrange the slices one over the other, so as to form the cake again. Trim the slices neatly, and ice the cake completely over with the chocolate icing. This must be done quickly, and the icing should be kept hot, for it soon sets. Ornament the cake with bonbons or sweetmeats, which must be put on before the icing has time to cool.

The Week.

There is much action in the affairs of the week. Wheat has sped upward, and, according to reports, farmers are quite willing to be rid of it at current rates. Shipments from the country to loading points are large and frequent. Fruit is going eastward more freely. Three full trains and numerous cars by passenger train are set down for this week's work, and daily trains are anticipated. So far as we hear the fruit is bringing satisfactory prices at the East. Canned fruit is also being shipped in considerable quantities soon after tinning. There seems just now to be a rivalry between the Canadian and our own lines which is making very pleasant prices for shippers of both canned and dried fruits. On Saturday there was a difference of about \$40 per carload in rates, the Canadian line doing that much better and getting the traffic, but lower routes propose to meet the rate. That Canadian road is a fine concern.

Crop reports from California fields continue favorable in the main, and the output for the year, counting in all values, will be large. Land matters are still active, and large sales in old and new localities are the stock items in the interior press. And still they come hungry for California land, is the remark of those who are watching incoming trains.

Unwhipped of Justice.

We chanced to be domiciled in a hotel in Sacramento during last State Fair at the time that a burglar ransacked a number of rooms and robbed a number of people. He was too smart a burglar to waste his time examining an editor's pockets, but he took considerable sums of money from other people, and in some cases from people who could ill afford to lose it and were thereby obliged to change their plans for State Fair business and recreation. It was a glaring outrage; the perpetrator was speedily caught with the spoils and with the implements of the housebreaker upon him, but he is now allowed to go unpunished because the courts are unable to secure his conviction. We are not surprised that the *Record-Union* becomes indignant at such a balk of justice. It is a disgrace to the city and to the State. The instance is fitted to call wide attention to the weakness of our courts and to the carelessness or corruption of those who should be ministers to justice instead of baffling it. It seems from the examination which the *Record-Union* makes of the machinery of justice at the capital, that the whole system is in a most unfortunate and ineffective state. The following startling arraignment of public affairs is made:

That confessed criminals go free.
That the machinery of the law is so used as to favor the escape of the guilty rather than to secure their conviction.

That the judges of the courts are powerless to prevent the outrages.

That jury lists have been chosen for the courts with carelessness, if not with culpable neglect.

That there are classes known as professional jurymen and professional jury brokers.

That jurors put themselves in the way of being chosen on panels for the express purpose of serving criminals instead of the State.

That there is sufficient cumulative evidence to justify the moral conviction that jurors are bribed; that in drawing jurors frauds may be and are perpetrated; that behind all this rottenness there is to be found the chicane of political intrigue, the greed for place, and the power of bossism of various kinds.

It is announced that professional ruffians from San Francisco aid the Sacramento rascals in fixing the box from which jurors are drawn, so that only names of those friendly to the criminal class can be taken out. We quote:

In one instance the jury ballots had been so fixed that in case any there were 14 reliable jurymen for the defense on the venire, their ballots could be produced from the box at the precise time when the prosecution had expended their challenges, and were powerless to raise an objecting voice. The modus operandi pursued in such cases is to so fold the ballots or to attach others by light mucilage to the sides of the box that they can be distinguished with certainty. Other cases analyzed develop a state of affairs equally rotten as those already enumerated. Even in civil cases instances have occurred where jurors have thrown themselves in the way of parties interested, or their attorneys, and have made propositions looking to their corruption. In our lower courts even the pernicious system prevails, and instances have occurred where, for \$50 or \$100, a man could have a panel of jurors of his own selection summoned. The most prominent detectives in San Francisco and the oldest sheriffs in the State have openly stated that, as matters now stand in Sacramento county, no conviction can be had in any case where the defendant can raise \$100, and the records of our courts for the last few years give credence to that statement.

Some such abominable methods as these are said to have prevailed in the burglar case cited above, and in some recent actions where State officers have been put upon trial for stealing large sums of money. It is claimed that the reason why the rascals get the opportunity to do this evil work is because the supervisors are not careful and scrutinizing in preparing the lists of jurors, but listen to the suggestions of ward strikers to whom perhaps they are indebted for votes, and thus the names of professional "jurors," who make a living by selling out to rascals, are brought into the panel, and afterward, by subsequent trickery, brought into the jurors' seats. This nefarious business should be done away with, and if it is not we shall have precipitated upon us again instances of popular uprisings to punish criminals such as are well known in our early history. How can such results be averted?

There is only one way in which it can be done. Right-minded people must, even at some sacrifice and against their inclination, descend into the filthy pool of politics and purify it. If a supervisor is found to be dependent for election upon a gang of whisky-sellers and

low-down fellows, let every right-minded man put forth his full strength to beat him at the polls, no matter what party he belongs to. It is not always easy to tell whether a man is honest or not, but it is safe to shun even doubtful men. It is quite easy to find men enough for supervisors who are known to be not only honest, but scrupulous and wise. It will not do in these days to be simply honest; the honest man is very apt to be hoodwinked and imposed upon. Seek out men who are wise as serpents, as well as honest; men who will not be careless or shiftless in discharging public trusts. Seek after such a man as you would for a man to lend money to or to intrust with the conduct of your business. If the elector will only apply such tests as this, we shall have no longer reason to complain of corruption and the inefficiency of courts of justice as just now seems to be the misfortune of Sacramento.

We must have a general purification of our political system. We must have the whole gang of men who live by their wits, as the saying is, swept from places of importance and trust. We must have the moral, upright, and industrious classes at the head of affairs. It can be done if every citizen will do his duty, and in no other way.

The Subscriber's Duty and Privilege.

We have a note from one of our agents in a county of which little is said in the *RURAL*, to the effect that our subscribers would like to have much more in our columns about their county. The same thing would please the editors, and we would like to consult briefly with our readers in the country as to ways in which this result can be attained.

If readers will stop and think for a moment, they will call to mind the fact that most of the accounts in the *RURAL* which describe agricultural operations and progress in various parts of the State, are written by people resident therein. The articles are in the main by those who are actually doing the things described, who are interested in improving their operations, and to this end contribute freely to the *RURAL PRESS*, knowing that their efforts will draw out similar efforts from others, and thus all will be enriched by wide experience and suggestive descriptions of practice. Any reader can claim his share in this co-operative effort for more light, and as a matter of course those most interested and most appreciative send us most, and their line of production is most fully set forth in our columns. Just at present, the fruit-growers are taking best advantage of their opportunity, but the same chance lies open to the poultry-grower, the dairyman, the sheep, horse, or cattle breeder; and no one would be more pleased than the editors and publishers to have all these groups of producers as free in their communications and discussions as the fruit men are.

Then the subject of local representation in our columns is much in the same situation. People who believe in the charms and worth of their parts of the State write us of their experience and observation. Naturally any district which has citizens who appreciate the value of the *PRESS* and are willing to co-operate in securing for their district the advantages of truthful description, secures most space. It costs them nothing but the effort at writing, and where the writer has an active faith in his locality and rejoices in its development and advancement, it is not generally hard to write for publication. We welcome the most faulty composition if it contains the truth about any part of California. It is our business to prepare matter for publication. All we want is plain statements of observation and experience. Any reader who thinks his locality is slighted has only to aid us by taking upon himself the effort to remedy the deficiency. We shall be glad to do our part, but it is beyond our means to equip exploring expeditions to set forth the truth about every part of this grand State, and the work can be done better by all readers dividing up the effort among themselves. If this be done the result will be great and the individual effort small.

We have for years invited this co-operation with our subscribers. The plan has succeeded most admirably. No agricultural journal in the world has so good a corps of contributors as we have. We count them the secret of value which makes the *RURAL* so highly prized. We have a most cordial and sincere regard for

them. We enjoy the work of setting their work before the public eye for the public good. Now any one who has the idea that his or her section is not represented has merely to whittle a pencil or dip a pen and go to work. We count it really the duty as well as the privilege of the reader to accept our standing offer and see to it that our columns are rounded out in any portion which may seem to lack.

One Great Tinder-Box.

Under the midsummer sun that has been shining warm on field and wood day after day, week after week, grass, grain and stubble, fallen twig and last year's foliage have been getting drier and drier. Save in slough and swamp, the surface of rural California is now a vast bed of tinder, ready at the slightest spark to kindle into devouring flames. And, as usual at this season, forest and field fires are reported from all directions.

Last week a conflagration at Forest ranch, near Chico canyon, had burned over a tract of valuable woodland, destroying thousands of dollars' worth of timber, and was spreading toward the flame of the Sierra Lumber Co., causing no little uneasiness. Men from Forest ranch were out fighting it. The glare from the burning woods lit up the country at night for miles around. This fire was thought to have been started by careless campers.

The week before, as a train passed the ranch of John E. Taylor, about two miles from Woodland depot, the engine "emitted a little spark that sailed gracefully away and landed in one of the big straw-stacks." As soon as the fire was noticed an alarm was given, and two or three header-crews, who had been working near, ran to the rescue. Between their efforts, and those of others who soon appeared upon the scene, the fire was prevented from spreading to the house, barns, or fields; but they could not save the straw, of which many tons were consumed. The *Mail* remarks: "This is the first fire caused by a locomotive spark that has occurred in Yolo county in many years, and farmers along the railroad should keep a sharp lookout after every train passes."

J. B. Everett's separator was at work on Frank Davis' ranch near Woodland, when the machine was found to be on fire, and in spite of all the crew could do, was burnt up, with a considerable quantity of grain. This loss is supposed to have been occasioned by matches passing through the separator, as the fire was first seen in the straw-carrier, where there are no journals of any kind to cause a fire from friction. The machine had about 25 days' more work engaged, so the employees were losers as well as the owner.

A similar case is reported from Fresno. Threshing was going on, when a blaze suddenly burst from both ends of the machine, and in a few seconds the separator was enveloped in flames. The men went to work zealously and intelligently, pulled the derrick and feeder out of danger, and then proceeded to extinguish the fire and save the unthreshed portion of the stack. The machine burned was valued at over \$1500, and was partially insured. The origin of the fire is unknown; but from the fact that it was immediately preceded by an explosion it is thought some careless person may have dropped a cartridge in the grain stack, which was ignited by the teeth of the machine.

The cremation of 75 acres of grain, three-fourths of a mile of fence and several stacks of wheat, oats and barley that had just been harvested, was charged to the combustible gunwads used by some boys who were shooting on the Wright ranch west of Santa Rosa.

Early this week 400 tons of hay were consumed at Jewett's Evergreen ranch near Bakersfield. This fire is believed to have been kindled by the stump of a cigarette heedlessly let fall by a Mexican.

These are but scattered instances among the scores that the papers are detailing. The latest telegrams speak of extensive fires raging in the redwoods west of Gilroy, in the forests of Sierra county, and in the mountains near the town of Shasta, which is threatened with destruction.

This season of tinder-like dryness is likely to last for two or three months yet; and it behooves us every one to be scrupulously careful that no carelessness of ours be chargeable with starting one of these disastrous and lamentable burnings.

Selling the Climate.

A good deal in a jocular way has been said about Californians seeking to make in their dealings with the new-comers to the State a commercial commodity of our climate. We sell these strangers the climate, it is said, and throw the land in. While not exactly true, there is, nevertheless, a modicum of truth in this saying. That the climatic conditions existing in California are to the incoming immigration a greater attraction than the land, is no doubt the case. There is land in abundance open to settlement elsewhere. There are millions upon millions of acres to be had at Government prices in other sections of the country, much of it being quite as productive as the average land to be found in this State. Why do not these people who are seeking new homes go and settle on these exceedingly cheap and tolerably good lands, a large proportion of which are well wooded and watered and far more easy of access than California? Simply because the climate there is so much inferior to ours; being, everything considered, not much better than that from which they are seeking to escape.

It is an improved climate these emigrants are in search of, and, being able to find the best only here in California, they must expect to pay for it. It is the one thing these people are most in need of; for, while they cannot live on improved climate alone, the majority of them cannot live much longer without it. Between the freezing and the frying processes to which they have all their lives been subjected, they require now exemption from these sudden changes and opportunity to recuperate their energies. After having been thawed out they ought to be kept in a comfortably limp without being again reduced to an entirely fluid condition, a thing possible of attainment only in the belt of country lying between the Sierra Nevada and the sea. No longer terrorized with apprehensions of sudden death from sunstroke, lightning, and the many other fatal agencies to which they have so long been exposed, the nerves of these misfortunates will become strong and steady, and what was before a physical wreck will become a picture of health and a model of bodily perfection.

In view of the experiences had during the past few days by the inhabitants of the States east of the Rocky mountains, the greater safety of this our California climate is not a thing to be spoken of lightly. Six hundred persons prostrated by sunstroke in the space of three days, more than 200 killed outright, is not a matter for levity, but the rather for commiseration and sorrow. If there is a country in which human life enjoys immunity from these fatalities, it is certainly the duty of all to seek there a refuge who are able to do so.

More lives were lost in the city of Chicago on the 18th inst. than have been lost by casualties of that kind on the entire Pacific Slope since it was inhabited by white men. The number of deaths in that city from such cause exceeded during three days of the present week all that have ever occurred in California from lightning, sunstroke and earthquakes put together, and yet the idea widely obtains that this is an earthquake country! Truly the climate of California, though it cannot be bought and sold by the acre, is worth a good deal as an accompaniment of the land. Rich soil and fine views can be purchased elsewhere, but rarely ever the favorable meteorological conditions that here prevail.

IMMIGRATION MOVEMENTS.—The latest advices indicate most unmistakably that we must expect a very heavy emigration during the coming year from Europe. The causes for the movement are evidently the business revival in this country and the hard times and war excitements there. This latter is particularly the case with Germany. The increasing Irish discontent will also greatly swell the exodus from that country. In the meantime the movement from the East toward California is also increasing, and will increase beyond any former precedent as soon as the winter movement sets in again. There is also good reason to believe that Central and Northern California will receive a much greater proportion of the new-comers than those parts of the State have done heretofore.

RETURNED.—R. B. Blowers of Yolo, who has been East for three months in the interest of the California Fruit Union, has returned home.

Aggressive Monopoly.

The new phase which monopoly is assuming in seizing from time to time upon the products of the country, by means of wealthy syndicates, and compelling the payment of exorbitant prices for the necessities of life—oftentimes double their real value, as in the case of coffee and some other articles of more limited product, is attracting the attention of the labor organizations. Master Workman Powderly has recently been paying his respects to these gentry in the following significant and vigorous words:

The lesson taught our members by the experiences of the past six weeks is to keep their eyes open and to keep them turned toward the Produce Exchanges of New York, Chicago and other large cities; and the moment a grain or

produce gambler stacks the cards and announces that there is a scarcity in certain articles of food, and that prices will go up in consequence, every member should resolve, and resolve out loud, that until the unbalanced hand of the speculator has been removed from the control of the article in question not a pound nor an ounce more than can be avoided will be purchased. This may be regarded in the light of a "boycott" notice. This is exactly what I intended it for, and had I the power vested in me to make the order imperative I would order every member, so far as in him lies the power, to place an eternal "boycott" on every grain and stock gambler in the United States and Canada.

The late deal in wheat by these gentry has greatly intensified public opinion in the necessity for taking some steps which will effectually prevent such demoralizing and disturbing movements. It will be recollected that wheat was held for a considerable time at such a high price that the flouring-mills of the country, both here and in the Mississippi States, could not be run except at a loss. Large foreign orders for export had also to be refused for the same reason.

For a time this great industry of milling wheat was almost at a standstill.

Our laws ought to be so constructed and construed that all parties engaged in such useless and mischievous speculations should find a speedy home in some public institution where it would be impossible for them to rob the people of countless millions by such heartless transactions, and paralyze for a time industries on which thousands depend for their daily bread. This is a problem which the people of this country will soon be compelled to face.

A Barley Grass.

We have not secured much of a treasure in one of our barley grasses, it is true, for to this

BARLEY GRASS, OR MEADOW BARLEY—Hordeum nodosum.

class belongs the pestiferous "foxtail," although there are some stockmen who prize foxtail for the early feed which their stock get from it. The foxtail is *hordeum murinum* and the grass shown in the engraving is *hordeum nodosum*. It may be familiar to some of our readers, for it is common in the Western States and Territories and frequents alkaline soils and saline marshes. Although eaten by cattle when in a young state, it cannot be claimed as of anything more than temporary value. The culms are usually 1 to 1½ feet high, sometimes in moist places reaching 3 feet, and varying as to smoothness or pubescence. The leaves are usually flat, 2 to 4 inches long and about 2 lines wide. The flowers are in a close, cylindrical spike, about 2 inches long, with three spikelets at each joint of the rachis. One (the central) spikelet is sessile and perfect; the two lateral ones are short stalked and imperfect or abortive. Each of the spikelets has a pair of empty glumes, which are narrowly lanceolate and awn-pointed, or the lateral ones may be reduced to rough bristles.

ENTOMOLOGICAL.

The Gas Treatment for Scales.

Our Los Angeles friends are pursuing the good lead which they struck in using poisonous gases for the cottony cushion scale. Mr. Morse of the University has returned to the fight on the Chapman place, and sent us the other day a box of the insects which Mr. Chapman had dosed with the gas four weeks before. We were gratified to find that the eggs had apparently been completely killed. We gave the specimen a careful examination with the microscope, tearing open the sacks and examining the contents. We found the eggs shriveled and discolored. In the sacks we found many larvæ, in some as many as 50, and all dead. It looks now as though the application would kill all hatched larvæ even before emerging from the sack, and the unhatched eggs also. We have kept the specimen during the last week under conditions suitable for incubation, but no living thing has appeared. This is much better than was anticipated, for in the earlier samples we had of the treatment the old ones were dead, but the young and eggs were in a healthy state. Of course, further observation is needed to establish such efficacy for the gas, but now it looks very promising.

We notice that the Los Angeles supervisors have set apart \$250 for continuing experiments with the gas treatment. They have rescinded their action of two years ago offering a reward of \$1000 for a perfect remedy, as the relief promises to come through public channels. Mr. Coquillette, who in connection with Mr. Craw devised a gas treatment, as was described some time ago in our columns, is continuing his work. He is now an agent of the U. S. Division of Entomology. It appears from a publication in last week's Los Angeles Herald that Mr. Coquillette is using the same material which Mr. Morse announced as an effective killing agent, viz.: hydrocyanic acid gas. Both these gentlemen seem to have had similar experience in ill effects upon the tree and both have apparently overcome it, as Mr. Morse described in his University Bulletin, by using carbonic and cyanhydric gases together. The following is a table showing proportions which Mr. Coquillette decides upon after his experiments:

Size of Tree, feet.	Cyanide of Potassium, fluid ozs.	Bi-carbonate of Soda, lbs.	Sulphuric Acid, fluid ozs.
4.....	.7	.05	.4
5.....	1.6	.11	.3
6.....	2.5	.20	1.3
7.....	4.0	.29	2.1
8.....	6.0	.44	3.1
9.....	8.5	.63	4.5
10.....	11.5	.87	6.2
11.....	15.5	1.14	8.2
12.....	20.0	1.50	11.6
13.....	25.4	1.90	13.5
14.....	31.6	2.50	16.6
15.....	39.2	2.92	20.7
16.....	47.5	3.55	25.2
17.....	57.5	4.23	30.1
18.....	67.7	5.05	35.8
19.....	70.9	5.93	42.1
20.....	90.5	6.93	49.2

The mode of conducting the treatment is as follows: The cyanide solution is prepared by dissolving 10 pounds of the solid salt in about two and a fourth gallons of water warmed nearly to the boiling point, stirring at intervals, cooling and then diluting to two and a half gallons. This solution will contain about one ounce of cyanide of potassium to two and one-half fluid ounces of the liquid.

The bi-carbonate of soda is pulverized finely and measured off in a vessel marked so as to designate pounds and fractions of a pound of the solid material. It is then placed in the generator and the dose of cyanide mixed with it, and, if necessary, a little water added to make it into a thin paste. After adding the measured dose of sulphuric acid, the pump is worked slowly at the first and more rapidly after the gas has passed into the tent. The time for each treatment must be determined by future experiments. Fifteen minutes seem to be quite sufficient when the cyanide alone is used, but it may be desirable to extend the treatment to 30 minutes when the foliage is protected by the carbonic acid gas.

The use of such an agent as prussic acid and the character of the appliances needed for its application makes it probable that insect destroying may become a business on the part of men who are competent to handle such agents. If the work proves as good as indicated by the specimens sent us by Mr. Morse, the fruit-grower can well afford to pay a good price to a professional, who will come with his outfit and treat the trees. It will be a great relief for the grower to escape the cost and bother of spraying frequently. We hope it may turn out in this way, although we must have, of course, much wider experiment to demonstrate the success of the effort.

Southern California.

[No. 7.—CONTINUED.]

San Diego and Its Surroundings.

[Editorial Correspondence.]

The city of San Diego will ever be a memorable spot in the history of California as the locality where the earliest steps in civilization on this portion of the Pacific Coast were taken. It was here that, on the 26th day of July, 1769, Father Junipero founded the first mission, which constituted the great chain of missions, which subsequently extended from thence northward as far as Sonoma, comprising 21 in all.

The City of San Diego

Is also the oldest municipality in California, having been organized as a pueblo, January 1, 1835. On the 7th of July, 1846, when the State of California passed over to the Government of the United States, the pueblo organization was maintained, and the city title to the pueblo lands having been guaranteed by the treaty of 1846, was finally confirmed by the U. S. Board of Land Commissioners in 1853. The extent of that landed area was 11 square leagues, or 32,000 acres. A subsequent effort to reduce that area from 11 to 4 square leagues was quashed by a decision of the Secretary of the Interior, made Jan. 31, 1872, and by a further act of the Legislature passed on the 23d of February following, whereby all prior conveyances of lands made by the municipal authorities were "duly legalized, ratified, and confirmed." Thus the land titles in that city are as perfect as judicial and legislative action can make them.

The Climate of San Diego

Is probably the most perfect seaside climate in the world. An official record kept at the U. S. Signal Office in that city, embracing the period from 1876 to 1885, both inclusive, shows that in these 10 years, embracing 3653 days, there were 3533 days in which the mercury did not rise above 80°, leaving but 120 days in 10 years on which it passed that point, an average of only 12 days in a year. Further, there were only 41 days on which the mercury rose above 85°; but 22 on which it rose above 90°; but 4 days on which it rose above 95°, and only one day on which it rose above 100°, and that was on the 23d day of September, 1883, when it touched 101°.

This record is a most extraordinary one for a locality a few miles below the 32d parallel, and which cuts the Atlantic States three degrees below the northern line of Mississippi, Alabama, Georgia and South Carolina! Of course there never can be anything like a "heated term" in San Diego, which has recently produced such fatal effects in most of the Mississippi and Atlantic States.

Then, taking the other extreme of the 3653 days above alluded to, there were only 93 days on which the thermometer fell below 40°; six below 35°; two as low as 32°, and none which fell below that point. On no day did the thermometer remain below 40 degrees more than two hours.

It would be difficult, if not impossible, to find any place among civilized localities on the globe averaging such an equable temperature.

In regard to high temperature it should be borne in mind that, on account of the dryness of the atmosphere, a temperature of 90° in San Diego is but a fair equivalent for 75° or 80° in any locality in the Eastern States, as outdoor work may be more comfortably carried on in San Diego at 90° than at the East at 75° or 80°.

The small comparative rainfall on the coast of Southern California also adds largely to the charm of its climate. The average number of days on which rain fell during the period alluded to was only 34 per year. There is no such thing as a "cold snap" in San Diego, as is so often met with in the more southern latitude of Florida. The cold days in Florida are produced by its being located directly on the edge of the "polar wave," which so often sweeps with such biting cold over the entire area of the Atlantic and Mississippi States, while the moderately cold days of Southern California are merely the result of dry northerly winds which sometimes sweep down over that portion of the State from the Mohave desert, bringing with them, it is true, clouds of dust, but only a very moderate degree of cold. The noonday temperature of San Diego is generally from 60° to 70° on the coast, and 65° to 80° in the interior. Its equable temperature is due to the cool ocean currents which, sweeping down the coast from the Aleutian islands, causing the uncomfortable coldness in San Francisco, but becoming gradually tempered until they reach San Diego, with just that uniform degree of temperature which gives them their best tonic influence, so valuable to all invalids except those suffering from throat and lung trouble. The latter, of course, should keep well away from even any slight dampness of the sea air, and seek repose and recuperation in the high, dry atmosphere of the interior, in localities like the upper San Gabriel valley and those beyond.

The Boom in San Diego.

Yes, there is a boom in San Diego. Perhaps it is being overdone, but when there is such a broad and fully acknowledged foundation for it, who knows? The boom at San Diego, as well as in all Southern California, is based on ample bedrock. It is a genuine business movement,

warranted both by the extraordinary influx of population in that direction and by the great commercial and business opportunities made possible by nature and largely increased by art and enterprise. The indications are most undoubted that even the large expectations of the business men there—both old citizens and those who have been but recently attracted thither—will be fully realized. There is evidently something even beyond climate—important as that certainly is—upon which to build. Its position on the Pacific touching the business of Australia and the Indies, is bound, at no distant day, to attract a large share of the business which must pass over the Pacific ocean from East to West and vice versa. Until quite recently such prospects have been merely hope and talk, but something more tangible has now fully come to pass. San Diego is already the terminus of one of the continental railroads, and another is rapidly pushing on a connecting link to share with the first corner a portion of the expectant business. Arrangements have most undoubtedly been made by which trans-Pacific steamship communication will soon become an accomplished fact. Capital is pouring in there by millions, seeking both investment and active business. It may never become anything like a serious rival to San Francisco, but it most assuredly will soon occupy a subordinate position of no small importance both as a commercial place and a seaside sanitarium. Its citizens have taken hold of the work of city building in earnest. Elegant residences are going up in every direction, first-class stores and city blocks are beginning to make their appearance in all its principal streets. Street-car lines and motor roads were the first thought, and they have been built in every direction, bringing distant points into ready and convenient communication. New hotels are also being built and old ones reconstructed and enlarged to accommodate the rush of visitors. The people are evidently in earnest, and determined that San Diego shall not be merely a paper city. It is a live town, and there is no mistake about it.

National City.

About four miles south of San Diego, still fronting upon the bay or harbor of that name, we come to National City. Here the California Southern railroad—now the Atchafson & Topeka—has its Pacific terminus, after passing directly through the city of San Diego. Here, also, that road has its machine, car and repair shops and its Pacific Coast wharves where ship and car meet. Here is everything incident to the terminus of an important continental railroad. The city proper has a frontage of some two miles or more upon deep water—a magnificent natural harbor, deep, commodious, secure, easy of entrance, with no dangerous rocks or currents, and remarkably free from fogs. Were these its only resources, the harbor and railroad would be amply sufficient to secure for the site a city of ample dimensions and large commercial importance. But aside from these are the combined advantages of a climate of the most remarkable salubrity, rich and fertile lands in its immediate vicinity, capable of producing all the semi-tropical fruits in the greatest perfection and abundance, as well as those of the temperate zone. Olives will, no doubt, be made a specialty here, as they are produced in quality and profusion nowhere else excelled.

National City and San Diego will undoubtedly, at no distant day, grow into each other and form one municipality. Contrary to the general impression abroad, such a city will have a very large back country for its support. Careful estimates have been made which show that the country has over 2,000,000 acres of mesa and valley land capable of the highest cultivation. Such an extent of land divided up as it will be, in time must contain a very large population, all of which will be tributary to the great city which must eventually grow up at the bay. We have no means of arriving at any very reliable estimate of the present population of either San Diego or National City. Both places are growing very rapidly.

The latter is already assuming quite a business-like appearance. In addition to the railroad terminal business, and its army of employees in offices, repair-shops, etc., quite a large general business is growing up. A large and commodious hotel has recently been built, a fine two-story schoolhouse, a horticultural hall, a Grange hall, several church edifices, etc. A motor road connecting it with San Diego was in course of construction at the time of our visit, which, we presume, is now in full operation. This road has been built by the Land and Town Company and will be continued through National City to other places which are being built up beyond. Several important valleys will be reached in its progress. The mode of building up towns here seems to be to put in order all the conveniences for a town, such as water, railroads, etc., and then build the town, the reverse of the mode of town-building usually adopted. National City has been laid out in blocks 250 feet square. The two principal avenues are 100 feet wide; all other avenues and streets are 80 feet wide.

Fruit Culture.

As already said, fruits of all kinds flourish in great perfection here. Among the principal orchards at National City are those of Warren C. and Frank A. Kimball, Mr. Geo. Kimball, E. and J. Steele, Messrs. Sholl, Floyd, Walker, etc. Olive culture on an extensive scale has been undertaken by Mr. Frank Kimball, who is authority on all matters pertaining to this culture. Mr. Kimball has built an oilmill, to

provide a home market for the fruit. The capacity of the mill will be increased from time to time, so as to be able to work up all the fruit that may be presented. The mill is under the management of experienced Italians, who are producing an excellent quality of oil.

Mr. Warren Kimball, with the same end in view—the development of the new city—has recently erected a planing mill, with all the appliances for turning out every kind of machine work that is needed in house-building. This mill will also be enlarged as occasion may require, until others come in to extend the industry and reap the advantages to be derived from a new and growing city.

Extent and Character of Land.

For the better handling and more ready development of the lands in and about National City, an organization has been formed and known as the San Diego Land and Water Co., which includes under its control about 50 square miles of territory, including the chief portion of the National ranch, the Otay rancho, and other portions of adjoining tracts. These lands embrace every variety of soil, and are suited to an infinite variety of cultivation. They are subdivided into tracts of 5, 10, 20, 40, 80 and 160 acres. The title to these lands is as perfect as any in the State—a grant confirmed by United States patent.

Irrigation.

Irrigation in some form is necessary for cultivation on the most of this land. On much of it ordinary wells find water at from 35 to 85 feet. So little water is needed that a good windmill will raise water enough from a single well to irrigate a 10-acre tract. In some places artesian water is found at a depth of 300 feet. But the chief source of water supply will be derived from an extensive ditch enterprise, having its initial point on the Sweetwater creek, at a locality seven or eight miles distant from the bay. A dam is in process of construction here which will be carried up to an elevation of 50 feet, which may, at any time when needed, be still further raised to the height of 80 feet. This dam will be 36 feet wide at the bottom and 20 at the top. It is now nearly or quite completed to the height first mentioned. Its length will be about 60 feet on the bottom, and 200 on the top—arching up the stream. Being constructed of huge blocks of stone and laid in cement, it will be as indestructible by floods or elements as a solid ledge of unbroken granite.

This dam will form a reservoir covering 690 acres, which will be annually filled by the melting of the winter's snow, and will furnish an abundant supply for an immense tract of country. The water will be brought down in iron pipes under pressure for both irrigation and domestic purposes.

We have no space for any special reference to the numerous enterprises of town and city building outside of the two leading localities already alluded to. Our impression is that the town lot business is being overdone. Much of the success in that direction is counted on from climate. How much that will do no one can tell, but we do know that one of the most potent aids to individual comfort and State and national progress is an equal and genial climate. Tropic heat and Arctic cold greatly reduce mental and physical energy, and consequently seriously interfere with all the various fields of activity. As we have already said the climate of Southern California, and of San Diego in particular, is most remarkably equable, and tonic in its influence. Col. Scott, the famous railroad man, and a man as thoroughly posted in general commercial matters as almost any person of his day, once said of San Diego: "I have seen many parts of the world and have made some study of this subject. It is the question of climate—of your latitude—that I refer to. You are here, in the 32d parallel, beyond the reach of the severe winters of the northern latitudes. You have a great capital in your climate. It will be worth millions to you. This is one of the favored spots of the earth, and people will come to you from all quarters to live in your genial and healthful atmosphere."

When those words were spoken but little was known to the world in general of the climate of San Diego. The facts to which he alluded have now become well known and just what he predicted is coming to pass. How long this rush will continue no one can tell. But there is a genuine bedrock for the movement, and we can see no reason for its cessation until the conditions on which it has been started have failed to exist. That can only occur when the country is absolutely filled with people who are seeking the advantages which can be enjoyed in greater perfection here than perhaps anywhere else on the globe. It is only men and women of intelligence and means and enterprise that are coming or that are wanted. It is of such that Southern California is now being built up. We dare not say that one, two or three years or more will see the end of their coming. The same inducements are constantly held out. There will never be any failure in the climate. The land may give out.

A NEW USE FOR MOLASSES.—An Austrian inventor some years since patented a method for using 1 to 1.5 per cent molasses as an agglomerate of pulverized coal or dust along with sawdust. The percentage of molasses used being very small, the expense attending its use is slight. Satisfactory results have also been obtained with pulverized coke; and it is asserted that bricks thus formed may be used for the manufacture of gas.

Can Cancer Be Cured?

We have been deeply interested in the serial papers that have appeared from time to time in the *Scientific Press* and *Millman and Mechanic* under the above caption. The fact that we have been so peculiarly circumstanced as to witness much suffering from this lethal malady may have awakened more than an average curiosity on our part. And now comes the intelligence that our old friend ex-Speaker W. H. Parks, after intense suffering for three years from a cancer on the face, has passed away.

There can hardly be a doubt that cancer is fearfully on the increase. From the report of the Registrar-General, we learn there were 80,049 deaths in England from this cause during the 10 years from 1860 to 1869, an annual increase of 248. From 1870 to 1872 the annual increase was 327. Though we have no statistics at hand, medical practitioners are generally inclined to admit this disease is alarmingly on the increase in the United States.

It seems to be more prevalent in the heated and intense life of cities than in the country; among the rich and well-to-do than among the poor. According to French authority, the proportion of cancer in France among the wealthy classes is about 106 in 1000; among the poor classes 72 in 1000, 10 per cent of the former and 7 per cent of the latter. It seems to be a morbid growth upon civilization, as it is rarely found among savage men. Like the scale and other fruit pests that prey upon our orchards and vineyards, the shadow of this baleful parasitic growth hovers around the homes of ease, luxury and high living rather than pioneer cabins, the camps and huts of miners, loggers, hunters and fishermen. Observation shows that it is fond of localities. It is said to be wholly unknown in the Faroe islands. In Iceland in one year there were only 37 cases out of 50,000 inhabitants. Considering the geographical extent of England, it is more prevalent, malignant and fatal there than elsewhere, and among English-speaking people than any other race. It is to be found more largely among women than men, and more among those who have been mothers. It is most likely to appear between the ages of 35 and 60. It stands almost alone as a disease that increases with our excited life and prosperity, and while health-laws and improved sanitation are raising the standard of health, this hideous and loathsome malady rears as a blot upon our vital statistics.

Dr. H. Percy Dunn of the West London Hospital has had great opportunity for the study of cancerous patients. In a paper contributed to the *Pall Mall Gazette*, he controverts the opinion that this disease should be classed as hereditary. Still the fact is admitted that it is frequently consecutive in certain families, but not sufficiently so to constitute hereditary quality, while all other characteristics are absent. But he seems to give away his case when he says that, while not transmissible as a disease, a predisposition may be inherited. The term is vague and hard to define. The law of diathesis is one of the most occult in medical lore.

As far as known cancer does not arise from any micro-organisms or germs and consequently is not infectious or contagious. It cannot be caught nor given. But if it be true that cancerous persons do not propagate the disease, it is almost certain they beget consumptive children; and consumption is always a result of debility, want of general health, whatever may be the immediate cause. Still, cancer often attacks persons in the most vigorous health, and consequently is hard to classify in terms of causation.

It is a sad commentary on our boasted healing art, with its rich heritage of more than a thousand years, that this disease is still classed among the incurables. Many of our most learned and widely-experienced physicians confess they have no faith in any known remedy, and believe that all that can be done is to mercifully let the wretched sufferer as softly into the grave as possible. Fowler's Solution, Chian turpentine, were at one time believed to be attended with a little success, but are now regarded with very little favor. Many will remember what a spasmodic excitement there was over Chundurango a few years ago, but it soon died away. There are a few who still think that electricity may furnish some alleviation, but as a curative agent it has but few followers. It seems to be a melancholy concurrence among medical men that no confidence can be placed in medication, and that as long as the etiology of the disease is wrapped in mystery it is a waste of time to discuss its therapy. The knife is now about the only accepted remedy with the profession throughout the world, but even that it is admitted can only avail in the incipency of the disease, and even then is liable to break out again. It is always a local disease at the start, but spreads by means of blood-vessels and lymphatics, first to the nearest gland, then more distant, and when this occurs it is no longer local but constitutional, and the surgeon with glittering knife is powerless; and at the start the cancer seems so closely allied with the tumor family that it has usually become constitutional before it unmask itself. Once in the blood it is hopelessly beyond all surgical eradication.

It is this piteous and despairing wail from cancer-beds and hospitals that invests the aforesaid papers with a new and absorbing in-

terest. Here is an array of evidence, placing beyond all dubitation the fact that there is existing in our city a specialist who has apparently a successful cancer record unknown to the medical world. The witnesses are numerous, intelligent; they are living in our midst and scattered all over the State; their names and residences are given, and their diseases in nearly every case were diagnosed by the most distinguished and conservative members of the medical profession. And it is also noteworthy that the few physicians, some seven or eight, who have been induced to make an investigation, through the humane and untiring zeal of one of our leading citizens, have in each case come to the conclusion that cancer can be cured, and almost to an absolute certainty taken in reasonable time where the barbarous and torturing knife has not been used.

Why the medical faculty of San Francisco should evince a disinclination to add these facts to their pathological knowledge is only another illustration of the many in history, of the human mind being hampered by theory, warped by prejudice and manacled by absurdly limiting and restraining rules. Vaccination had to fight its way through the prejudice and bigotry of the learned world, and there was not a physician in Europe, says Sir William Hamilton, over 40 years of age who would tolerate Harvey's theory of the circulation of the blood.

Can any good thing come out of Nazareth, is a very ancient shape of prejudice, and if this is the hindrance to a fair and honest investigation of the facts now in the court of public opinion, these learned and diplomaed gentlemen should remember that it is no strange thing for nature to pass by academies and laboratories of science and place the crown of discovery upon an obscure and unscientific head. A poor Indian, sick and wasted with malarial fever, crept to a spring on the slope of the Cordilleras in which lay a branch of bitterwood, and elaked his thirst and was cured, and hence the discovery of the value of Peruvian bark as a febrifuge. Their big dispensaries are full of remedies that had vulgar origin. The fact is, nature loves to drop pearls in the lap of the lowly and modest worker.

But it is said that this particular specialist uses secret remedies, and there is a professional impropriety in a great and learned body under such circumstances condescending to advertise her business. This is most likely the real point where the shoe pinches. It would not be difficult to show that many practitioners of the regular school, whose names stand high on the roll of fame, have used secret remedies that were not revealed till near the close of life. These learned men practice their art to make money, and as human nature is all off the same piece, we have serious doubts if there is one of them, who, if in possession of this specialist's secret, would not keep it under cover until he had reaped a rich harvest from his skill and experience. This is human nature; this is the history of inventions, and the patent office is crowded with the recipes of hundreds of graduated physicians who were not proof to the mercenary temptation. But after all this cuts a very sorry figure in the case, for the possessor of this remedy challenges the most rigorous investigation of her skill, and if a committee under the auspices of an established medical society should report favorably the means could be readily found to give this secret to the world. And there is a growing public feeling that the professed guardians of life and health should do this much for suffering humanity and not huddle on a technical propriety. This specialist's business does not need advertising, for she has all she can attend to; but suppose it did—it is no more than many members of the profession are doing every day when they send patients to oculists and aurists for treatment. But this is more than a question of dollars and cents, or even professional dignity—it is a question of life or death, and the doctor who admits that he is powerless in the presence of cancer, and lets his patient die when he has indubitable proof or even presumptive proof that there is a remedy not far away, and will not use it nor recommend its use because there is a little mystery hanging over its composition, would seem to the outside world as committing a crime little short of murder. The fact is the attitude of the faculty in relation to this matter is too silly for controversy, and stands upon the same plane as that of the Frenchman who was so exquisitely polite that he would not rescue a drowning man because he had not been introduced to him.

W. W. M.

AMERICAN HARDWARE.—The value of the hardware produced in the United States each year is now about \$60,000,000, and nearly half of it is made in Connecticut.

WILLOW FURNITURE is best cleaned with boiling water made strong with ammonia and applied with a whisk-broom.

The Cogswell Polytechnic College.

A New Technical School for San Francisco.

A few weeks since we chronicled the fact that Dr. Henry D. Cogswell, of this city, had donated property worth \$1,000,000 to found a technical school where our boys and girls may prepare themselves for the trades and vocations of life. On this page we give the elevation of the main building of this new institute of learning, the plans of which were drawn by Chas. Geddes, the architect. The structure will be of pressed brick with stone trimmings. It is to be located on the lot corner of Folsom and Twenty-sixth streets, with a frontage of 245 feet on the first-named street and 182 feet on the latter.

The building will be three stories high, and from its imposing and substantial appearance will be the most notable structure in the southwestern portion of the city. It will be 71 feet in width by 85 feet in depth, not including the projections. On each side will be a wing two stories in height, each 35x40 feet. The building will be surmounted with a high roof, covered with ornamental metal Queen Anne shingles and have handsome cresting on the ridges. In front a high tower rises to the height of

to modern skill will be introduced to make ventilation perfect. They are to be lighted with electricity, and electric bells and speaking-tubes will be run throughout the structure.

A short distance in the rear of the main edifice will be another building in which the shops and laboratories are to be fitted up. It will face to the north and be 152 feet in length by 40 feet wide, and two stories in height. The ground floor will be devoted exclusively to iron work, both designing and molding, having departments for filing, fitting and chipping. A laboratory will be established in a room 35x40 feet, and fitted with all the essentials for thorough instruction in polishing, fitting and setting up of various pieces and descriptions of machinery. A machine-tool laboratory will be 40x40 feet in size, and completely equipped with iron lathes, a drill-press, planers and rollers, by the aid of which pupils will be instructed in the arts of turning, drilling, and planing iron, so that they will be qualified to construct tools and small pieces of machinery. A forging furnace and laboratory will also be established and occupy a space 40x40 feet. The founding laboratory will be 35x40 feet in size, and contain a furnace and other necessary appliances.

The second floor will be devoted to the chemical, wood and physical departments. The carpentry department will be 40x35 feet, and be

essential to the many mechanical pursuits. A course will also be given in mechanical and architectural drawing, embracing both free-hand and perspective. Business forms, single and double entry bookkeeping, telegraphy, photography, commercial law and correspondence will also receive special attention. A notable feature of the college will be its recognition of the coming education for the preparation of progressive teachers.

The school will be open to the boys and girls of this city and State who may have completed the third grammar grade in the public schools. Tuition will be absolutely free, the endowment of the college being fully provided for by the donation of its generous founder.

The cost of the buildings alone will be some \$85,000, and the machinery and tools \$25,000 or \$30,000 more. The school will be under the personal management of James G. Kennedy as president and Mrs. M. E. Arnold vice-president, who have already been engaged to fill those two important positions. Mr. Kennedy supervised all the plans of the building and many details were suggested by him. As soon as the construction of the building is fairly under way, Mr. Kennedy will go East and visit institutions of a similar nature, study the methods of work, and ascertain just what will be needed in the shape of machinery and scientific appliances to make the school all that it should be, and all that its generous and thoughtful founder wishes to make it.

RIVERSIDE APRICOTS IN CHICAGO.—We had a call on Tuesday from L. M. Holt of the *Riverside Press and Horticulturist*. He has a good exponent of the Southern boom in his pocket and it seems to do him good. He told us several interesting things about Riverside, among them of the shipment of some apricots by Dr. Jarvis, which gave very satisfactory results as an experiment. The apricots were allowed to ripen on the trees and then shipped by refrigerator car to Chicago. They arrived in splendid condition on July 9th, and after three days' exposure after that in Eastern summer weather were still good. The Chicago people enjoy apricots which ripen on the trees more than the fruit which has to be picked so green to stand shipment. It is likely that cold shipment must become general before we can give our Eastern friends our fruit in its best condition.

IRRIGATION ISSUE IN STANISLAUS.—There seems to be considerable opposition in Stanislaus county to the recent organization of an irrigation district under the Wright law. It is telegraphed from Modesto that there was a meeting of land-owners last week at which it was decided to employ attorneys to endeavor to obtain an injunction to prevent the Directors elected from going on with the work until the matter is decided by the courts. They claim that of the 156 votes cast against irrigation, more than 150 were cast by actual and bona fide land-owners, who own 70,000 acres of land out of 108,000 comprising the district.

The same parties also claim that the Board of Supervisors went beyond their jurisdiction in taking into the district the city of Modesto, when the bill explicitly reads that only lands susceptible to irrigation shall be taken in, and that the courts will sustain them in this claim if in no other. It will be well to have such issues settled as early as possible, that methods of procedure under the Wright law may be more clear.

PROTECTING ANIMALS FROM FLIES.—At this season of the year the annoyance caused to animals by flies and mosquitoes often amounts to positive agony, and at all times, in what is called good corn weather, it is sufficient to prevent the stock eating enough to keep them in good condition. The animals will stand in the water or pass the greater part of the day in the shade, rather than expose themselves to the sunshine, going out to eat only when driven by hunger. They quickly lose flesh, the flow of milk shrinks, and a loss is incurred that cannot be easily made good again. At all times a good feed of grain is beneficial to stock, but it is especially so when flies are very annoying, since it will do much to prevent shrinkage of flesh and milk. Horses and milch cows may be protected, in a great measure at least, by wiping them all over with a sponge dipped in soapuds in which a little carbolic acid has been mixed. Bulls confined in stables often suffer enough from the attacks of flies to drive them half mad, and there is no doubt that the continued fretting caused in this way develops a savage disposition. The most satisfactory results have followed from sponging, with soapuds and carbolic acid mixed a Jersey bull confined in a stall.

FINE bunches of dates have been successfully grown and ripened upon the estate of the late Col. Hollister, in Santa Barbara county.

THE COGSWELL POLYTECHNIC COLLEGE, SAN FRANCISCO.

127 feet, the apex topped with a revolving crystal star set in a copper pinnacle. On the face of the tower, above the third-story line, will be the dial of a clock, and still lower down will be the name of the school. The main entrance is spacious and surrounded with a wide porch. On each side of the door is a niche for the placing of pieces of statuary. There are also two side entrances—one for boys and the other for girls. The main-entrance porch is approached by a broad flight of stone steps. The main hallway is ten feet wide, and opens into a cross-hallway 12 feet wide, which crosses the building from end to end. From the cross hall, stairways lead to the second story; stairs also lead to the stage at the rear and to the front of the assembly hall, in the story above. It will thus be seen that the means of egress are unusually excellent, there being three wide doorways from the ground floor to the street and two from the second story to the assembly hall.

There are to be 10 classrooms, each 28x30 feet, four to be on the main floor and the other six to be in the second story. On the first floor also will be the offices of the president and secretary, a reception parlor, a library 16x28 feet, and a museum 20x28 feet, besides a number of dressing and toilet-rooms. A spacious assembly hall occupies the entire third story. It is 68x70 feet in size and will have a seating capacity for 1000. It will be used for the delivery of scientific and other lectures in connection with the regular courses of study in the school. This hall is to be handsomely furnished and provided with a stage with all the necessary adjuncts for completeness. All the rooms are well lighted, and every appliance known

supplied with an extensive assortment of tools. A wood-turning factory will be 40x40 feet, and be supplied with lathes, a planer, a circular saw, a bandsaw, a mortise machine, a molder and several other machines. The remaining space on the floor will be at the disposal of the physical and chemical departments. One room, 20x20 feet in size, will be fitted up with shelving inclosed in a glass front, where all the philosophical apparatus will be kept that is used in experiments in chemistry and physical instruction. The furnaces in connection with this department will be in an adjoining room, 40x50 feet in size.

The department for the instruction of girls will be fully as complete in detail as that of the boys. Here instruction will be given in wood and metal carving, sewing, cutting and fitting, as well as other mechanical studies. In the basement will be well-lighted lunch-room for the boys and girls; also rooms for the janitors and others who will reside permanently on the premises. There is also some additional space which may be utilized for classrooms or shops that may hereafter be required or found desirable. All the departments of machinery will receive motive power from a 75 horse power horizontal engine, which, together with the boilers, will be of the most approved pattern.

In connection with the instruction in the mechanical arts and sciences, a four years' course of instruction will be given to those pupils who may so desire. The course will include a thorough English education, together with German, Spanish and French. Arithmetic, geometry and algebra will be embraced in the English course, and special attention given to all branches that may in any manner be deemed

TWENTY-SECOND INDUSTRIAL EXHIBITION AND MECHANICS' FAIR.

SAN FRANCISCO, 1887.

Opens September 1st, closes October 8th

The Trustees of the Mechanics' Institute take pleasure in announcing that the coming Exposition promises to be the most attractive and important to the producers of this State of any yet given.

Several Counties have already applied for space to make a general exhibit of their resources, and it is now an assured fact that the whole of the immense pavilion, with its annexes, will be filled with California's choicest productions, both natural and manufactured.

An Orchestra of 50 celebrated soloists and musicians, under the leadership of the celebrated Trombone Virtuoso, Fred N. Innes, has been engaged, and will perform each afternoon and evening.

The immense Art Galleries will be filled with choice works of Painting and Sculpture; the Machinery Hall and the Agricultural Machinery and Implement Department will contain the best and latest inventions in mechanic art.

Intending Exhibitors should lose no time in applying for Space.

Liberal Premiums in Each Class will be Awarded.

No Charge for Space, Steam or Power.

PRICES OF ADMISSION—Double Season Ticket, \$5; Single Season Ticket, \$3; Adult's Single Admission, 50 Cents; Children's Single Admission, 25 Cents.

Season tickets to members of the Institute at half price.

Full information given or sent on application to the office, 31 Post Street.

Secretary.

P. B. CORNWALL,
President.

EVERY FARMER THE BEST is the CHEAPEST HIS OWN MILLER

WE HAVE HAD
32 years Experience.

Use the Halladay Standard Geared Wind Mill, I-X-L Corn Sheller and I-X-L Iron Feed Mill and do your shelling and grinding at home, thus saving toll and teaming to and from the dist mill. This work can be done rainy days, when outdoor work is suspended on the farm. The same mill will cut corn stalks, saw wood, run churn and grind-stone, pump water, etc.

We manufacture the Halladay Standard Geared and Pumping Wind Mills, I-X-L Corn Shellers, I-X-L Iron Feed Mills, I-X-L Stalk Cutters, Horse Powers, Jacks, Saws, Galvan, Standard Hay and Trunk, consisting of Anti Friction, Reversible, Swivel and Tool Hay Carriers, Harpoon and Grapple Horse Hay Forks, Pulleys and Floor Hooks. Also a full line of Tanks, Tank Fixtures and Pumps for Farm, Ornamental, Village and Railway purposes. Send for catalogue and prices. Reliable Agents wanted in all unassigned territory.

U. S. WIND ENGINE & PUMP CO., Batavia, Ill.

H.H.H. HORSE LINIMENT.

THE H. H. H. Horse Liniment puts new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all druggists.

Windmills

Howell Mountain, Napa County.

Beautiful Mountain Scenery.

As the traveler journeys toward the upper terminus of the fair valley of Napa, he will observe, and in observing note with pleasure, the magnificent chain of mountains on the right.

It presents a striking contrast to the dry Coast Range chain in general. As far as the vision extends, its sides are ornamented with a vesture of living green, and its bold crests are surmounted by ranks of fringing pines, whose shaft-like plumes meet and mingle with the clear blue of the sky. Taking the stage at St. Helena, the ascent begins, up, and still up, over a broad and pleasant thoroughfare, until, at the summit of the main plateau, an altitude of over 1500 feet above sea level is reached. Here, traveling over the smooth road bordered for miles by a dense forest, one has time to note the wealth of beautiful trees and the various species represented, beside the variety of shrubs and lovely flowers that form a tangle of undergrowth.

Mountain Trees.

In this wondrous region are still found groves of the lofty redwood, the stately sequoia, now fast disappearing from our coast, and which threatens to become ere long an extinct tree. Most of the old monarchs have long since fallen victims to the greed and careless waste of man, but in their place groves of the young trees have sprung up, which grace and beautify the dark canyons and mountain slopes. By their side is found the feathery plumes of the lovely fir, which in spring is gay with its dress of tender green. Mingling with them both, and a very rival, is that lovely king of the mountains,

The Madrona.

And rare as it is lovely, since there are only a few chosen sections it will grace with its presence. It has been termed by some the "most beautiful of all trees," adorned as it is by its luxuriant, dark, glossy leaves, growing in cluster, and in spring covered with snowy blossoms of rare and delicate perfume, and again in winter its dark-green foliage is radiant with crimson berries, on which flocks of wild pigeons delight to feed. This tree, abounding as it does in a region of natural wonders, possesses a peculiarity not often seen in nature. It sheds its foliage in summer soon after blossoming. The dark-green leaves gradually fade to an autumn tint, and drifting down, they sweep and scurry before the summer breeze; the new growth then appears, luxuriant, green, and glossy; and so, changing from one form of loveliness to another, it stands among its companions, one of the most beautiful and most wondrous trees of the forest.

Here is also the black oak with its broad and shining foliage, the stately pine of different varieties, the maple, the alder, and the old, familiar dog-wood, besides many other trees whose names are unknown to the writer, all growing and reveling in a soil of almost unsurpassed fertility, and watered by numberless cool springs which leap from their hidden haunts and go singing on their way, over moss-covered rocks and among gigantic ferns and flowers.

Orchards and Vineyards.

During the last five years a wonderful change has occurred among these mountain forests. Many broad acres have been cleared of their dark woody growth, and vineyards and orchards now blossom in their place. Such is the quality of the grapes grown in this deep, loose soil that Howell mountain grapes are now in demand, and command a higher price than valley grapes—they are noted for their fine flavor and quality. Year by year new vineyards are set out, and more acres added to those already commenced, and Howell mountain now boasts of many fine and flourishing vineyards, besides comfortable homes, with their ample orchards and small fruits which flourish here in abundance.

So inspiring is the drive along this fascinating mountain highway, after leaving the busy marts of trade or the dry and dusty valley, that pen can scarcely describe the effect it has on one who is a lover of nature and whose soul finds companionship in its beauty.

A few miles from Helena bring us to

Conn Valley.

Or the road leading thereto on the left. The road takes its winding and devious way down hill and up and over, until it is lost to sight amid the verdant vineyards and cozy homes that lie among the undulating hills. While yet absorbed in the scenery, we are conscious of our near proximity to an open space in the forest-green meadows to the left, watered by a crystal stream, which speeds its tiny waves across the road. A short distance on, and we come in sight of the fine summer resort of

Angwin's on the Mountain.

It presents the appearance of a neat rural village hotel, dining-hall, numerous cottages, bath-houses, adjacent barns and stables, its large Chinese garden, orchard, etc., and still further on the secluded coves and dips and angles of hill and dale which comprise the camping-ground. Altogether it makes a bright picture of coziness, rest and peace; albeit there is plenty of gaiety and pleasantry among the throngs of ladies and gentlemen that are collected in groups on the verandas, or in the

shade of stately trees, and no lack of mirth and fun among the players on the croquet-ground. It would seem that here they had found their ideal of rural life realized—plenty of bright sunshine, the purest and best of cold spring water, while the air is freighted with that sweet aroma of pine, balsam, redwood, and all the brotherhood of aromatic and fragrant trees.

Oh, give me a home in the wildwood
Where the free bird singeth ever,
And the moss-green bank of the forest glade
Hangs over the rushing river,
And the grand old trees of the western land
Shall stand by my cot forever.

And there by the forest's darkling rim,
Lit up by the sun's soft splendor,
I love to live—and I live to love
With a heart as light and tender
As the birds themselves, whose winsome songs
Sweet homage unto me render.

Oh! what were the world's proud boast of wealth,
Or its fever dreams of glory,
To peace and rest in the wildwood's breast,
With the dark trees bending o'er me?
And lips I love and hearts that are true
Breathe ever the old sweet story.

The proprietor, Mr. Angwin, is indefatigable for the comfort of his guests, and has lately been enlarging and improving his dining-hall and other buildings, the better to accommodate his constantly arriving visitors. Being only a few miles from the railroad station at St. Helena, this popular summer resort has gained a deservedly high reputation, located as it is in the heart of this wonderful and fascinating evergreen mountain. At Angwin's, we are scarcely half across the mountain; and the northern slope nestling in the warm belt, where frost harms are almost unknown, with its pleasant homes, its bright and sunny people, its rich vineyards and orchards, its beauty of scenery and healing waters, with numberless attractions, will be reserved for some future article. MALLIE STAFFORD.

Vacaville Notes.

EDITORS PRESS:—The rush of apricots is over and people now have time to breathe. For three weeks they have been running in every direction to get boxes, trays and sulphur. The supply of sulphur in Vacaville gave out, and for two days in the busiest time, and the only way to get it was to borrow. Shakes were all sold at the lumber-yard for trays, and then borrowing or hiring trays was the next move. Some went 12 miles to get trays. The crop of dried 'cots between Vacaville and Putah Creek is estimated at 250 tons and will probably over-run that amount.

The driers have generally proved a failure in drying 'cots, and while many think they will do better to dry peaches, the sun is the best drier for apricots. They will be of a brighter color if dried in the sun and can be dried much cheaper.

H. A. Bassford is packing peaches to ship East and some few are sending grapes, but most of the fruit-raisers here got enough of the Fruit Union last year, and the way the Union is managed at present looks as though a few big shippers were making money at the expense of the many little shippers. Senator Buck's opinion of the intelligence of the fruit-raisers must be very low indeed if it was true that he said, as was printed in the Sacramento Bee July 6th, that they must not be told the price that the fruit sold at, as they cannot comprehend where the expense of shipping comes in.

The labor problem seems to be pretty well solved so far as white labor is concerned. Several thousand dollars have been paid out in the neighborhood to women and girls for cutting 'cots. Merchants and others doing business can already see the difference in times caused by money being paid to white persons instead of Chinese.

A man who has made a business of drying fruit for several years says that a woman will cut as much fruit as two Chinamen and give much better satisfaction in doing the work. He says he will never hire another Chinaman if he can get any other help.

Your correspondent of Tulare county speaks highly of the Peach apricot. It may do well there, but it certainly does not here. It does not bear regularly like the Royal, and while one side is soft the other will be as hard as it ever was. We have an apricot here, a seedling, which originated in Pleasant valley. It looks very much like the Royal, but ripens five or six days sooner, coming in after Thissell's seedling, and is the first freestone apricot.

The peach crop was injured by the hot north wind which checked the growth of the peaches, and a large part of the crop will only be fit to dry. Several are fixing to scald their peaches in lye, which is said to answer just as well as peeling, and is much cheaper. I think, however, there is too much lie about that process. Vacaville, July 24th. G.

CANADIAN RESTRICTION.—It is announced from the Canadian capital that a new order has been issued by the council prohibiting the importation of meat cattle from the United States into Manitoba, the Northwest Territory and British Columbia, except for breeding purposes or in transit from one point to another in the United States.

American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Mery's Pioneer Barley Crusher.

Below will be found a few of the many testimonials received from parties who are using Mery's Improved Pioneer Barley Crusher:

DURHAM, May 21, 1887.
Mr. M. L. Mery—DEAR SIR: In reply to yours of the 19th, would say that I crushed from two to two and a half tons per hour, but could crush three and a half tons per hour if my elevators were large enough to carry the barley from the machine. The No. 1 machine I used at Gridley was run on a sack a minute, but if we got behind we could run through five tons an hour, and do good work. The machine I use here is a No. 2. Yours, WM. M. TAYLOR.

GRAINLAND, Butte County, Cal., June 9, 1887.
Mr. M. L. Mery—DEAR SIR: We have used one No. 2 Roller Barley Crusher now for eight years and have used it steadily during that time; have crushed 45 tons a day, and the crusher is as good to-day as when it came out of your shop. I am satisfied that it is the best mill made. You may reconstruct this testimonial to the best advantage for you and sign our names, for you cannot overrate the merits of your mill. F. E. REAM, JOHN P. SUTTON.

CHICO, Cal., February 1, 1887.
M. L. Mery, Esq.—DEAR SIR: The 9x14 Barley Crusher bought of you and used in the California Mills, gave entire satisfaction; have crushed 8000 pounds an hour. I have also crushed as much or more on set rocks when working for General Bidwell, which set he is using in his mill to-day. Yours truly, GEO. SHAND.

TRAVEL, May 7, 1887.
We have one of Mr. M. L. Mery's Barley Crushers in use, and can say it is the best we have ever used. Having had a good deal of experience with such machinery, can say it does better and more work than any we know of. KIMBLE & GREEVE.

TRAVEL, May 3, 1887.
Having used one of the Barley Crushers manufactured by M. L. Mery, of Chico, Butte county, I can say it will do all that is claimed for it, and to those wishing an A No. 1 machine, I would recommend it as the very best. I have crushed 35 tons in 11 hours' work. J. D. GOLDEN.

M. L. MERY, Manufacturer, Chico, Cal.

The King of Soaps.

With the King of Soaps the family washing can be done as easily as any other of the household duties.

THE Oregon State Agricultural College has just issued its 22d annual catalogue. There were 110 students enrolled during the past year, but only two graduated.

DEATH OF HON. W. H. PARKS.—The death of W. H. Parks of Marysville removes a prominent figure from the political arena of California. He came early to California from his birthplace in Ohio. He was a successful farmer and stock-raiser, but was best known in public affairs. He was a member of the Assembly in 1881 and 1885, serving as a Speaker of the House during each term. He was a Director of the Drainage District, No. 1, and was elected president of the Board. He was a prominent candidate for the United States Senate, to fill the unexpired term of the late General Miller. He was a valiant fighter in the anti-debris movement. He fell a victim to the dread disease cancer, and has suffered greatly during the last ten months.

PREPARATIONS FOR THE STOCKTON FAIR.—The Stockton Independent states that the working force on the new pavilion has been largely increased, and the huge building is beginning to assume shape. Last evening the stars and stripes were floating from a flagstaff over the pinnacle on the northeast corner of the pavilion. The building will be completed in time for the coming fair. There is a feeling on the part of the people of the city and county to co-operate with the directors of the Agricultural Society in making the fair a success, and from present indications the display of the agricultural and industrial products of the district will compare favorably with any similar exhibition in the State.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Inducements to Subscribers.

To favor subscribers to this paper, and to induce new patrons to try our publication, we will furnish, to those who pay fully one year in advance of date, if requested the following articles (while this notice continues), at the very greatly reduced figures named at the right:

HORTON & KENNEDY'S FAMOUS ENTERPRISE Self-Regulating WINDMILL

is recognized as
THE BEST.

Always gives satisfaction. SIMPLE STRONG and DURABLE in all parts. Solid Wrought-iron Crank Shaft with DOUBLE BEARINGS for the Crank to work in, all turned and run in adjustable babitted boxes.

Positively Self-Regulating.

With no cone springs, or springs of any kind. No little rods, joints, levers, or anything of the kind to get out of order, as such things do. Mills in use 6 to 12 years in good order now, that have never cost one cent for repairs. All genuine Enterprise Mills for the Pacific Coast trade come only through this agency, and none, whether of the old or latest pattern, are genuine except those bearing the "Enterprise Co." stamp. Look out for this, as inferior mills are being offered with testimonials applied to them which were given for ours. Prices to suit the times. Full particulars free. Best Pumps, Feed Mills, etc., kept in stock. Address,

THE STATE FAIR

At SACRAMENTO, Cal., Sept. 12 to 24, 1887.

\$2000 in Cash for County Exhibits.

SPECIAL ATTENTION OF THE FARMING COMMUNITY

Is called, as well as the various Immigration Societies, Boards of Trade of the several Counties, and all others interested in bringing out the resources of their respective Counties, to the advantages offered by an Exhibition at the

STATE FAIR

Of the varied products of their counties. The supervisors of each county are invited to make a liberal appropriation, sufficient to pay the expenses of getting together an Exhibition of County Products. Premiums received can be returned to the treasury of each county making the appropriation, so that their respective counties would be written up and advertised at a small expense by an exhibition of this character. The Railroad Company transports the same free of charge.

THE LIVE STOCK EXHIBITION, connected with the State Fair, is sure to attract Eastern visitors anxious to view the resources of California.

APPLY FOR SPACE AT ONCE, as the Society is willing to devote the entire exposition building, if necessary, to displays of CALIFORNIA PRODUCTS. A NEW FEATURE has been added to the Premium List this year, in the shape of awards for a Sheaf Display of Cereals. Forty Sheaves, not less than 10 inches in diameter, of 10 varieties of grain are called for. Not necessary to be grown by exhibitor. Notice is now given that samples may be gathered during harvest, and laid away for exhibition. Address the Secretary for Premium Lists and other information.

S. H. MARKET REPORT

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, July 27, 1887.

Continued fine harvest weather insures the gathering of all kind of cereals and farm products in most excellent condition. The bulk of the grain has been cut and thrashed, and now farmers are delivering as fast as possible so as to take advantage of the present prices. Eastern markets have fluctuated considerably the past week. European markets have ruled quiet and weak. To-day's telegrams are as follows:

LONDON, July 27.—Wheat off coast, dull; wheat on passage, inactive; just shipped, 39s; nearly due, 39s; Mark Lane, English and foreign wheat, weaker; Mark Lane, English and American flour, quiet; Liverpool spot, steady, at 6s 11d to 7s 2d. English country markets, quiet. Wheat on passage to U. K., 1,890,000 qrs; to continent, 525,000 qrs.

Foreign Review.

LONDON, July 25.—The *Mark Lane Express*, in its review of the British grain trade during the past week, says: "The continued drought is rapidly maturing wheat. Part of the Southern crop is already out. If the dry weather holds, the whole crop will be harvested and thrown on the market, and prices will decline to zero. On the other hand, if rain sets in, the grain will have a chance of being converted into pig's feed. This will result in a spurt of trade, but there is wheat enough in the world to again bring values below the present level. The English wheat-grower stands irretrievably ruined whether his wheat goes to a straight market or to the rats. Trade is sick unto death. The sales of English wheat during the past week were 24,199 quarters at 34s 3d, against 27,295 quarters at 31s 3d during the corresponding week last year. Trade in foreign wheat is on the smallest possible scale, values are in the buyers' favor and Liverpool prices are down 1d per cental. There were four arrivals of wheat cargoes and two sold. Four cargoes were withdrawn and three remain. At to-day's market there was no inquiry for wheat. Flour was a fraction cheaper. Oats were firm. Corn, beans, peas and linseed were unchanged.

NEW YORK, July 23.—The Produce Exchange's weekly review of the condition of the world's grain market says: "Latest advices from the United Kingdom represent the wheat crop in excellent condition and making rapid progress toward maturing. Barley, oats, peas and beans have, however, suffered from drought, especially on light, sandy soil. Wheat on passage from India, July 5, is estimated by *Beckham* at 8,696,000 bushels, including 5,512,000 bushels to the United Kingdom and 3,184,000 bushels to the continent. Of the quality on passage to the United Kingdom 3,256,000 bushels are from Calcutta and 2,256,000 bushels from Bombay and Kurrachee. One year ago the quantity afloat from India was 7,720,000 bushels, comprising 5,632,000 bushels for the United Kingdom and 2,088,000 bushels for the continent.

Crops at the East.

CHICAGO, July 24.—The *Farmer's Review* this week will say: "While the local rains in some localities have come in the nick of time to save the corn crop, our reports this week indicate that the drought has lowered the average condition of crops in almost all the States reporting. The winter wheat yield in different States, according to reports by our correspondent, is as follows: Sixteen counties in Illinois have an average of 16½ bushels; ten counties an average of 16½; ten counties in Missouri, 18½; 14 counties in Ohio, 15½; 11 Kansas counties, 14. Considerable damage to spring wheat by chinchbugs is reported from some districts in Wisconsin, Iowa, Minnesota, and Nebraska.

Eastern Wheat Markets.

NEW YORK, July 24.—Wheat closed heavy—July, 80½c; Aug., 80½c; Sept., 82½c; Oct., 83c; Nov., 84½c; Dec., 86½c.

CHICAGO, July 27.—Wheat, firm; cash and August, 69½c; Sept., 72 3/16c.

Eastern Wool Markets.

NEW YORK, July 24.—The market is without special animation. Among sales were 80,000 lbs California spring, private terms; 40,000 lbs Oregon at 20½c; 40,000 lbs Territory at 21½c.

The Boston market shows some improvement. Among sales were 472,000 lbs spring California at 19½c; 25,000 lbs fall California at 13½c; 153,000 lbs Territory at 19½c; 40,000 lbs Oregon, part at 17c.

The Philadelphia market continues dull. Among sales were 67,000 lbs fine medium Territory at 21c; 32,000 lbs Territory, fine, at 19½c; 1500 lbs Territory, bucks, at 13c; 2000 lbs Territory, low, at 19c; 2500 lbs three-eighths Territory, at 25c; 2000 lbs three-eighths Territory, at 21½c; 5000 lbs Territory at 19c.

California Products at Chicago.

CHICAGO, July 25.—California green fruit arriving is in good order and has a good demand, except for netberries, which are green and in poor order and not wanted. Large ripe plums have good demand, while small varieties, such as Hative, are not wanted. Bartlett pears are selling fairly at \$2.50@2.75 per box. Early Crawford peaches in 20-lb boxes bring \$1.75@2 plums, \$1.75@2 per 20-lb crate, German prunes, \$2@2.25, and Sweetwater grapes, \$1@1.25. These prices are about the average obtained for fruit in good condition, while inferior lots sell for less.

CHICAGO, July 26.—Several carloads of California green fruit were received here to-day and it was nearly all disposed of before dark. The fruit consisted mostly of pears, which are in splendid condition. With the exception of some few peaches and Sweetwater grapes, all the fruit was in fine order. The pears brought \$2.65@2.75 per box. Sound peaches sold at \$2 per box, while fruit of that variety in off condition brought a dollar less, having to be repacked. Columbia plums were in good shape at

\$1.40@1.50 per box; Sweetwater grapes, \$1@1.50.

California dried fruits are quiet. A few apricots have been received. The market is rather quiet and fully settled. Pitted plums, evaporated, 10@11c; do, sun-dried, 10@10½c; apricots, evaporated, future delivery, 14½@16½c; do, cash, 16½c; prunes, 9@11c; raisins, London layers, 20-lb boxes, \$1.30@1.40; do, loose Muscatel, \$1 box, \$1.15@1.25; do, California layers, \$1.15@1.25.

Reports from the Pacific Coast concerning hops show that dry weather is said to be doing some damage to that crop there, but up to this time the outlook has been good. Spot goods are selling in a small way at 18@20c for California grown.

California Fruits in New York.

NEW YORK, July 23.—A carload from Sacramento was sold at auction to-day at the following prices: Bartlett pears, \$1 box, \$3.25; Crawford peaches, \$1 box, \$1.75@2.60; assorted plums, \$1 box, \$2.60@2.70. Bidding was lively. Saturday is the poorest day in the week for selling fruits. No auctions of Mediterranean fruit are held that day.

NEW YORK, July 26.—The auctions of the Fruit Union have attracted the attention of everybody interested in California fruits. To-day one carload of Bartlett pears sold, at private sale, at \$3@3.25 per box.

Local Markets.

BAGS—Several large short sellers filled at higher prices. The market is barely steady at 7@7½c.

BARLEY—The market on Call gradually settled up to Monday, when a steadier tone was noticed. It looks as if large operators are buying options. Receipts continue free. At to-day's Call sales were as follows:

Morning Session: Buyer 1887—100 tons, \$1.10½; 800, \$1.10½; 200, \$1.10½. Seller 1887, new—100 tons, \$1.20, 99½c; 300, 99½c; 100, \$1 per ct. Afternoon Session: Seller 1887, new—100 tons, \$1.10, 99½c; 300, 99½c; 100, 99½c; 100, 99½c; 200, 99c. Buyer 1887—500 tons, \$1.10½; 300, \$1.10½; 300, \$1.10½ per ct.

BUTTER—The market for gilt-edged is very strong under light receipts and a good demand. Some pickled and also solid are being sent off on orders.

CHEESE—Although supplies are liberal, still the market has a firmer tone.

EGGS—Strictly choice fresh laid continue scarce and in demand at full figures, but Eastern and poor Californian are hard to sell.

FLOUR—The market is very strong for the better known brands. The demand is confined to actual wants.

WHEAT—The syndicate steadily advanced options throughout the week; each day the shorts thought would be the highest, still the end was not to-day, but it now looks as if it is near at hand. The pool will call for 20,000 tons of buyer options within a day or two—so says report—which makes the shorts do considerable work to meet. One large short seller is said to have already put up over \$300,000 to keep his margins on seller contract good; he sold seller '87 option and as long as he keeps his margins good he cannot be forced to fill. To-day's sales on Call are as follows:

Morning Session: Seller 1887—500 tons, \$2.06½; 100, \$2.06½; 100, \$2.06½; 500, \$2.07. August—100 tons, \$2.06½; 100, \$2.06½. Buyer August and September—100 tons, \$2.12 per ct. Afternoon Session: Seller 1887—300 tons, \$2.07½; 100, \$2.07½; 300, \$2.07; 600, \$2.06½; 200, \$2.06½; 200, \$2.06½; 100, \$2.06½; 1200, \$2.06; 400, \$2.05½. August—100 tons, \$2.07 per ct.

[COMMUNICATED.]

Market Information.

Cereals.

European mail advices regarding wheat crops are as follows: In Italy and Spain, the month of June has forced the grain into a maturity which lacks one of the most important elements for making a good crop, namely, gradual growth. Shriveled kernels are the natural result of a month of tropical fever following on a bleak and untoward spring. Italy, which is an important wheat-buyer from India and Russia, is likely to repeat in 1887-88 the considerable orders of 1886-87, while Spain may also be a purchaser of foreign wheat. The wheat crops on the continent are now of very fair promise in those parts where harvest is just beginning, namely, France, Austria-Hungary, and the winter wheat districts of southern and central Russia. In France, great heat has been accompanied by thunderstorms, which have, however, cooled the air without bringing rains heavy enough to beat down the crops. The French wheat-fields have enjoyed an extraordinary favorable earing and blooming time, the air everywhere being still as well as warm. The French wheat crop is now estimated as likely to yield 2 qrs. to the acre on 17,500,000 acres, or 35,000,000 qrs. (101,500,000 hectolitres). This quantity, however, may easily be exceeded to the extent of 3,000,000 qrs. (8,700,000 hec.), or more, if July prove uninterruptedly fine, and the perfect development of the wheat in the great wheat-growing districts of the north, northwest and northeast be favored. The existing outlook being favorable, an out-turn of 37,000,000 qrs. (107,300,000 hec.) would not perhaps be an unduly sanguine estimate. The wants of the French people are about 40,000,000 qrs., and the imports in an average year now equal about 5,000,000 qrs. The Austrian harvest is variously estimated as likely to yield from an average to 5 per cent above the mean. In the winter wheat districts of Russia the past month has been hot, but with frequent showers! Here and there, indeed, the rainfall has been too heavy, but this has been the exception and not the rule. Russia has at present a fair promise of an average yield of spring wheat, while the winter wheat crop will be a great improvement of the poor out-turn of last year.

In estimating on the European crop and probable requirements, one very important fact should not be lost sight of, that is, the very light reserve held by both the supply and demand countries. This will more than offset any increased yield over last year. India's crop is 2,000,000 qrs. (16,000,000 bushels) less than last year's. In the United States the new crop of spring wheat, though covering 6 per cent more area than in 1886, promises in consequence of drought, the Hessian fly and chinchbug ravages, a smaller aggregate output than the 146,000,000 bush-

els of 1886. The winter wheat crop with a per cent decreased area in 1887, and important deficiencies in several of the large wheat-growing States, will have a diminished aggregate output as compared with the crop of 1886, which was 301,000,000 bushels. Returns from four winter-wheat States alone show that the deficiency may reach 20,000,000 bushels. Incomplete reports from seven other winter-wheat States also indicate a diminished output of about 20,000,000 bushels.

From June 30 to July 1 the exports of wheat from the United States compare as follows: 1886-87, 153,816,862 bushels; 1885-86, 94,741,720 bushels. To ship the former, although the crop was largely in excess of that of 1885, the usual carryover or reserve stock was reduced to a lower figure than for many years. It is claimed by well-informed writers and operators that the United States will not be able to ship over 85,000,000 bushels this season. If this proves correct then prices must advance abroad before the close of the year.

Were it not for the bull movement in this market No. 1 wheat would not now sell at over \$1.20@1.25 per cental and No. 2 at over \$1.10@1.15; and yet some so-called friends of farmers are crying down the movement and doing all they can to break the deal.

The Eastern wheat market continued to decline up to Tuesday, when it began to recover. The Chicago house of S. S. Floyd & Co. of this city telegraphed that cash wheat on Monday sold at 67½ cts per bushel. This is the lowest figure at which it sold for over 24 years. On Tuesday the market gained strength, owing to heavy buyers coming in. The New York Produce Exchange Reporter says: "Wheat is being sold too low; no country in the world has any reserve of moment of old wheat, and with the steady increase in its consumption from year to year, it cannot be denied that with a crop this season of about 400,000,000 bushels, we are selling our wheat very low. The wants of the country are not less than 345,000,000 bushels, the increase in population and in the wants of manufacturers considered, so that to retain any reserve at the close of the year we shall not have anything like our usual quantity for export; hence the situation we regard as very important and full of interest."

In this State the bulk of harvest work is finished. The wheat now being cut is said to show better than that harvested early in the season. Buyers continue to take freely all the better grades of wheat on the basis of \$1.90 to \$1.95 per cental delivered here. No 2 shipping wheat is also being bought up. Fair receipts of Walla Walla wheat are coming forward, but the grade, as a rule, does not come up to buyers' wants.

From the New York Produce Exchange Reporter of July 16th, we obtain the following: "An arrival of 16,000 bushels of Walla Walla wheat via the Northern Pacific railway, was quite a surprise to the trade, because at the prices current for it in the Walla Walla valley it cannot be placed here to any advantage at present rates of freight. It was sold at 80c delivered, which is a low price for so good an article."

The corn crop of the West, although not quite so favorable looking, promises a decided increase over last year. The stock of old corn at the East is very light. The corn market with us is fairly steady.

The barley market has ruled quiet weak, with lower sales reported. A large operator is said to be quietly buying all the options he can on Call without advancing prices. A further reduction in freight by the Pacific Mail Steamship Co. on barley to New York has created an increased call for brewing grades. Advices from the East report the barley crop, with the quality, not up to former seasons.

Free receipts of oats cause a weak market at lower quotations. The grade shows an improvement on former receipts. The demand is light, owing to buyers waiting for lower prices.

This season's standard of wheat, barley, etc., has not been fixed by the Produce Exchange yet, but samples are being received for that purpose. No 1 shipping wheat for the season of 1886-87 weighed 61 lbs to the bushel, and for 1886-87, 60½ lbs.

S. S. Floyd & Co.'s Chicago telegram received to-day reports August wheat opened at 69½c, advanced to 70½c and closed at 69½c; September opened at 71½c, fluctuated between 71½c and 71½c, closing at 71½c.

Estimated crop of wheat, without rains, for 1887 in the United Kingdom is 96,000,000 bu, or about 30,000,000 bu larger than 1886, and 14,000,000 bu larger than in 1885. The average crop is about 75,000,000 bu.

Feedstuff.

Bran and middlings are still scarce, but the demand is less urgent, owing to the relative cheapness of rolled and also ground barley. The latter appears to be gaining in favor among consumers.

Hay, if choice, finds many buyers, but the poorer grades are slow. The crop this year is undoubtedly short of last year, but it averages better. The consumption is about double that of 1886.

Fruits.

Receipts of apricots and peaches are the heaviest within the history of the trade. Canners are, in consequence, masters of the situation. The pack of both will be all of double last year's. Canners pay 1 to 1½c per lb. for apricots, and the same for peaches. Plums are sold at from 1½ to 2½c per lb. Canners clean up the market daily. No egg plums yet.

Pears continue in liberal supply, with lower prices ruling. Canners are not in the market yet for Bartlett's, owing to their being held too high; but as receipts are increasing, it is thought dealers will have to soon begin to clean up to them.

Berries are in free supply, but prices keep well up, owing to the large increased consumption.

Grapes are in free supply, but the quality is, as yet, only fair, but lately they have been improving. Muscates are making a little better showing.

Dried apricots are coming in in large quantities, but they move off equally as free, under liberal buying from distributive points at the East. Peaches are beginning to come in by samples.

The stock of raisins is worked down to a low point. The demand is slow, as buyers are waiting for the new pack later on.

Eastern advices report a light apple crop, as they also do of cherries, berries and pears. The cherry crop was almost a total failure. All this will have their influences on dried fruits.

Live-Stock.

Choice condition bullocks are in better inquiry,

with an advance asked, but butchers are slow in paying it. The supply of other kinds is not so free. Mutton sheep are in fair supply. The tendency appears to be to stiffer prices. Hogs, if grain-fed, and in good condition, find ready buyers, but poor hogs are slower. In work-horses, there is nothing doing. For roadsters and general utility horses the demand continues free.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 7@7½c; first grade, grass fed, 6½@7c per lb.; second grade, 6c; third grade, 4½@5½c.

MUTTON—Ewes, 5@5½c; wethers, 6@—c.

LAMB—Spring, 7@8c.

VEAL—Large, 6@7c; small, 6@8c.

PORK—Live hogs, 4½@4¾c for heavy and medium; hard dressed, 7@7½c per lb; light, 4½@4¾c; dressed, 7@7½c; soft hogs, live, 3½@4c. On foot, one-third less for grain or stalled, and one-half less for stock running out.

Vegetables.

Potatoes, if choice and well matured, move off well at quotations, but poor qualities slow. The crop this year turns out better than that of 1886.

Onions are barely steady at quotations, and supplies are liberal, with a fair demand ruling. Hard keepers are in request to fill distant orders.

In roots there is nothing new to report outside of free receipts and a fair demand.

Cabbages rule steady at the lower quotations.

Tomatoes are coming in more freely, causing prices to shade off. Some consignments had to be cleaned out at low prices to canners. Heavier receipts are looked for from now on.

String beans continue to be received, but the demand is slow.

Green corn is in liberal receipt, but prices keep fairly steady under a good demand.

Other reasonable vegetables are in good supply, with the market ruled from day to day by the supply and demand.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.....	300,286	323,571
In port, disengaged.....	74,731	31,961
In port, engaged.....	40,239	39,101

Totals.....415,256 394,633

The above gives a carrying capacity as follows: 1887, 659,740 short tons; 1886, 631,412 short tons; increase over last year, 28,328.

The past week, over 1,250,000 lbs of the better grades of wool were sold, leaving the poorer grades on hand for which buyers bid down.

Hops, if gilt-edged, are quickly placed, notwithstanding buyers talk them down. Brewers are lightly stocked, while the crop is very irregular in yield and also in quality.

Poultry ruled quiet, but firm throughout the week, with the better conditioned scarce.

Hams and bacon show another advance, in sympathy with the higher market at the East.

San Francisco, July 27, 1887.

Domestic Produce.

Extra choice in good packages fetch an advance on top quotations, while very poor grades sell less than the lower quotations.

SMYRNA FIGS.—Mr. W. C. West of Fresno, whose lively interest in fig-culture is well known, favored us with a call the other day. The reports, from whatever source, that "Smyrna figs are much like Florida oranges, consisting of many varieties, but seldom true to name, etc.," he pronounced incorrect. His own recent journey to those regions of Asia Minor whence come the best figs known to commerce, his studies there, and the carefully chosen and guarded nursery-stock which he brought home with him, are, to Mr. West, sure grounds for believing that he has, at last, secured the genuine article. He is confident of demonstrating the fact shortly.

OLIVE OIL FROM SONOMA.—Among our Agricultural Notes for May 14th it was stated that Col. Geo. F. Hooper of Sonoma had brought to Santa Rosa samples of fine oil made from olives grown in his own grounds on trees sprung from cuttings which he planted 10 years ago. The *Republican* added: "To Col. Hooper belongs the credit of having produced the first ripe olives and made the first pure native oil in Sonoma." One day this week there came to us, with compliments of the gentleman aforesaid, a bottle of the oil in question, and we take pleasure in testifying to its beautiful clarity, its richness and delicacy of flavor.

Grape Crushers.

MADRONE VINEYARDS,
GLEN ELLMAN, CAL., July 10, 1885.
GEORGE L. WENZEL, Esq., 309 Fulton St., S. F.—Dear Sir: When I bought one of your Grape Crushers and Separator, last fall, I promised that after I had fully tried it, I would write you whether it gave satisfaction or not. I crushed and stemmed my entire vintage of 1884—consisting of upward of 500 tons of grapes—with the machine you sold me, and it gives me pleasure to say that it did its work most satisfactorily. With two men to turn, I found that I could crush and stem from 25 to 30 tons of grapes per day, on your machine. I consider that the superior quality of my red wine of last year is largely due to the fact that the stems were thrown out by the stemmer, and not allowed to run through the crusher, as is usually done with other machines. Very respectfully yours,
ED. T. SHEPPARD.
Advertisement of Mr. Wenzel will be found elsewhere.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

MINERS FINED.—Judge Sawyer has fined the Milton Water and Mining Company \$500 on each of two charges of violating the injunction issued by the United States against hydraulic mining granted in the case of Woodruff vs. North Bloomfield Mining Company and others.

BOUND VOLUMES.—Back files of this paper bound in substantial cloth binding with leather back, containing six months' numbers in each, indexed, can be had at this office at \$4 per volume.

AN INGENIOUS TEST.—In a large factory one of the workmen carelessly allowed his hammer to slip from his hand. It flew half-way across the room and struck a fellow-workman in his left eye. The man averred that his eye was blinded by the blow, although a careful examination failed to reveal an injury, there being not a scratch visible. He brought suit in the courts for compensation for the loss of half of his eyesight, and refused all offers of compromise. The day of the trial arrived, and in open court an eminent oculist, retained by the defense, examined the alleged injured member, and gave as his opinion that it was as good as the right eye, and proved it. And how do you suppose he did it? Why, simply by knowing that the colors green and red combined make black. He prepared a black card on which a few words were written with green ink. Then the plaintiff was ordered to put on a pair of spectacles with two different glasses, the one for the right eye being red and the one for the left eye consisting of ordinary glass. Then the card was handed him and he was ordered to read the writing on it. This he did without hesitation, and the cheat was at once exposed. The sound right eye, fitted with the red glass, was unable to distinguish the green writing on the black surface of the card, while the left eye, which he pretended was sightless, was the one with which the reading had to be done.

IMPROVED PACKING MATERIAL.—An already extensive use of "wood wool" is reported in France—a new article, consisting of extremely thin and slender savings of wood, that are comparable to paper cut for packing. It weighs about 40 to 50 per cent less than the materials generally used for such a purpose, and its beautiful appearance, fineness, and extreme cleanliness have brought it into great favor. It was also soon found to be well adapted for the manufacture of mattresses, for the filtration of liquids, stuffing horse-collars, etc., the most suitable species of wood being selected for each of these uses. Its elasticity causes it to be considered the best material for bedding, after horsehair, and is, in fact, preferable to any other substance when it is derived from resinous wood, since it does not then absorb moisture. In workshops wood wool is tending to replace cotton waste for cleaning machines, and it has likewise found an application on the rolling-stock of railways for lubricating car axles; while it has the same property that cotton waste has of absorbing oil, its cost is many times less than that material—these various advantages explaining why the use of it has become so extensive in so short a period.

"I Would That I Were Dead!"

Cries many a wretched housewife to-day, as weary and disheartened, she forces herself to perform her daily task. "It don't seem as if I could get through the day. This dreadful back-ache, these frightful dragging-down sensations will kill me! Is there no relief?" Yes, madam, there is. Dr. Pierce's "Favorite Prescription" is an unfailing remedy for the complaints to which your sex is liable. It will restore you to health again. Try it. All druggists.

Danger Ahead!

There is danger ahead for you if you neglect the warnings which nature is giving you of the approach of the fell-demon—consumption. Night-sweats, spitting of blood, loss of appetite—these symptoms have a terrible meaning. You can be cured if you do not wait until it is too late. Dr. Pierce's "Golden Medical Discovery," the greatest blood-purifier known, will restore your lost health. As a nutritive, it is far superior to cod-liver oil. All druggists.

* * * Delicate diseases of either sex, however induced, speedily and radically cured. Address, in confidence, World's Dispensary Medical Association, Buffalo, N. Y.

RAPID WORK.—Some idea of the extent to which mechanical ingenuity and efficiency have advanced may be had from the following statement: "It is now possible to construct a complete sewing machine in a minute, or 60 in one hour; a reaper every 15 minutes, or less; 300 watches in a day, complete in all their appointments. More important than this, even, is the fact that it is possible to construct a locomotive in a day. From the plans of the draftsman to the execution of them by the workmen, every wheel, lever, valve and rod may be constructed from the metal to the engine intact. Every rivet may be driven in the boiler, every tube in the tube-sheets, and, from the smokestack to the ashpan, a locomotive may be turned out in a working day, completely equipped, ready to do the work of 100 horses." Without such machinery and the skilled labor to operate them, the civilized world of to-day would be an impossibility.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

CANNED FRUITS.—The pack of canned fruits in California this year is expected to be 25 to 30 per cent more than in 1886.

EXTRAORDINARY OFFER!

This Valuable Book for 50 Cents!

To every one who subscribes to this paper, it contains 50,000 Separate and Distinct References; 1200 Engravings illustrating various topics. Accurate and concise information on Art, Science, Philosophy and Religion, including learned essays by the compiler, Prof. H. L. Williams and several hundred other authors. The articles on Anatomy, Architecture, Agriculture, Astronomy, and the Fine Arts, are full and explicit. Botany, Chemistry, Engineering, Geography, Geology and History, are each treated ably and explicitly. The article on Engineering is still further amplified by a full description, illustrated with plates and diagrams of the Great Brooklyn Bridge; Mechanics with plates illustrating Mechanical Motions. Mineralogy, Medicine, Law, Languages and Governments, are so clearly treated of, that every one who reads can understand. In addition to the full and complete Encyclopedia, arranged in alphabetical form, we have bound up in the volume, a Complete Library of Knowledge, including a Guide to Correct Speaking and Writing; Book keeping, a complete guide to business; Chronological History; Mythology; AN INDEX TO THE HOLY BIBLE; a complete brief Biographical Dictionary; full and complete statistical history of the United States, corrected down to 1884. The Interest, Banking, Usury, Insolvent and Homestead Laws of the United States, are for the first time gathered together in one volume. A LIST OF COUNTERFEIT NOTES WITH RULES FOR DETECTION OF COUNTERFEITS. Separate Dictionaries of Musical, Nautical, and Geographical terms; a carefully prepared treatise on Pronunciation giving rules and examples whereby every one can become his own teacher. AN APPENDIX OF THE ENGLISH DICTIONARY, giving hundreds of words not contained in the ordinary dictionary. FLAGS OF ALL NATIONS beautifully illustrated by colored plates. In fact the book is a library in itself. It has 800 pages, and is more profusely illustrated than any other Encyclopedia at the price, and contains a mine of information on almost every subject known to man. Every one of the many departments is worth more than the cost of the book. As "knowledge is power," this Encyclopedia will be a source of wealth to thousands in all ages and conditions in life. This handsome octavo volume is printed on good paper, and handsomely bound in cloth embellished with gold.

Without guaranteeing all that is said above by the Eastern publishers of the work, the proprietors of this paper consider the book a valuable one, and in the absence of a more costly publication) very desirable in most households, and worth several times the cost mentioned above. In fact, we will refund the cost, with postage added if any subscriber chooses to return the Encyclopedia to us within thirty days after receiving it. Address the publishers of this paper. While this notice appears, the WORLD'S CYCLOPEDIA will be sent to any subscriber (old or new) who orders it, and pays his subscription one year in advance and 50 cents additional.

OSTRICHES.

Having a few more of these valuable birds than I have room for on my farm, I will sell, at a very moderate price, three or four pairs. They were all chosen by me in Africa with great care, and are of the best stock.

These birds require little care and will do well in almost any part of California; two acres of ordinary grazing land will keep one pair through the year. The feathers—a seven-monthly crop—yield a large return on the outlay, and the number of chicks obtained from a pair averages from five to twenty a year.

Dewey & Co.'s Scientific Press Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports, files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

Dr. J. KERR—Dear Sir: I have analyzed your sample
of "Nitrogenous Superphosphate," with the
following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Pota-h.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85
per cent Ammonia, therefore, total of Nitrogen cal-
culated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vine-
yards, orchards, gardens, farms, and I recommend its
use by the cultivators of the soil generally, in Cali-
fornia. Yours truly,
DR. E. A. SCHNEIDER

University of California, College of Agri-
culture.

BERKELEY, Nov. 20, 1886.

Dr. J. KERR, San Francisco—Dear Sir: I take pleas-
ure in adding my testimony to that of Dr. Schneider as
to the high quality of the "Nitrogenous Super-
phosphate" Fertilizer, analyzed by him at your re-
quest. It is a high-grade article, and as such re-
turns the user a better money value than a low-grade

RICHARDSON.

Among a host of competitors, many of which are ex-
cellent Instruction Books,

Richardson's New Method for the
Pianoforte

Still serenely occupies the position of the "winning
yacht" in the race for popularity.

Its sale has been tremendous. Edition follows edition
in rapid succession, and it will not be long before it will
be safe to announce

A HALF MILLION COPIES

As the total number printed and sold.

"RICHARDSON" is a very correct book. For
a long time, no error in a phrase or note has been re-
corded.

"RICHARDSON" has become a standard favorite
with a multitude of teachers, who find an advantage in
giving lessons from a book with which they are familiar,
and that by its high reputation secures the respect and
interest of the scholar.

"RICHARDSON" has advantages in the way of
good illustrations of the position and action of the fin-
gers, and also in the few pages of advice to players from
the pens of Schumann and Czerny.

Mailed for the price, \$3.00.

OLIVER DITSON & CO., Boston.

C. H. DITSON & CO., - - 367 Broadway, New York.

HORSE POWERS, WINDMILLS, TANKS
and all kinds of Pumping Machinery built to order.
Awarded Diploma for Windmills at Me-
chanics' Fair, 1885. Windmills from \$65. Horse
Powers from \$50. F. W. KROGH & CO., 51
Beale Street, San Francisco.

fertilizer. It is especially well adapted to use in
California, on account of the predominance in
it of Phosphoric Acid, which is generally in small
supply in our soils. Yet it is desirable that "com-
plete" fertilizers be used in our orchards and vineyards,
and yours is of that character in furnishing
Potash and Nitrogen as well. Very respectfully,
E. W. HILGARD.

The value of this Fertilizer consists in the large per-
centage it contains of Phosphoric Acid—the chief
element of all plant food—in combination with the
necessary quantities of Potash and Ammonia, and
the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found
sufficient: For Wheat, Barley, Corn and Oats, 300 to 350
pounds per acre. For Gram, Sugar Beets and Vege-
tables, 250 to 300 pounds per acre. For Vines, Fruit
Trees, from 1 pound to 1 pound each. For Flower Gar-
dens, Lawns, House Plants, etc., a light top dressing,
applied at any time, will be found very beneficial.

HEADQUARTERS FOR ALL KINDS OF BALING PRESSES —AND— HAYING TOOLS.

THE MONARCH, JR., HAY PRESS.

IMPROVED FOR 1887.
Any young man can earn more on an investment of \$500 in this press than can be earned in expending \$2000 for any other machine. We have a Monarch Press, which we sell for \$600, but has been used a very little and is just as good as new, which we will sell for \$450.

THE CLIMAX HAY PRESS, \$300.

Weight, 2200 lbs. A crew of three men—four can be used to advantage. Five ropes are used on the bales. Capacity, 10 to 15 tons per day. The best press for the money in the world.

The Celebrated Petaluma Baling Press.
Weight, 2600 lbs. Price, \$350, delivered at the factory. Size of bale, 22x22x48 inches. Capacity, 26 tons per day. Weight of bale from 225 to 400 lbs. This remarkable machine still stands at the head of all vertical baling presses, and probably bales three-quarters of all the hay west of the Rocky Mountains.

Whitman's IMPROVED New Rebound Plunger.

GREATLY IMPROVED FOR 1887.

Do not confound our New Press with that made two years since. EVERY PRESS FULLY WARRANTED. For one or two horses. The most powerful in use. The most rapid and durable, and the most perfect. Makes the most perfect bale. The most simple to operate. Least expense for repairs. NO STOPS FOR TYING BALE.

The Greatest Success of the Age.

Victorious in every contest. Double-acting, with new concentrating power. Do not buy a Press until you have seen the Improved New Whitman with concentrating power. Puts from 10 to 15 Tons in a Car.
16x18 Mounted, weight, 3600 lbs. \$400 00
16x22 Mounted, weight, 3300 lbs. 450 00
All make bales of variable size.

Hay Forks, Hay Carriers, Harpoon Forks, and all kinds of Haying Tools in great variety. In baling your hay, use our Steel Baling Ties. Cheaper than Wire—Better than Rope.

TRUMAN, ISHAM & HOOKER,
421—427 Market Street, San Francisco.

The BUYERS' GUIDE is issued Sept. and March, each year. 32-312 pages, 8 1/2 x 11 1/2 inches, with over 3,500 illustrations—a whole Picture Gallery. GIVES Wholesale Prices direct to consumers on all goods for personal or family use. Tells how to order, and gives exact cost of everything you use, eat, drink, wear, or have fun with. These INVALUABLE BOOKS contain information gleaned from the markets of the world. We will mail a copy FREE to any address upon receipt of 10 cts. to defray expense of mailing. Let us hear from you. Respectfully,

MONTGOMERY WARD & CO
227 & 229 Wabash Avenue, Chicago, Ill

LIGHTNING WELL SINKING MACHINERY. The above Hay Presses range in capacity from 10 to 40 tons per day, and some of them make (according to size) either the common or the compressed bale. There is nothing in the United States approaching our Hurricane and Junior Monarch for speed or excellence of work. Send for large Illustrated Catalogue to

PRICE HAY PRESS CO. SAN LEANDRO, CAL.

Worth's Patent Combined Screw and Toggle Lever Wine and Cider Press.

First Premium awarded on Wine Press at Sonoma and Marin Agricultural Fair, Sonoma Agricultural Park Association, Santa Clara Valley Agricultural Society and Mechanics' Institute, S. F.

I desire to call the attention of wine and cider makers to my Improved Press. The following has a movement of 2 1/2 inches, the first revolution of the screw moves the follower 1 1/2 ins., the last revolution is but 1-16 of an inch, thereby the power increases in the same ratio as the resistance. The platform is 50 inches wide and 10 feet long; is run back and forth under the press on a railroad track.

Has two baskets, by which you can fill the second basket while the first one is under the press, thereby doing double the amount of work that can be done on any screw or lever press in the market that use only one basket, for this reason: While my press is working continuously the other kinds are doing nothing during the time they are emptying and filling their basket.
Printed Testimonials can be had on application of the following parties, who have bought my press: J. B. J. Portal, San Jose; Wm. Pfeiffer, Guberville; Joseph Walker, Windsor; Kate F. Warfield, Glen Ellen; Joseph Drummond, Glen Ellen; Isaac De Turk, Santa Rosa; John Hinkelman, Fulton; J. & F. Muller, Windsor; R. C. Stiller, Guberville; Lay Clark & Co., Santa Rosa; Vache Freres, Old San Bernardino; J. F. Crank, San Gabriel; James Finlayson, Healdsburg; P. & J. J. Gobbi, Healdsburg; Wm. Allen, San Gabriel; Wm. Metzger, Santa Rosa; J. Lawrence Watson, Glen Ellen; Walter Phillips, Santa Rosa; Geo. West, Stockton; Eli T. Sheppard, Glen Ellen; Rancho Wine Co., Rancho, Los Angeles Co.; Downing Fruit & Wine Co., Downey; J. L. Beard, Centerville; Wm. Palmatag, Hollister; A. Burnham & Son, Santa Rosa; Paul O. Burns Wine Co., San Jose; E. Emil Meyer, Santa Cruz Mountains, Wright P. O.; Marshall & Hill, Laguna Station; R. J. Northam, Anaheim.

Also manufacture Worth's Patent Hand and Power Grape Stemmers. W. H. WORTH, Petaluma Foundry and Machine Works, Petaluma, Sonoma Co., Cal.

MAGIC FRECKLE CURE

Promptly Eradicates Freckles, Tan, Sunburn, Moth Patches and all discolorations without injury, and imparts to the skin purity and velvety softness.
—MAGIC—
COMPLEXION SOAP
Removes Pimples, Fleish Worms, Blackheads and cures Oily Skin. Either of the above articles sent post-paid for 25 cts. each, or 6 packages for \$1. Be sure and mention this paper. The W. Millard Co., Buffalo, N. Y.

Fruit Engravings, The finest, best and cheap. Photographs and Engravings, etc. Engravings of Fruits, Vegetables, Houses, Farms, Landscapes, etc., made by S. F. PHOTOGRAPHING CO., 659 Clay St., S. F.

NEVER AHEAD! THE RAMSHACKLE WINDMILL!

These mills will be offered to the public AFTER THEY ARE MADE.

SO DON'T

Buy any CHEAP MILL, till you see a RAMSHACKLE.

These mills will be offered at following prices:

Full-Grown Mill,	\$34.35
Half-Grown Mill,	34.35
Baby Mill,	34.35

All the same price, because equally (no) good.

Mills Complete,	\$34.35
Mills Without Wheel,	34.35
Mills Without Vane,	34.35
Mills Without Crank,	34.35

Because equally worthless WITH as without the parts.

EASIER to take care of and SAFER in a storm, without the wheel.

PHOTOGRAPHS OF THE RAMSHACKLE, - \$34.35

These Photographs will be hung in a modern gallery and neatly painted, and will be quite an ornament to the parlor table. Furthermore, they will do as much work there as the Ramshackle in the field, and therefore price is the same.

BUT IF YOU WANT

The best and most powerful mill in the world, at a fair price, buy the "CYCLONE," owned and built at their works in Santa Clara by the

PACIFIC MANUFACTURING CO.,

934 and 936 MISSION STREET, SAN FRANCISCO, CAL.

ALWAYS AHEAD!

\$35. Golden State \$35. WINDMILL.

\$35.00 CASH.

Has stood the severest tests of practical use for many years. It is STURDY, DURABLE, SELF-REGULATING, STORM-DEFYING. Requires less wind than any other Mill, and embraces all the latest improvements. It has the shortest shaft and is the best balanced Mill ever made. The frame, or rims, of the wheel are bent, material used in their construction being the best. There is no simpler or more perfect self-regulator made.

Runs in the Lightest Wind.

Defies the Fiercest Storm.

Never Blows Down.

Always in Order and Ready for Use.

Any Farmer Can Repair it.

You Will be Delighted.

It is low in Price—only \$35 Cash.

You buy your Mill from the manufacturer.

Should a farmer be without a Windmill when he is able to procure one of our Golden State Mills for \$35 cash? You will save the cost of Mill in six months. Call and see our mill that costs but \$35 cash, or send for circular.

Send for our Special No. 14 Catalogue. We carry the most complete line of

Windmill Force Pumps and Pumps for Every Purpose, Tanks.

Change the Patent Laws.

It is certainly true that our patent laws work sometimes exceeding hardship to honest and innocent users of fraudulently sold infringements on patented articles. It is a wonder that the evils have not ere now been so urgently complained of, not only by farmers but by many other industrial users in the United States, that our Congressmen should have heard their demands and given them relief by a change of enactments on this subject. While many serious abuses have no doubt occurred in the administration of the patent office for years, the main difficulty and overshadowing evils borne by our people come from the fault of the patent laws rather than from our general patent system. Faulty as it is, the United States patent system will compare favorably with the systems of older nations which our own superseded.

No time should be lost by Congress in so changing our patent laws that innocent users of patented devices should be protected from the annoyance and expense they are now being subjected to through the owners of patents, who in too many cases look mainly to the profits, regardless of justice, in their motives and actions for infringement. It is their policy to wait until the country is flooded with articles made in violation of their patents, and then make an onslaught on farmers and others using them. This course, unfortunately, the law allows them to adopt. Instead of this, they should be required to bring action within a reasonable limit of time against any manufacturer who violates their patents, and no user should be required to pay damages for articles bought in good faith.

Another change which should be made in our patent laws should provide for forfeiture of all patents that are not worked within a reasonable length of time after the patents are obtained. As it is now, many patents are taken out and remain dormant until they are found to interfere with inventions of a later date, and when such are made manifest, they stand, like a "dog in the manger," in the way of the later and better inventions. Congressmen throughout the entire United States should be petitioned and urged to have the United States patent laws revised and greatly improved through the appointment of a commission or otherwise.

If patentees were required to work their inventions practically before the public within

two years from date of their patents, or pay \$5 a year thereafter to the Government, at least two-thirds of the patents would be thus canceled and placed out of power to hinder others or do others mischief.

CHERIMOYER.—We kept the cherimoyer which was sent us by Joseph Sexton of Goleta, Santa Barbara county, until it was well ripened, and then attacked it with spoons and other implements of gastronomic warfare. The result was very satisfactory; the flavor was delicious and cannot be better described than by the term custard-apple, which is the English name

Forestry Congress.

The secretary of the State Horticultural Society has received from George W. Minier, president of the American Forestry Congress, a communication setting forth the fact that the sixth annual session of the congress will be held this year in Springfield, Ill., on the 14th, 15th and 16th days of September. At the last session of the Illinois Legislature a resolution was adopted by a unanimous vote cordially inviting said association to hold its next annual session at the capital of that State.

The circular sent out by President Minier

An Important Texan City.

The opening of the Sunset route is ministering to the growth and development of the country along our southern border and increases our interest in the region with which we have been brought into close connection in point of time. All along the line eastward California's influence is being felt and California's achievements are being emulated, wherever local conditions are favorable. Plants, trees and vines are sent eastward in considerable quantities, and barring some failures because of ill adaptation of the country, there will be a vast advance in the

horticultural interests of the southwest territory.

The engraving on this page, reproduced from Major Truman's pamphlet, shows the town of El Paso, situated on the line of the Southern Pacific railroad, at a point 800 miles easterly from Los Angeles, and 1283 miles southeasterly from the city of San Francisco. It occupies a handsome site on the banks of the Rio Grande, and, although located in Texas, is only eight miles from the Territory of New Mexico on the west, being separated from Old Mexico on the south by only the breadth of the

VIEW OF THE CITY OF EL PASO, ON THE RIO GRANDE, TEXAS.

for the fruit. It has all the richness of a well-made custard, and its sweetness is enlivened by a delicate tartness, characteristic of the best eating apples. The fruit was pear-shaped, about four inches in diameter, and when ripe was of a dark-brown color. The specimen contained about 80 seeds, most of which we returned to Mr. Sexton. For situations where the cherimoyer thrives, we should think it could be commended for planting—on a small scale, of course, at first, to test our markets for it.

GAS TREATMENT FOR SCALES.—We were misled by the Los Angeles *Herald* in crediting to Mr. Coquillett a statement concerning the use of hydrocyanic gas which emanated from Mr. Morse, and was published by him in a University bulletin recently. Mr. Coquillett has written a note to a subsequent issue of the Los Angeles *Herald* stating that the computation for length of treatment, etc., was not his but Mr. Morse's. The method devised by Messrs. Craw and Coquillett, some months ago, was to generate the gas inside the tent. Mr. Morse's plan is to generate it outside and diffuse and distribute it inside the tent by forcing it in with a pump.

concludes as follows: "As the conservation of our forests, as well as the reforestation of many parts of our country, are matters of deep interest to our common country, we hope your society will commission a delegate interested in this subject to attend our session."

This matter will come before the next meeting of the Horticultural Society, which will be held at 220 Sutter street on Friday, August 26. It is to be hoped that a member can be found who can be at the East at the date named. There is of course much interest taken in forestry by our fruit-growers, and they would like to be represented at the meeting of the congress. It is understood that one of the California Board of Forestry Commissioners will be present.

FENCE LAW OBSERVED.—The Secretary of the Interior is informed that the law of Feb. 25, 1885, to prevent the maintenance of illegal fences on public lands, has been generally complied with throughout the West, especially in Arizona and New Mexico.

A WINERY with a capacity of 100,000 gallons is being put up at Mountain View by the Jesuit fathers, and one half as large by Capt. Selinger at the same place.

river, here 250 yards wide. El Paso contains 3000 inhabitants, and is an active, rapidly growing place, contrasting strongly in this as in every other respect with the old Mexican town of Paso del Norte, standing on the opposite side of the Rio Grande. Indeed, the two places fairly represent all that is most noticeable in the ancient and modern civilizations—all that is most opposite in the wide-awake, go-ahead American and the dilatory, non-progressive Mexican. The history of the one covers nearly three centuries; of the other, hardly more than half a score years. On the north side of the river everything is new, many of the buildings being of large dimensions, stately and handsome, while all wear a substantial and comfortable air; on the south side are seen only the old mud-built structures, low and dingy, many of them with only barred windows, and scarcely any more than one story high, the signs of decay being impressed on everything, the people and the town alike.

The two places are connected by a tramway, over which the Mexican Central railway passes to the new city, its northern terminus. This tramway serves as a bridge, rendering communication easy between the two towns; too easy, for it leads to quarrelsome smuggling.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

From Saticoy to San Buenaventura.

EDITORS PRESS:—At the lower end of the Santa Paula country the mountains on the south side of the Santa Clara Valley of the South suddenly terminate, and that portion of the country lying south of the Santa Clara river spreads out into the great Saticoy plains and is considered as a part of the valley. We will in this communication have reference only to that section of the valley on the north side of the river between the Santa Paula country and San Buenaventura.

The village of Saticoy is only a small place situated on the S. P. R. R. coast extension, now well surrounded by thriving farm establishments, including many comfortable homes with handsome orchards, gardens and fields of thriftily growing crops. The foothills bounding the northern side of the valley from this point westwardly, rise into a low range of mountains, while still further back—miles away to the north—are seen the bold, dark summits of the mountains beyond the Ojai.

There is a beautiful legend connected with the origin of the name of Saticoy. Some springs are situated in the vicinity, and the legend recites that, in the olden time, the Indians came here in search of the waters of these springs, they having once been known, but now lost. When the springs were again discovered, the Indian first seeing them exclaimed in his native dialect, "Sat-i-coy!" ("Here they are!") or, as some translators have it, "I have found them." Thus, in the naming of the little village and the plains extending southwardly, the origin of the name is celebrated, and the glad-some exclamation of the Indian preserved as one of the few interesting incidents known to the present generation of the every-day history of a race now fast fading from the face of the earth.

The section herein contemplated is from 2½ to 3½ miles wide, has an undulating surface with a considerable inclination extending from the foothills to the river, and a soil much the same as that we find in the section next above and described in a former letter.

Field Crops.

As we descend the valley, the denser ocean fogs, and the winds which blow more or less, almost constantly, vary the climatic conditions, and while most of the products remain much the same, and fruits do well in many places, yet we find a larger proportion planted to beans and corn, and less to fruit; and especially do the citrus fruits almost entirely disappear. The bean is by far the most important field crop of this section and is planted extensively. Corn is, with some, a standard crop, and when the ground is well prepared before planting and the growing crop properly cultivated early in the season, the moisture retained in the soil and that furnished by the constantly recurring fogs is sufficient to produce corn of good size and of first-rate quality.

Orchard Fruits.

Of orchard trees that succeed well, the English walnut is considered by far the most important. Many are planting out orchards of this, generally setting the trees about 40 feet apart, filling up the ground between trees with lesser growth for temporary use, so as to realize from crops of quicker growth and earlier maturity, while the walnuts are making the necessary preparation for greater growth and longer life of usefulness in the years to come.

Next to the walnut in importance is the apricot, because of its vigorous growth and constant bearing. These two trees—the walnut and the apricot—seem to do well even near the coast without protection. While many other trees grow and produce, yet most of them thus near the coast do far better if protected by belts of evergreen; the Monterey cypress preferred because of its very thickly set branches and leaves.

The Best Varieties.

A. Everett, five miles southeast of San Buenaventura, nearly the same from the seashore, and a half-mile north of the Santa Clara river, has 60 acres in orchard. Of apricots he has the Royal, Large Early, and one locally known as Finney, which favors the Blenheim, and which he thinks may prove to be that famous variety. Some nurserymen have called it the Blenheim. It also resembles the Moorpark. It is later than the Royal. This tree has only fruited now the third year. Last year the apricot was a failure. This fact Mr. E. thinks is due to the alternate warm and cold spells of the winter preceding. Before 1886 his older apricots had for several years borne constantly. It is generally thought that the apricot raised in this valley fully maintains the high standard of California-grown apricots, and for canning purposes, sells for best prices obtainable.

Of apples that do especially well, Mr. E. names the White Winter pearmain, Newtown pippin, Fall pippin, and one here called the White astrachan, described as large, about 22 inches in circumference; flesh white, quite acid; ripens with the Fall pippin. As others which do fairly he mentions the R. I. greening and both the Yellow and White bellflowers. Of pears, most varieties succeed well. As in almost every place visited by us, the Bartlett,

owing to its good size and marketable qualities, is the favorite pear.

Peaches generally thrive and bear fairly to well, and are but little troubled with the curl leaf, as far as observation extends. Nectarines maintain a good growth and fruit well. Of prunes, the Petite (French) for drying does the best. It would seem, from observation in most places, that the people of this valley have necessarily to do without the luxury of cherries grown upon their own lands; but Mr. E. has one variety succeeding well, name unknown, large (1½ inches diameter), acid. It would be interesting to know the name of this variety, and, as it is doing well at this place, the fact may be suggested of its trial in many other places in the valley, and, if successful, might, in part at least, furnish a want which is almost universal throughout this portion of country.

Although a variety of the gooseberry, not yet cultivated, grows and bears well in its wild state, yet the domesticated varieties of both the gooseberry and currant, wherever tried thus far, are almost or quite complete failures. The fine jelly obtainable from the wild gooseberry might well justify its propagation to a limited extent, even if it should be found to have no other usefulness. In very many places the blackberry and raspberry repay the expenditure of cultivation.

In the higher portions of the valley, near the foothills, and a few miles away from the seashore, grapes fruit well and are pronounced of good character; otherwise are considered quite inferior.

Mr. E. has about 30 acres English walnut, one year old from seed, 50x50 feet. Apricots and prunes occupy the intermediate spaces 25x25 feet, thus making the whole orchard 25x25 feet. As the walnuts advance in size sufficient to occupy the whole ground, he expects to remove the smaller trees thus temporarily mixed in.

Ten acres of various kinds and varieties of fruit and nut-bearing trees, much older and now in bearing several years, show such good success that he has been encouraged to plant out a greater variety than most others in this section have attempted.

A. Bristol, in the same neighborhood, has 800 apple trees bearing every year. R. I. greening, White Winter pearmain and Newtown pippin, for value, stand at the head of the list. All his varieties bear well excepting Rome Beauty and Northern Spy. Has about 30 varieties of the pear. Two Flemish Beauties, ages 19 and 18, have borne full crops every year since they were old enough to commence. Crops are raised here, as they are generally throughout this section, without irrigation.

On land adjoining Mr. B., owned by Mr. Evans, has been raised on 50 acres an average of 2250 pounds flaxseed per acre.

Mr. B. says that it is ascertained all over this part of the valley, from well-digging, that the soil will average 60 feet in depth. There is no hardpan in this section and root crops and other plants run down to moisture.

Along the Telegraph Road

We see many very handsome residences, with orchards showing vigorous growth of trees, generally fruiting when old enough, and looking clean and well attended to. The well-cultivated lands, covered with the strong, healthy growth of beans and corn, exhibit a thrift that bespeaks for the owners an ample recompense for well-directed industry.

We would especially mention such places as those of Wm. Sexton, B. W. Dudley and E. E. Dunning. We regret that we were unable to find Mr. Sexton at home, so that we might have taken special notes from his handsome and well-established place. Mr. Dudley has shown the capabilities of the valley in raising considerable quantities of corn having all the characteristics of a superior production.

Mr. Dunning's young orchard trees are looking remarkably well from effects of good growth, close attention to pruning and proper tilth. We had the satisfaction of being shown some notably fine roses, the products of Mrs. Dunning's good taste in the selection of varieties, some of which are rather rare. In this valley roses grow and bloom to perfection, and there can scarcely be anything in plant life more satisfying to refined taste than the sight of their large, softly tinted and elegantly developed flowers and a sense of their delicious fragrance.

We here have a magnificent view of the "deep blue waters" of the Santa Barbara channel and beyond this picturesque "islands of the sea" that rise from the placid bosom of the great Pacific. We are able to watch the commercial ocean steamers, that, in plying their way up and down the coast, through the wide channel, unlike T. Buchanan Read's ships, alternating between extremes of sun and snow,

"These in their happy passage go
From lands of sun to lands of snow."

San Buenaventura

Is the county seat of Ventura county, situated at the extreme western limits of this section, extending from the lowest spur of the long line of hills bordering this section on its northern side to the sea-shore, its western limits reaching to the banks of the Buenaventura river. It is said to contain a population of 2500, and, under the impetus given it by the recent finishing of the S. P. R. R. extension to and beyond this point, is rapidly improving. It commands a large inland trade, and bids fair to become a city of considerable importance.

The place has three newspaper establishments—the *Free Press*, daily and weekly, published

and edited by that able writer and genial gentleman, Dr. Stephen Bowers; the *Ventura Democrat*, by J. McGonigle; and the *Ventura Republican*. We notice a Free Public Library, but at the time of our visit were unable to see the librarian. We learn that the library has some 3000 volumes. It is kept in a substantial building owned by the city.

Besides extensive warehouses, there are, worthy of note, two large fruit-drying and packing establishments. Considerable shipping has been done from this point, taking away great quantities of beans, grain, fruit, hogs and other products of the farm; also petroleum, which has been handled largely by the Mission Transfer Co. We find here a goodly number of public-spirited citizens who seem to take pride in their town and county, and who, by their energy and perseverance in this direction, give assurances of making their place still more attractive. The fine large schoolhouse, showing conspicuously on an eminence above town, evinces a love of culture not behind the general high-toned spirit of Californians, in the matter of furnishing, both childhood and youth, ample facilities for education. McD.

Ventura Co.

THE FIELD.

Propositions Concerning Alkali Lands.

EDITORS PRESS:—There are large areas of land in this State that farmers have hitherto fought shy of for the only reason that they were more or less afflicted with alkali. This substance to the average farmer has been, and is, a great bugbear, the writer thinks with but little reason.

He freely acknowledges that land of equal quality, without alkali, is more desirable. But the question is, whether, taking everything into consideration, there any land in the State more desirable than these dreaded alkali lands. He thinks not, and places before your readers his reasons for such an opinion.

He considers that there is more to be dreaded in imagination than in reality. It is true that there are lands so badly afflicted with alkali, and that of a decidedly injurious character, that to redeem them the application of a neutralizing chemical substance would be required to render them suitable for cultivation, and the expense of this would, from inaccessibility or other reasons, be greater than the cost of available good land that would require none of this extraneous expense. Land of this character can be left for the coming generations to conquer when other lands have reached a high value.

It is now, however, a well-determined fact that the great bulk of alkali lands in this State have not such a large proportion of these salts as will prevent the germination and growth of most of the desirable crops, whether grain, vegetables, grasses, fruits or vines, always provided that the alkali remains

Equally Distributed Throughout the Soil.

This is the solution of the difficulty, and it is at this point that most of the failures originate. The reason is obvious. The alkali usually encountered is only injurious when present in large quantities and in concentrated form. Alkali is readily soluble in water. Now, what would be the natural effect of a heavy rainfall or of an abundant supply of water applied to the soil by irrigation? Inevitably a solution of alkali to the extent of the amount of water applied, further governed by the distance to which it has penetrated the soil.

It is evident that no sooner does the application of water cease than evaporation begins, and proceeds with more or less rapidity according to the state of the atmosphere, as it may be more or less charged with humidity, or of a temperature ranging from hot to cold. In any case evaporation begins and continues. It goes without saying that this can occur at and from the surface of the ground only. As the water evaporates, a continuous supply of alkali in solution is brought to the surface by the capillary attraction of the soil. The water passes off into vapor, but the alkali salt cannot and remains behind at and on the surface. It is, of course, obvious that during this process of evaporation the solution of alkali at the surface is becoming more and more concentrated, until it is finally left as the pure caustic salt itself. We now ask, "What is the most delicate part of all plants?" Unquestionably the crown of the roots, where the stem or leaves of the plant begin. This being at or near the surface of the soil, where also is the concentrated alkaline solution, the result can be readily imagined. It is not surprising that the vitality of the plant is affected, if not totally destroyed. Now, what is the clear deduction to be drawn from our premises? Simply, that if possible, this concentrated solution of alkali must be prevented from coming to the surface, or rather, that a concentrated solution must be prevented from forming at all.

We now have these three propositions determined. First, that the alkali in concentrated form is injurious. Next, that if equally distributed throughout the soil it is not injurious. And finally, if we can prevent the first we can cultivate our alkali soil to advantage and profit; for it must be borne in mind that, with rare exceptions, these soils have the most valuable in-

redients of plant life in the greatest abundance, and in this respect are especially desirable.

To Prevent Concentration.

It now remains only to demonstrate whether we can, at slight expense, keep the alkali where it should be, distributed in equal proportions through the soil, and prevent it from reaching the surface in deleterious proportions.

Really there is nothing easier.

In preparing the soil for fruit trees or vines, or for any crop, the plow performs the first function in this important business by turning under and placing where it belongs whatever of the alkali may be at the surface at the time, and subsequent irrigation, properly done, or the next rainfall, will perform its part by making the distribution in the soil one of equal proportions throughout.

I now propose to confine myself to the consideration of lands that are habitually irrigated by artificial means. The proper deductions can be easily drawn from them as to the correct handling of the lands that depend for moisture upon the rainfall alone.

Let us start at the point where, in the case of fruit trees or vines, the land has been properly cultivated, the plants set out and irrigation about to commence. The first lesson we have learnt is, that in no case is the irrigation to be done by flooding the land, for that is what does all the mischief. The land has been placed in a fine condition of tilth, is deeply plowed and subsoiled and harrowed till it is as fine as it can be got. The deeper the plowing the better, for we then get our water where it is wanted, viz.: as deep into the ground as possible.

It is already said that we must not allow the water used in irrigation to flow over the surface of the soil. This is not only to prevent baking of the ground, but also to prevent as much as possible evaporation. (Every farmer knows that when any soil is in a condition of fine tilth the evaporation is reduced to a minimum.) We thus keep the alkali where it should be, underneath the surface and distributed through the soil. It is true that to a slight extent the tendency even then is for the alkali to concentrate near but not at the surface. This is of course cured by the cultivation which is invariably required in the successful growing of fruit or grapes.

To Properly Irrigate

Our orchard, or vineyard, therefore, we must do it in ditches and by seepage. The more porous and absorbent the soil the fewer ditches will be needed, as they can be placed well apart, or away from the trees or vines. With soil that does not readily seep or leach, the ditches must obviously be run closer to the plants. There is, however, no soil, be it ever so clayey, that will not seep at least three feet, provided the plowing and cultivation has been deep and thorough. The advisability or necessity of this deep and thorough cultivation with new and wild ground, and the necessity of summer-fallow to such, is too well known and acknowledged to require argument. It is an absolute requirement for future success; and with the soil so treated it is evident that a clean ditch that has had the subsoil plow run through its length will place the water deep in the ground, where it is important that it should go.

Growing Grasses and Alfalfa.

For forage crops, such as alfalfa, the treatment at first should be identical with that for fruit trees, except that we must form our field into beds by turning the furrows back on each other until a bed is formed similar to one for the growing of vegetables. (Each bed formed in this manner has, of course, a ditch on each of its sides.) This is, of course, more trouble than ordinary plowing for grain or grasses, but it is done but once, and for the proper working of alkali lands is absolutely necessary. The width of these beds is regulated by the seepage qualities of the soil, being from say four or six to 12 feet wide; the length to be governed by the slope of the ground, convenience or other circumstances. As this work can be done but once and for all time, remember that it must be most thoroughly done. The ground should be plowed in the spring or early summer, if possible a foot deep, and subsoiled for another foot. The ditches should also be subsoiled to an equal depth. The rough plowed soil having received its life from the light and heat of the summer sun, it should in the fall be well and carefully harrowed to prepare it for the seed. Supposing this to be alfalfa, it is sown about 10 pounds to the acre and lightly covered with a brush-harrow, or even left on the surface uncovered. Better this than getting it too deep in the ground. Now just before or at the time of the first rain is the time to first irrigate, which is done by running the water through the ditches in sufficient quantity to thoroughly saturate the soil. We reiterate, this water must on no account be permitted to flow over the surface of the prepared beds. The falling rain sinking gently into the ground meets the moisture we have placed there by irrigating, and the saturation is complete. The seeds germinate and grow and there is a supply of moisture to carry the plants along, though the next rains should keep off for many weeks; and during the prevailing rainy season no artificial irrigation will be required, even in districts where the rainfall is so light as in the southern part of the San Joaquin valley. During this portion of the year evaporation is so slight as hardly to be noticeable. The soil is open and porous, and the roots of the alfalfa have no difficulty in striking down to a good depth.

Now spring has arrived, the rains have ceased,

the air is becoming dry and warm, and evaporation begins to be great. Our alfalfa has made a good stand and covers the ground well, with its roots deep in the soil. More moisture is, however, needed, and we supply it by irrigating as before, through the ditches, still not allowing it to flow over the surface. In heavy soils, where the earth in the ditches has baked, so as to interfere with the seepage, it may be necessary before we turn the water on to again run the subsoil plow through them to break up the crust, and allow the water to go where it should go, as deep down as possible. It will be seen that having kept the water all this time off the surface of the ground we have prevented not only baking of the soil, but have prevented the alkali solution from concentrating at the top. Hereafter the evaporation from the surface is prevented by the growth of the alfalfa which shades it, and all future evaporation must take place through the leaves of the plants, and again we prevent the formation of a concentrated solution of the injurious salts.

This system of irrigation can be continued indefinitely, or in many cases the growth will have become so strong and vigorous that the plant will be beyond the danger of injury, and the land can be irrigated by flooding. In such case, of course, checks must be built, while in the former case checks can as a rule be dispensed with, as the water will do its work while running through the ditches. Stops can be set in the ditches at intervals if necessary. Each case must be governed by its surrounding circumstances.

It can be readily seen that there will be no difficulty in the free use of the mower and rake.

As to sowing alfalfa in the fall before the frosts, it is now settled beyond question that that is the best time for the purpose, as it requires a very low degree of temperature to injure the plant after it has gained its third leaf. The very decided advantage of the plant having the cool or cold weather in which to make its roots before the top growth is stimulated by the warmth of a later season is beyond computation, as this is the critical point of its life and welfare.

Taking everything into consideration, then, first that these soils are rich and will last for generations; next, that with but little extra trouble they can be successfully cultivated; and last, but by no means least, that they can be purchased at nominal figures, we again ask: Are there any lands in the State more desirable of possession, on the basis of a revenue-yielding value?

Proof of our statements is all that is needed to bring thousands of these shunned acres into cultivation and on to the market. Experiment only will furnish the proof or disproof. Try the experiment, unhappy owners of the "Bad Lands." Put all your strength, will and brains into a few acres, and many of you will find happiness and wealth where you now least look for it.

RECLAIMER.

San Francisco.

[Some of these propositions will, no doubt, call out discussion. The subject is of great importance, and full discussion will be of general value.—EDS. PRESS.]

HORTICULTURE.

Meeting of the State Horticultural Society.

The regular July meeting was held on the 29th in this city, Vice-President Hatch in the chair. S. L. Goldman of San Francisco and W. A. Fisher of Napa were elected members, and a number proposed for election at the next meeting.

Fruit Exhibits.

The exhibits of fruits were unusually large. There was a display of apricots from the experimental orchard of the University at Berkeley, among them being the Early orange, Turkey, Red Masculine, Beauge, Early Moorpark, Blenheim, St. Ambrose, Kaisha, Royal, Auberge de Montgamet and Early Golden.

W. H. Pepper exhibited several varieties of apricots, with cleaned pits of each, and at the request of the society gave his observation on the specific differences in the pits. We hope he will write out his observations on this point for publication in the RURAL.

James Shinn showed the Peen-to or flat peach of China, which he esteems for some of its characteristics.

A. D. Pryal showed his new apricot obtained by crossing the Royal and Blenheim, as described in last week's RURAL.

Mr. Klee showed the "Tragedy Prune," as grown to some extent along the Sacramento river. It is said to be a seedling of the *Petite* prune, and claimed to be exempt from San Jose scale. The tree is much like the *Petite*, except that the shoots are downy. Mr. Hatch said the variety came in in time to ship well this year.

Mr. Hatch exhibited a large yellow peach, grown in Santa Clara county, to which he desired those present to give a name. He caused considerable surprise by explaining that it was a specimen of Early Crawford, though considerably larger than Crawfords generally grow. He thought a region which could produce such Crawfords must be adapted to peach-growing.

R. J. Trumbull exhibited a branch holding fine peaches.

The secretary showed the King orange grown

by J. E. Cutter of Riverside which was recently noticed in the RURAL.

Report of Apricot Committee.

Gilbert Tompkins made a report for the committee appointed especially to investigate an apricot raised by R. J. Trumbull, as follows:

State Horticultural Society—GENTLEMEN: Your committee appointed to investigate an apricot raised by Mr. Trumbull has received the following letters from apricot-growers in different parts of the State:

E. J. Wickson, Esq.—DEAR SIR: I notice by report of last meeting of the Horticultural Society that you are on a committee to report on a large, very early apricot, exhibited by Mr. Trumbull at the previous meeting. I fruited a large early apricot this season that may throw some light upon the subject. I procured it from I. H. Thomas of Visalia, under the name of Eureka. He claimed that it was a new variety. Following is his description taken from his catalogue for 1883-4: "The Eureka—This is the earliest large apricot in the State, fully as large as the Moorpark, and four weeks earlier." It was the first to ripen with me this season (I have not the Pringle in my collection) of large size and good quality. This variety may have found its way to San Rafael; if so, the tree could not be over four or five years old.

The apricot from San Rafael, however, may be some old variety, Moorpark or Hems Kirk. There are so many circumstances that may change the time of ripening of a particular variety, or of a particular tree of the same variety, that it is not safe to give this a new name until we learn its history. My Moorpark this year ripened with the Royal, one tree at least a week before.

We are now using many more names on this coast than we have varieties of fruits; for instance, the Early York peach has been called Myer's Early and Strawberry peach. Royal Ann for the Napoleon cherry, Hungarian Prune and Grosse prune for Pond's seedling plum, and many others that I might name. I am in favor of correcting our nomenclature on this coast so as to conform to that of standard American authors.—W. H. PEPPER, *Petaluma*.

G. W. Thissell of Winters, from his examination of samples sent him, writes as follows:

If the tree is a good grower and bears well, if the fruit ripens between the Pringle and Royal, and has any color before it gets soft so it would be a good shipper. I think it would be a valuable apricot—but it should have all of these qualities to make it more desirable than the Royal apricot as a shipper.

As a canning apricot I cannot judge, but from my test of the sample you sent, as a drying apricot, I would pronounce it A No. 1. There is nothing against it but the color, and that is very fair.—G. W. THISSELL, *Winters, Cal.*

Mr. Gilbert Tompkins, *San Leandro, Cal.*—DEAR SIR: I received yesterday two apricots by mail from Mr. R. J. Trumbull, with instructions to give you my opinion of them. It is this. They are a smooth, regularly formed apricot of very fine color, are remarkably dry and mealy, therefore will make an unusual large yield of dried fruit to the pound of ripe fruit, and will, I think, make remarkable fine colored dried fruit. As to their qualities for canning, I cannot say, not knowing whether the mealy character of them would be objectionable or not. At any rate, such dried product as they would produce would be as profitable a way to use them as to can, if there is no objection to their meanness. I think them an excellent fruit, and worthy of large planting.—A. T. HATCH, *Suisun*.

Mr. Gilbert Tompkins, *San Leandro*—DEAR SIR: Mr. R. J. Trumbull of S. F. has sent me samples of apricots represented as coming in immediately after "Pringle," requesting that I give you my opinion of same. The sample was received in good order, and sufficiently ripe for eating. In size is somewhat larger than the average "Royal," color, good; texture, firm and somewhat dry; flavor no better, if hardly as good as Royal; quite uniformly ripe on all sides, which is very desirable for either eating or shipping. If the tree is healthy and a good bearer of fruit corresponding with sample, it must be valuable.—P. W. BUTLER, *Penryn*.

Mr. Code canned two cans of the apricot and thinks very highly of it. The committee refrains from opinion as to the determination of the variety, thinking it needs further observation.

GILBERT TOMPKINS (for the committee).

The report of the committee was received and placed on file. Mr. Shinn remarked that there was room for a new apricot which should unite the good qualities and correct the defects in the varieties we now have. He was disposed to think very well of the Blenheim.

Salt or Sulphur.

Mr. Coates showed two dried apricots, one of which had been immersed in weak brine before drying, as suggested by Prof. Hilgard. The other apricot was put upon the drier without treatment. The fruit which had been dipped in salt water was of a fine fruity color and translucent, and the other was brown and much less marketable. He had used one ounce of salt to six gallons of water, left the fruit in this brine five minutes and then placed on the Common-sense drier and evaporated it in 2½ hours. [The salt solution which is commended for trial by Prof. Hilgard has one-quarter of one per cent of salt. This would be about one ounce to three gallons, or about twice as strong as Mr. Coates used. However, if the weaker dose will do the work it is all the better. Systematic experiments will, no doubt, be made on this point at the University, and similar experiments should attract the attention of growers.—EDS. PRESS.]

Sulphuring of apricots was discussed to some extent by several speakers. Mr. Holt of Riverside thought the use of sulphur before the fruit was put to dry should not be called bleaching, but rather fixing the color. Several said they could not detect by the taste any difference in acidity of properly sulphured

fruit and that not sulphured. [It should be noted that it is loss of fruity flavor, as well as development of sulphuric acid, which Prof. Hilgard has claimed to be an ill effect of sulphuring.—EDS. PRESS.]

The Peach.

The subject appointed for debate for the meeting, "The Peach—Its Culture and Marketing," was then taken up, and the following essay read by Mr. Tompkins:

"The peach does best on its own stock in a light, rich, warm soil, and in a warm climate, moderately free from winds. At time of planting, the tree should not be more than a year old. Some prefer to plant trees in the dormant bud; others to plant seedlings where the trees are to be, and to bud to the varieties wanted in the following year. Authorities differ as usual.

"In fruit-growing, as in all other work, everything depends on putting the right thing in the right place. Don't try to raise any kind or variety of fruit that some one else can raise twice as well with the same amount of work. Don't try to raise peaches for market unless your locality, soil and climate will produce healthy trees, good fruit and plenty of it. If the fruit has not been tried near you, try it yourself in a small way. Enough men have been kept poor by planting large orchards that never could pay except in the mind of the planter. Don't add yourself to the number.

"All this applies not only to the different kinds of fruit, but also to the varieties of each kind. Take the Roseville Cling; it is a success at Suisun and a failure at San Lorenzo, where it curls badly.

"As a general rule, the warm interior valleys—Vacaville, Winters, Suisun, Sacramento, Marysville, Fresno, Tulare, among others—will produce peaches profitably. The coast and bay counties will not. While there are many exceptions, this will do to tie to as a general proposition.

"There are an enormous number of varieties, many of which are useless. Plant varieties that have a solid commercial value, either for shipping, canning or drying. Combine all the good qualities you can and see that the chosen varieties do not ripen all at once. Consult your neighbors who are successful in the business and the nearest reliable nurserymen. Do not get rattled if they all give different opinions, but put your judgment to sifting evidence, and see who ship the best fruit and the most of it. Go slow, but do not be a clam. Energy is as necessary as caution; nevertheless, misdirected energy sometimes becomes recklessness."

Discussion.

James Shinn spoke very strongly in favor of the peach in general as a profitable fruit to grow, and thought the essayist had pronounced a little too strongly against the peach in the coast valleys. Admitting that the interior grows the very best, it is not wise therefore for these places nearer the coast, which grow a good peach and do it profitably, to give up the culture. Of course varieties must be chosen for local adaptations, and there are places near the coast which differ greatly as to their fitness for the peach. His own vicinity at Niles was about the same distance from the Bay as Mr. Tompkins at San Leandro, but he could grow a good peach at Niles—in fact, has known but one failure of the peach in the 31 years that he has resided in the district.

The discussion was continued with remarks by Mr. Hatch, Mr. W. W. Smith, Mr. Klee and others.

Other Matters.

A paper on paralysis of the apricot tree, prepared by Rev. Mr. Ongerth, was read by E. Steele. We will give the paper at another time.

A communication was read from the New York Tribune, the sense of which was to secure the views of various associations as to the desirability of revising the tariff. Schedules had been sent out to enable the societies to act upon any item which affects their interests. Owing to the length of the communication it was referred to a committee composed of B. M. Lelong, E. H. Rixford and Rev. A. H. Perkins.

On behalf of the State Board of Horticulture, Mr. Lelong offered the society the use of two rooms belonging to the board, rent free, which offer was accepted. Mr. Lelong remarked that the new offices of the State Board are located at 220 Sutter street, S. F., have an elevator and other conveniences and will make a fine headquarters for assemblages in the horticultural interest, and such it is the wish of the State Board to make them.

Mrs. J. M. Dyer of 334 Fremont street, S. F., showed some fine specimens of wax models of California fruits, finished in such a way that they will bear handling. The specimens were most true to nature and were much admired. Such models would be excellent to preserve the image of any new variety or true forms of standard varieties. Mrs. Dyer will make an exhibit at the Mechanics' Fair.

Plums and Prunes

Were chosen as the subject for discussion at the meeting on the last Friday in August. S. F. Leib and J. H. Flickinger of San Jose were invited to open the discussion. The society then adjourned.

FISH REFUSE.—The oils, glues, fertilizing agents, etc., prepared from the refuse of the fisheries of the United States realize 14 per cent of the total value of the fish captured.

THE ORNITHOLOGIST.

Dr. Gally Observes the Road-Runner.

A Living Bird-Trap.

EDITORS PRESS:—By reason of my limited knowledge of ornithology and all the other ologies, I formed a high opinion of the fast trotting bird known to Pacific Coasters as the road-runner. I thought that bird was a friend to economic agriculture, and as such I praised him. I take it all back. The road-runner is a pirate, and a sneak, and a robber; but he is a talented "cuss." Let me now tell you what I saw a road-runner do on the 3d day of June, 1887. Among my other small possessions I have a very interesting farm, where I do not reside, on the wagon-road from Watsonville to Santa Cruz, at a cross-roads called Sandford's (or Sandy's) Corners, and this farm is partly level plow-land, partly tule marsh, partly hillside covered with trees and hazel-brush, and partly upland mesa; so, as you can see, it is a great place for a variety of birds, small "varmint" and reptiles—in fact it is a sort of natural zoological garden. The gentleman who does me the honor to reside there lives back from the road about one-eighth of a mile, in a quiet cove of the hills, beyond the tule marsh, far from the madding crowd, and he keeps bachelor's hall and amuses his quiet hours petting and communing with the birds and reptiles. Among his favorites is a domesticated road-runner, which comes every day, morning and evening, down off the hills, to stay around the cabin and stable for a half-hour or more, before and after making predatory excursions into the tule. This bird comes within ten feet of Mr. Dunlap and stands there, tilting its long tail up and down, while being talked to by Mr. D.; and yet the road-runner is believed to be the wildest and least tamable bird in California. This bird has been offered a taste of all the eatables for horse or man upon the place, but only raw, fresh meat meets the approval of his taste—a newly killed mouse, or snake, or lizard suits him very well; but no fruit, or seeds, or cereal product attracts him. During the latest spring of the year this bird caught the smaller insects, but as the season warmed up he quit the insects and turned his voracious attention to bird's eggs, turtle eggs, young birds, toads, frogs and snakes. I think he can whip and devour any ordinary snake; but it is no unusual sight to behold him coming, as fast as he can leg it, out of the tule with two or three blackbirds pelting at him. The blackbirds have caught him burglarizing, for, as I said above, he is a pirate, a thief and a robber.

It is a frequent sight to see this domesticated road-runner walking about with a bird, a frog, lizard, or snake in his bill; but on the 3d day of June aforesaid myself and Mr. Dunlap saw him do something that is almost incredible. There is a colony of bank swallows in that neighborhood and we were cutting heavy barley for hay about 4 o'clock P. M., from a knoll of land, and I suppose we aroused the gnats, or some very small insect, and in search of these gnats came many swallows soaring around and around, and over and across the knoll of new-mown hay. It is well known that a swallow is about as swift a bird on the wing as there is any need of, and it is equally well known, in California at least, that a road-runner does not fly any at all unless on the down grade; yet, at the time and place aforementioned, I saw this domesticated road-runner catch three swallows on the wing in less than half an hour. Here is to say how he did it. You have seen a ground squirrel crawl flat on its belly, and so the road-runner, among the swaths of hay, crawled under the soaring swallows until a swallow came within four or five feet, directly over the crawling bird's head, when snap! quicker than the spring of a steel trap, the road-runner leaped into the air and brought down the swallow.

This I saw him do three times; and, what seems strange, the swallows never made the least struggle after being struck. That is what puts me down on the road-runner, and I say that any carnivorous bird that will leave 20 acres of frogs, toads, snakes and lizards to go and sneak up on innocent insect-eating birds and kill them in cold blood is not deserving of any man's respect. I have not interviewed the insects upon this subject.

As near as I can find out, the road-runner belongs to the family of the secretary-bird or snake-eater (*Gypogasterus serpentarius*), and yet the secretary is a bird of South Africa; but then it is none of my business to account for how the Creator distributed animals over the earth's surface. I leave that matter to those arbitrary and firm fellow-citizens who seem to be much better and more intimately acquainted with Deity than I am; all of which is most respectfully submitted to an observing public.

P. S.—It is to be noticed that while the road-runner will travel a tule-marsh in search of food, it is not a wader (*grallator*) or swamp fowl, but emphatically a dry-land bird.

J. W. GALLY.

Pajaro Township, Santa Cruz Co.

THE FIRST VESSEL to be propelled by electricity ever built in the United States is now in course of construction at a shipyard in Newburg, N. Y. It is a yacht 37 feet long, 7 feet wide and 5 feet deep. It is to be operated by stored electricity. It is building for a Newark, N. J., electric company, and will be run between that city and New York.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

The First Combined Harvester.

EDITORS PRESS:—I send you a poem, by Hon. E. Lakin Brown, of Schoolcraft, Michigan, in honor of the great "Harvester," invented and patented by Hiram Moore in the year 1835, and built on Prairie Ronde, Kalamazoo county, Michigan. It cut, thrashed, cleaned and bagged the wheat in perfect order for market, in one operation. In 1836 a trial was made for me, cutting three acres. It was tried and harvested some each year, but not made perfect till 1842. I usually operated the machine for Mr. Moore, and in 1843 built one for myself, and used it every year, including the harvest of 1853, when I sold it to George Leland, who shipped it to San Francisco, and harvested about 600 acres in Alameda county, in 1854, mostly for Mr. Horner. Some time afterward the machine took fire and was burned.

Tulare, July 23, 1887. A. Y. MOORE.

When Ceres first her bounteous gifts bestowed
And first with gold the ripening harvest glowed,
No tempered scythe flashed o'er the burdened land,
No ready sickle armed the reaper's hand;
But slow with tedious care, the skillful swain
Plucked with his hand the years of ripened grain;
With rude contrivance shelled the dear-bought
prize—
A scanty horde his wants but ill supplies.

But soon invention, sprung of direst need—
That only good to art by Jove decreed—
Fashions some implement, some ill-formed blade,
The weary gatherer's tedious tool to aid;
Which slow improvement—in her progress slow,
Yet still progressive—as the ages flow
Changes and alters, till she can late produce
The light keen sickle for the reaper's use.

O blade more honored than the warrior's spear!
At thought of thee what rural scenes appear!
The wide-spread field of yellow waving grain,
The laughing damsel and the jocund swain;
In numerous pairs their grateful task they ply,
The while in mirth and rustic wit they vie,
And rocks, and woods, and distant hills prolong
The merry echoes of the harvest song!
Such were the scenes that blest those happy days
Ere late refinement changed the maiden's ways,
When she no more may wield the shepherd's crook
Nor with her lover ply the reaping hook.

But, classic instrument, thy work is o'er,
Thy ancient glory shall be sung no more;
No more at eve when gentle dews descend,
Thy graceful curve shall o'er his shoulder bend
When the tired reaper homeward wends his way
To close his labors with the closing day,
Nor yet the cradle shall its honors keep,
And cut the yielding corn with lengthened sweep;
With its long fingers grasp the precious grain,
And strew the even swath along the plain.

How shall I sing how skill and art prevail
To join the sickle with the fan and flail?
How at one stroke the laden ears are shorn,
And ready sack is filled with winnowed corn?

Vast the machine, which wheels immense sustain,
And twelve proud steeds propel along the plain;
Huge as that fatal gift that bore concealed
Those treacherous foes who caused proud Troy to yield;

Or that vast car before whose crushing wheels,
O blind to truth! the Indian Pagan kneels,
But not for me in tuneful verse to name
The various parts of that ingenious frame,
Which with such skill a cunning hand hath wrought,
They move consenting to the maker's thought;
And the glad farmer sees performed the while,
By tireless hands, his tedious three-fold toil.

O wonder-working art! By heaven designed
To bring relief to weary human kind;
The curse to soften passed on guilty man,
And e'en remove it, if aught earthly can;
Since first our exiled parents learned of thee
To clothe their naked limbs from leafy tree,
No single work of thine will farther go
To lift that curse from off the laborer's brow!

Yet something, sober art, we lose by thee—
Thou leavest not the poet's fancy free.
Thy noisy progress in confusion flings
His peopled world of fond ideal things—
No mermaid haunts the steamer's dashing side,
To wile the sailor 'neath the briny tide—
Nor where all day thy clattering wheels have been
At night will gentle fairies dance upon the green.

From Santa Rosa.

We had the pleasure of meeting on Tuesday Bro. E. W. Davis of Santa Rosa, Master of the Grange. He has been unusually taxed in his labors of late, and we were glad to see that a short vacation was doing him good. Bro. Davis assured us that local preparations for the State Grange meeting were going forward with vigor and the efforts of the local Grange were met with much interest and cordiality by the people of Santa Rosa and vicinity. Attendants at the State Grange may be assured of a warm welcome and of good arrangements for their convenience and comfort. Santa Rosa will be proud of her guests on that occasion and will take special pains to display the charms of municipal neatness and beauty, enterprise, etc., for which the town has a good name, for the interest and entertainment of the Order. Bro. Davis reports Pomona Grange of Sonoma county especially busy with arrangements for display at the leading fairs, a work in which the good Grange-workers have won such signal triumphs in the past.

Grange Work and Progress.

(Prepared Weekly by M. WHITEHEAD, National Lecturer.)

After standing the test of 21 years' trial, the Grange is now one of the acknowledged permanent institutions of our country. The only questions to be settled about it now are those of locality, which must be decided by each individual farmer, or the farmers of any one neighborhood, each for themselves—and they are these: "Do I need the benefits of this farmers' organization?" "Shall my wife and children enjoy its advantages?" "Shall we, the farmers of this community, for ourselves and for our families, have a Grange right here?" "Do we need it for its social advantages?" "Do we need it for its means of education to be found in no other direction?" "Do we need it for its business or financial advantages?" "Do we need it as voters, as American citizens?" "Having done what we can to give our neighborhood the advantages of churches and schools, have we performed our whole duty to ourselves, our community and our country until we have made earnest effort to have a good Grange established here also?" "Are we able to do what farmers are doing in thousands of other places—maintain an organization in our own interest and for our own benefit?" We ask all farmers, young and old, near and far, to calmly, carefully, deliberately—not hastily—consider these questions. Investigate the Grange thoroughly. The truth never yet suffered under the brightest light or closest inquiry, and we fear not the result. The Grange has ever found the greatest opposition from those who knew least about it. In past years it has even had members who came in and went out again before they had really found out its A B C. Because the truth is becoming known, because it is seen and felt, the Grange work goes forward under clear skies and with favorable winds.

"WHEAT sold in Chicago on the 21st at 68¢, the lowest in 25 years. At that time it cost 30 cents a bushel to get it down here; the cost now is only 13 cents. The break is the result of the collapse of the bull clique. We think it a great misfortune for the country. Low prices for grain keep the farmer poor, and while he is poor we do not think there can be any prosperity. The wheat bears are like the railroad wreckers of Wall street; their gain is the very blood of the producer. They are ruining him and feeding Europe with cheap food. The press of this town is constantly urging the claims of the consumer, and ignoring those of the producer. The low price for wheat is closing the markets of the continent. To protect their farmers, Germany, France, Spain and Italy have put an almost prohibitory tariff on wheat. If we lose those markets we can thank the bears in grain. The low price here has made low prices there."—*Chicago Paper*. True enough, and be it remembered the Grange is using its efforts to secure legislation to prohibit gambling on 'change in farmers' products.

"WHO taught the American people, and their representatives in Congress, that 'the creature must always be subject to the Creator,' and after years of labor so educated the people, and their representatives, that it became possible to pass the measure known as the Interstate Commerce bill? This bill, though imperfect, is a glorious triumph for our Order, and a victory for the American people, for henceforth it will be understood that there can be no capitalized power in this Republic greater or more powerful than the people. If this is the only work the Grange ever did, it is worth all the time and money spent in maintaining and perpetuating the Order."

THE GRANGE in our State has been the starting point for the last 12 years of every movement that has been of any practical benefit to the farmers and fruit-growers, and it stands to-day foremost in every effort calculated to advance the interests and increase the happiness and prosperity of all our people. It is truly a power for good, and therefore we will not rest until we can hail every farmer as a Patron, so that by their combined wisdom and power the highest aim of our Order may be attained, and general prosperity assured.—*A. N. Brown, Master Delaware State Grange*.

WHILE there is much enjoyment in a good Grange, it cannot be kept up for the fun of it. There must be work about it—earnest, thoughtful work on the part of the members. This work must not be spasmodic. If so, the condition of the Grange will ebb and flow with the work put into it, and the danger is that all ceasing to work, its life may go out. It is only by persevering efforts continually put forth that this work can continue. If the mission of the Grange is a good one, it is worth working for.—*Farmers' Friend*.

ONE of the strongest arguments for the Grange organization is that its whole tendency is against selfishness and in favor of making farmers mutually helpful. And it must be added that the chief objection of some farmers to joining it is to be found in the fact that if they did join they would be expected to give information as well as receive it.

WORTHY MASTER A. J. ROSE of the Texas State Grange, writes: "Our State Grange meets in Marlin, Falls county, on the second Tuesday in August. We shall have Brother James N. Lipscomb with us at the meeting. With good crops this year the Grange of Texas is on the eve of a prosperity not before reached. The letters from over the State received at my office and the reports of the lecturers all indicate this."

WE have never known an organization among farmers that had such a glowing prospect before it as stands out plainly and invitingly before our Grange. Farmers only need now to realize their most sanguine hope to remain true to themselves and the obligations they have taken.—*H. H. Shippard, Texas*.

THE county Grange of Vernon county, Missouri, conferred the fifth degree on 40 new members at its July meeting.

"Let thy light keep steadily burning,
It perchance a friend may guide,
Who, from darksome ways returning,
Will be cheered by the full tide."

The Worthy Master Away From Home.

[NUMBER 4.]

[Written for the RURAL PRESS by MRS. WM. JOHNSTON.]

Another hour was pleasantly passed in listening to sweet strains from the guitar, rendered by one of the King's dancers; after which "Luau," or dinner, was announced. The King took the lead, with Mrs. Atkinson leaning on his arm, followed by Mr. Atkinson with the Queen's sister, others falling in two by two.

The tables were to the Americans a marvel. They were made of boards raised three or four inches from the ground. This small elevation is a departure from the old custom. The arrangement of these tables was odd indeed. There were three long ones, about 60 or 70 feet in length, joined at one end by snugly fitting in another. Upon these were spread fine linen table-cloths, nicely tucked in under the edges. Over these again were placed fern leaves, laid so that the edges just touched each other, giving a beautiful effect. Next came the dishes. For each guest were laid two plates, two knives and forks, three glasses, one bottle of champagne, one bottle of beer, one dish of "poi" (a viand much used among the natives) and one butter-plate, with salt on one side and a savory dressing, like a jelly, on the other. Thus was each one equipped at the King's feast.

The table was thickly set with small dishes, containing raw fish and shrimps, roast dog and pig, chicken and potato salads, and an abundance of cake. The shrimps were quite too lively, as some crawled off the dishes, which were placed so close together that they overlapped. The dogs and pigs were prepared by wrapping them in "ti" (pronounced "tea") leaves, and placing them in a hole in the ground, then covering them over with hot rocks. Fish is often cooked in the same manner. Choice bouquets adorned the table, together with pyramids of fruits and flowers, which added beauty to the magnificent arrangement. You were not obliged to partake of the liquors, as ice-water was provided in abundance.

The King sat at the side of the end table, opposite the center table. For himself and his most honored guests was prepared an extra dish of dog. These animals were of superlative quality, fed from infancy on "poi," till they are grown and fat, when they are served up in a kind of stew. At this table was served the most dainty drink of the Kingdom, whereof none were invited to partake save our W. G. M., Atkinson and family. I did not see the process of making this drink, but was told by good authority that it was from a certain root, by natives chewing it and depositing the juice, slightly strained through the teeth, in a wine-glass, to be used by those that are fond of the precious beverage. This was not offered me nor mine, but had it been I could have truly said, "No, thank you! I drink nothing intoxicating."

But my description of the "Luau" is not complete, and I will proceed. Along the sides of the table were spread rugs of Chinese matting upon which to kneel or sit while eating. Scattered along back of the guests were about 50 native girls, dressed in white "Mother Hubbards" and provided with feather brushes nicely arranged on whip-stocks, which made them pliant and easy to wave over the heads of those at the table.

Above all this grandeur was stretched a tent upon poles planted in the ground, well braced and covered with heavy canvas. The sides were curtained with American and Hawaiian flags. The King's band was stationed near him, outside the tent. After the King's health had been drank and responded to by his Royal Highness, they burst forth in expressive song in their native language, which proved most charming. They also played during intervals of the feast, that we might not grow weary in well-doing.

After lingering, kneeling, lounging or sitting tailor-fashion for about an hour and a half, the company adjourned to the grove, where we again had the pleasure of sitting upon chairs, and witnessed a race to the top of a coconut tree by three natives. They performed the feat as readily as monkeys. The King's dancers again gave an exhibition of their skill, and then all returned to their hotels, highly delighted with the day's entertainment.

Sunday, many of the party went to church, and on Monday we were invited to a stroll through the Government grounds and building. Tuesday, at 12 o'clock, the steamer Australia sailed for San Francisco, carrying a number of our party. Wednesday, we, the remainder, spent in shopping and resting. Thursday in visiting the "Pali," and Friday we rested hard all day, and received news from home. Saturday, many of the party attended the races, while others wandered or drove about town.

(To be Continued.)

Sonoma Pomona Grange.

The meeting of the Pomona Grange at Santa Rosa July 20th is said by the *Republican* to have been the most interesting and successful ever held by that body. Every subordinate Grange in the county was represented. The fifth degree was conferred. The usual Grange dinner was served, and much work for the Good of the Order done. The literary exercises afforded a fine feast of reason and of wit. The select readings were appropriate and exceedingly well rendered. Mrs. G. W. Huntley, Mr. Harris, Mr. and Mrs. L. O. Coon and

Misses Litchfield and Wightman, all of Sebastopol Grange, furnished excellent vocal music. A strong preamble and polite resolutions were adopted asking the Board of Supervisors to make an appropriation for the purpose of inducing immigration to Sonoma county.

After speaking with generous appreciation of the service which the Grange has rendered by her splendid displays at various fairs in advertising the resources of the county, the *Republican* adds: "Pomona Grange of Sonoma county has grown to be one of the most influential and useful bodies of this city. We congratulate its members on the good work done, and urge them never to weary in well-doing."

A Pony Swindle.

Another scheme for fleecing such folks as hope to get something for nothing has been successfully worked in Monroe county, Penn., and is thus described in the *Farmers' Friend*:

About the 1st of July a stranger commenced calling on farmers, business men and others (selecting those having children), with photographs of a number of beautiful Shetland ponies, which he offered for sale at \$5 apiece. At the same time he would give a full pedigree of each pony, guaranteeing the little animals to be perfectly sound, kind and harmless as a kitten. He said the reason he offered them so cheap was that he owned a large stock-farm in N. Y., and that they bred so rapidly that he had all the large circus companies overstocked, and was compelled to kill them or ship them out on the prairies, and there allow them to roam until they died or were disposed of in some manner.

To make his argument still more plausible, he said that the Delaware, Lackawanna & Western Railroad Co. offered such facilities that they were easily shipped to Stroudsburg, and would be as soon as a carload was sold.

After a pony had been selected, he would inform the purchaser that he must have the required amount of money to pay the freight on it, at the same time stating that all railroad companies under the new law compelled shippers to pay in advance, and that what they paid was not for the pony, but simply to cover the expenses of getting it to the purchaser. In that way he would get the required amount of money from each one. During his conversation he produced the best references, including names of citizens familiar to those he was dealing with at the time. Those whom he swindled say that his story appeared to be as true as gospel, and that he told it so nicely that all of his victims were sure they would get a pony for the paltry sum of \$5. Two weeks later, the time when the ponies were to arrive, a number went to the station to get them. They returned home sorely disappointed but wiser men. It is said that about 25 persons fell victims to the pony swindle.

THE WINE CROP OF 1887.—As stated in the *RURAL* at the time, Secretary Wetmore of the State Viticultural Commissioners sent a large number of circulars to all parts of the State, asking for information about the vineyards and the prospects for this season's wine crop. Nearly all of these reports have now been returned. From them, as well as from other sources of information, Mr. Wetmore calculates that this year's wine crop will amount to 16,000,000 gallons. Last year it was between 17,000,000 and 18,000,000 gallons. Had the vineyards not been damaged by frost or conlure the product would have aggregated fully 30,000,000. Some 3,000,000 gallons this season will be made into brandy. It is expected that the must-condensing machines will reduce the wine product about 2,000,000 gallons. Bids for the location of the must-condenser are still coming in. The St. Helena growers offered to supply 3500 tons of grapes annually, \$15 being charged for Zinfandel, \$12 for Malvoisie and \$10 for Mission. Proposals from Fresno were not received. A committee from Cloverdale offered to furnish grapes at a smaller cost than any of the offers received, but the quality of grapes would not be guaranteed.

RETURNED FROM JAPAN.—Mrs. H. H. Berger of H. H. Berger & Co., importers of Japanese seeds, plants and trees, has returned from Japan after having formed most important connections to secure a first-class stock of Japanese material for this fall's planting. Mrs. Berger brings, among other interesting things, a collection of bamboo specimens, from the Giant, seven inches in diameter, to the smaller varieties. We will allude to the collection further at another time.

THE FIRST AND LAST OF THE FAIRS.—We are indebted to the managers of the San Diego Horticultural and Agricultural Fair, and of the third annual Horticultural Exhibition of Santa Clara county, for complimentary tickets to the same. As it happens, these two displays, the latter coming Aug. 15th to 20th, and the other Oct. 28th to 30th, mark the outer limits of the California fair season of 1887.

THE GRIDLEY MONUMENT.—The statue of Ruel Colt Gridley and portions of the pedestal were received from Italy last week and taken to Rural cemetery, near Stockton. The work of erecting the monument was commenced immediately; and it is pleasing to think that this fitting memorial to the efficient patriot is likely soon to stand complete in the center of the lot of the G. A. R.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

MT. EDEN ITEMS.—Haywards *Journal*, July 30: W. C. Blackwood's apricot-drying operations along the Mt. Eden road attract considerable attention. He has about 25 children and grown people dissecting, and 70 Chinamen gathering the fruit. Crops continue to turn out well. Jacob Harder received on the average over 22 sacks to the acre, while one piece went 27 sacks to the acre. From 56 acres he realized 1200 sacks of chevalier. N. Gading, from 33 acres realized 806 sacks of chevalier, and from 27 acres of common barley 810 sacks. The boss yield so far was on the Zeile place—1025 sacks of barley being secured from 30 acres.

Butte.

IRRIGATING COMPANY.—Gridley *Herald*, July 28: A number of local capitalists of Oroville, under the management of Maj. Frank McLaughlin, have organized and incorporated the Butte and Yuba Orange Belt Irrigating Canal Company. The objects of the company are to obtain water rights, construct canals to convey water and sell the latter for household, domestic, irrigating, mining and manufacturing purposes. It proposes to secure 100,000 inches of water from the Feather, and construct a system of canals along the foothills east and south of Oroville for carrying the fluid to parties desiring to purchase it. The capital stock is \$5,000,000, divided into 200,000 shares at \$25 each. Messrs. F. McLaughlin, Charles St. Sure, John C. Gray, J. M. Ward, D. Hilton, E. W. Fogg and W. M. Cutter are the Board of Directors. Shares to the amount of \$95,000 are already subscribed for.

Contra Costa.

SWARMING SQUIRRELS.—Martinez *Gazette*, July 30: Last Friday, as Thos. Duncan of Clayton was inspecting his wheat stacks, he noticed a number of squirrels running into a single hole. He got his shovel and pick, called his dogs, and began to dig for the squirrels. In the one hole he captured 42, three of which had been smothered to death, so thickly were they crowded. The next day Mr. Duncan killed 26 squirrels around the same stack.

Fresno.

EDITORS PRESS.—Still Bros.' ranch, near Madera, consisting of 21,000 acres, has recently been sold to a syndicate of English capitalists for \$400,000. This ranch had the honor of producing the first barley ever raised in Fresno county. The greater portion of the crops have been thrashed. It has been a better yield than was expected. It is a poor crop that will not average 15 bushels to the acre. Peaches, grapes and other fruits are plenty. It has been very hot here, the thermometer standing as high as 116°. The last few days, however, have been comparatively cool. Heavy fires are raging in the mountains near by.—*Jr.*, Madera, July 30th.

SELMA PRODUCTS.—*Irrigator*: Yesterday George Kirkham brought in a handsome bouquet, consisting of 15 varieties of fruit neatly arranged in a box. Among the lot were Early Crawford peaches weighing half a pound each, Morris White peaches, two varieties of nectarines, four of apples, three of plums, two of grapes, Bartlett pears, and blackberries. These are of the varieties of fruits raised in this neighborhood.

Inyo.

FINE COLTS.—*Independent*, July 30: G. W. Parish has a three-year-old colt that is a beauty. He is of a glossy black, with broad chest, round body, limbs straight and powerful, eyes full and clear, muzzle small, nostrils wide and full. This fine animal is admired by all lovers of horseflesh who see him. He is of Hamiltonian-Planter stock, and is now 16 hands 3 inches high. . . . W. R. Tibbetts has the largest three-year-old colt in the valley. He is of Norman-Planter stock, very dark brown, and of fine form and build. Mr. Tibbetts has two colts of fine form and build. Mr. Tibbetts has two or three colts from him that show all the best features of the sire.

GRASS AND CORN.—On his place down at the river, W. J. Lake has corn standing from seven to eight feet high. It is quite common to find two to three ears to each stalk. Ground broken last spring and planted with oats and alfalfa is bearing a heavy crop. It is worth mentioning that this ground is where "nothing at all would grow;" at least "everybody" said so, except Billy Lake. On the farm of W. S. Enos near town, the growth of blue joint just cut was so heavy that a man had to go in front of the machine and pitch the cut grass out of the way.

Los Angeles.

WESTMINSTER CROP NOTES.—*Cor. Times*, July 30: The corn crop is now well forward, tall and green to the base, promising a large yield. Alfalfa is being cut for the third or fourth time. The second crop of Early Rose potatoes is being planted on the uplands. The lowland single crop of Peachblows and other approved kinds gives excellent promise. Stock is in good order. The last of the apricots have just matured, the season lasting since June 11th. Good peaches are abundant. So are apples and pears. Markets for all produce are better than ever before. Add to this the pure artesian water and the cooling sea-breeze, and

the ocean baths so easily obtained, and it may be said that smiling comfort looks out o'er the plain.

Placer.

IRRIGATING SCHEME.—*Republican*, July 27: F. Birdsall has been making careful personal inquiries among the millmen and irrigators, and finds that the necessity for water has not been overestimated under present conditions, and that if the supply is increased the acreage that will be put under cultivation is enormous. This is particularly true of alfalfa. . . . Mr. Birdsall will begin work on the Bear river ditch at Newcastle Oct. 1st with 500 men, and work up to the dam, a distance of about 60 miles. He will enlarge the ditch so that it shall be 12 feet wide at the top, four feet on the bottom, and its average depth will be perhaps five feet, or large enough to carry about 2000 inches of water. The cost is variously estimated at from \$25,000 to \$40,000.

EARLY GRAPES.—G. H. Banfield had ripe Rose de Peru grapes on the Sunset ranch in Mount Vernon district on Tuesday of last week, July 19th. On Wednesday he shipped some of them at Newcastle, and so far as heard from these are the earliest grapes of that variety in the State.

San Joaquin.

THE MOKELUMNE CANAL.—Telegram from Lodi, July 30: C. E. Grunsky, who is surveying the Mokelumne Ditch and Irrigation Co.'s line, told the *Independent* correspondent last night that while they were progressing finely, it was still too early to describe in detail the location and dimensions of the proposed canal. "I can state, however," said he, "that there are no great obstacles in the way of the canal's construction. The old dam is in an excellent, picturesque location, just below the Westmoreland, or the Winter Bar, suspension bridge. The canal will follow the course of the river for about three miles, and then pass through a tunnel into Camanche Creek valley, down the same about a mile and thence southwesterly into the valley of Bear creek. The main canal above Bear creek will have a total length of between seven and eight miles, and the water will there be delivered at an elevation of about 160 feet above Hunter street, Stockton, an elevation sufficient to command practically all the level land of San Joaquin county."

LODI MELONS.—To-day a crate of watermelons was shipped to Riverside as a sample of the productiveness of this end of the county. There were one dozen melons in the crate, aggregating 380 pounds in weight. Fifteen carloads of melons were shipped from Lodi this week. From 1200 to 1400 melons are shipped in a car, and the freight to S. F. is \$22.50 per car. For the first melons, sent hence the 20th, \$2.50 per dozen was realized. There was, of course, a decline in price after the first lots. They are sending some four or five carloads a day, very fair as to size and quality. There are some 1100 or 1200 acres in melons in this vicinity, and it is said they will turn out pretty well, but a little late.

San Luis Obispo.

WHEAT, BARLEY AND OATS.—San Luis Obispo *Telegram*, July 28: Returns from the harvest-fields indicate a slight falling off from last year's wheat crop in this county and an increase in that of barley of nearly 100 per cent. The yield of both is 50 per cent more than was expected three months ago, and the quality is excellent. The barley on the coast is enormous, going from 60 to 88 bushels per acre. The wheat on the coast is double the usual quantity, but east of the mountains it was generally light, though some heavy crops are reported. The yield of oats east of the mountains is very large.

Santa Barbara.

IMPROVING NEW ADVANTAGES.—*Press*: Metcalf & Co., on Monday, July 25th, shipped a carload of dried apricots East on the new railroad—the first through carload shipment from Santa Barbara.

ARTESIAN WATER.—On the lots of E. J. and E. W. Hayward, at a depth of 86 feet, a flowing stream of pure soft water has been obtained, the water rising two feet above the pipe. Another flowing stream was recently obtained on the U. Roberts lot, on Haley street, at a depth of 81 feet. When 40 feet from the surface the drill penetrated a six-foot vein of blue clay, such as is used for glazing crockery and which contains no gritty substances. This clay is said to be hard to obtain and worth at least \$50 per ton. The same vein was struck in the Roberts well. These wells cost but about \$1.25 per foot.

SANTA MARIA APPLES.—*Times*, July 30: We have received a box of apples this week from T. B. Ables' ranch, about eight miles southeast of town. It contains some of the finest summer apples that we have sampled this season from any place in this section, and we also find them much superior in flavor and taste to any shipped to Santa Maria from abroad. The principal varieties were the Strawberry, Early Harvest and Red Astrachan.

THRASHERS PROGRESSING.—Bell & Trott's thrasher is working its way down the valley. Mr. Trott says: "Scarcely any farmer that we have yet thrashed for ordered grain sacks enough at first; usually they have had to make the second trip to town after sacks." While grain is turning out much better than was at first anticipated, the thrashing season will not last as long as usual, for the straw is so short that

PACIFIC COAST WEATHER FOR THE WEEK.

EXPLANATION.—Cl. for clear; Cy., cloudy; Fr., fair; Fy., foggy; — indicates too small to measure. Temperature. Wind and weather at 12:00 M. (Pacific Standard time), with amount of rainfall in the preceding 24 hours. T indicates trace of rainfall.

the machines are putting it through at the rate of from 1500 to 2000 sacks per day.

Santa Cruz.

SUGARIE IN PROSPECT.—*Pajaronian*, July 28: It is reported that Claus Spreckels will construct a beet-sugar factory in this valley. We trust this rumor will become an assured fact. Years ago, when the Soquel beet-sugar factory was in operation, a large acreage in this valley was devoted to sugar-beet culture, and up to the last year it was found profitable. The yield of beets per acre was enormous, and no other crop then produced was as profitable.

Solano.

BIG BARLEY.—*Suisun Republican*, July 29: Returns from the Wolfskill barley-field, from which a large yield has been expected, have at last come in. Cal. Reams thrashed the eight acres, from which 400 sacks of clean barley were turned out, an average of 50 sacks to the acre—the finest yield ever recorded in the county.

Sonoma.

SILKWORMS.—*Cor. Petaluma Courier*: Prof. Joseph Neumann of S. F. brought to Sonoma, about June 4th, 175,000 silkworms, having previously ascertained that there were enough mulberry trees grown here to furnish food for that number. It has been very interesting to watch the development of those little worms from day to day, and to see with what energy they strive to fulfill the place that nature laid for them. The crop is about finished now, and is a grand sight. About 160,000 cocoons have been produced, and there are about 2000 yet to mature and spin that will take only a short time. Mr. Neumann has demonstrated practically that this valley has every advantage for the successful production of the best of silk on a large scale.

Sutter.

HOW THEY GROW.—Telegram from Marysville, Aug. 1: The growth of trees in the Abbott & Phillips orchard in Sutter county excites remark from all visiting nurserymen and horticulturists. The orchard embraces 395 acres, and consists of peaches, apricots, pears and plums. There are 300 acres of peaches alone. Despite the severe pruning of peach trees, 20 months from the time of planting budded yearlings have attained a height of from 14 to 16 feet and a diameter of trunk of from six to eight inches. The orchard has had no irrigation and is not on bottom land. In the same orchard are 200 orange trees, grown from seed planted on the place. These have never been injured by frost, although entirely unprotected since setting out. From last spring they have had no irrigation and have made an excellent growth. Phillips, the veteran horticulturist, says he believes considerable land in Sutter county is capable of raising oranges profitably with no irrigation. This soil is a rich loam 12 or 15 feet deep.

Tehama.

FINE APPLES.—Red Bluff *Sentinel*: The Board of Trade acknowledges the receipt of a box of fine white Astrachan apples from A. O. Pedan's ranch, seven miles below Tehama. They are the largest and best looking of the kind we have ever seen grown without irrigation.

Tulare.

NECTARINES.—*Visalia Times*, July 28: I. H. Thomas is now making daily shipments of nectarines south, and says his crop will net him three cents per pound—a larger profit than he makes on any other kind of fruit. On Monday he showed us a sample of the Downton, a yellow nectarine which will weigh three to the pound. It is certainly the most delicious fruit grown in this valley. Mr. Thomas says that the market for the nectarine is limited, owing to the fact that people generally know little concerning it. In the near future, however, he thinks that there will be an enormous demand for Tulare county nectarines, owing to their large size and delicious flavor. He says that at one cent a pound \$270 can be realized from an acre of ground set to nectarines. In this calculation he allows 108 trees to the acre, and a yield of 250 pounds to the tree. Mr. Anderson's orchard, near Farmersville, will yield 350 pounds to the tree this season.

TOMATOES.—In the Delta office may be seen sample tomatoes from the ranch of E. McClure, in the foothills northeast of Antelope valley and 25 miles from Visalia. Eight of these tomatoes weighed eight pounds, averaging one

pound each. Several tons of them are growing on Mr. McClure's place. The foothill region is well adapted to the tomato, and many instances have been chronicled in this paper of the vines living through the winter uninjured by frost.

Yolo.

GOOD RUN IN THRASHING.—A Yolo correspondent of the *Democrat* tells of the run made in one week by Hon. L. B. Adams' machine. He says: Monday, the 11th, on the ranches of Hiram Hurlburt and G. E. Schlosser, we thrashed 1600 sacks of wheat. Tuesday we thrashed 1358 sacks. Wednesday, the 13th, on the Bingham place, in grain owned by M. E. Clowe, we thrashed 1716 sacks of wheat, averaging 139½ pounds to the sack. Thursday, the 14th, on Ed. Bray's ranch and the Bingham place, we thrashed 1206 sacks and moved three miles. Friday, on the Anderson Bros. place, we thrashed 1379 sacks, and Saturday, same place, 1205, making a total for the week of 8464 sacks, which we think can't be beat. Mr. Adams has the latest-improved 40-inch Buffalo-Pitts separator and the Heald engine.

Santa Clara Valley Agricultural Society.

One of the oldest and most time-honored agricultural societies of the State of California will open the circuit of fairs and speed programs, commencing on the 15th of August and extending to the 20th, inclusive. The Board of Directors has made extraordinary efforts in the speed program, which has been well filled with our leading race-horses, by offering liberal prizes and other attractions that will make this, as they hope, one of the most important and attractive fairs ever held in the "Garden City."

The live-stock exhibition will be larger than any one ever held in this county, and extensive preparations have been made in building new stalls and sheds to accommodate the exhibitors. Prof. Van Tassel has made arrangements to ascend in a balloon, collapse it, when over a mile from the earth, and drop to the ground by means of a parachute.

As there are a large number of Eastern visitors in our midst, and thousands more who anticipate settling in California, we shall look forward with hopeful interest to such a showing as will attract the attention of those who may happen to be present, and will be the means of inviting others from Eastern States. With the attractions in and around San Jose, her beautiful grounds and accessories, this fair is expected to be one of the most marked events of the kind in the whole circuit. Everything points toward a most successful meeting.

'THE "Stockton Merchants' Exchange and Call Board" was organized last week with the following directors: J. D. Peters, George B. Sperry, J. L. Beecher, H. W. Weaver, L. B. Holt, C. Hurd and P. B. Fraser. The Board of Directors chose J. D. Peters, Pres.; Geo. B. Sperry, V. P.; J. M. LaRue, Sec., and P. B. Fraser, Treas. Daily sessions will be held as soon as the incorporation has been legally perfected.

THE \$160,000 which was appropriated by the last Legislature for the building of the jute-mills at San Quentin, it is said, will be barely sufficient to meet the demands for doing the work. By the strictest economy, however, and by lopping off here and there, the Directors hope to get along without creating a deficiency. The bids for the machinery, which are all in, are said to be very close to one another, showing earnest competition.

ABOUT 300 women and girls are at work canning apricots in the San Jose Fruit-Canning Company's factory, which is turning out over 2500 cans daily. There are now on hand at the factory 2000 barrels of sugar and 1,500,000 cans.

THE third issue of Scipio Craig's new Red-lands weekly, the *Citrograph*, comes full of meat, attractively and elegantly served, sustaining the promise of the opening number.

It is estimated that between \$500,000,000 and \$600,000,000 will be expended in railroad construction in the United States during the current year.

GRASSHOPPERS are preying upon the crops in Belgium.

My Friend.

To E. J.

(Written for the RURAL PRESS by FANNIE H. AVERY.)

'Tis little wonder that this friend
Has taught me to esteem her so:
Our hopes and aspirations blend
Together with an equal glow.

A many-sided soul has she—
All things have interest in her eyes;
No matter what my converse be,
She listens with a glad surprise.

Her heart she slights not that she may
Obtain of knowledge royal need;
But duty done, she flies away
To satisfy her mental need.

For she has learned that life's true goal
Is to attain a rounded growth;
And so she works for heart and soul—
Would raise the standard high of both.

Let me discourse of stars, or flowers,
Of mind and body, weakness, might,
Of Nature's forces, passing hours,
Of sorrow's depth or pleasure's height,

Lo! she attends with earnest ear,
And tender, sympathetic heart;
And adds, with feeling deep, sincere,
Her portion to discussion's part.

And when our children is the theme
On which we dwell in mutual thought,
In finer harmony we seem,
By little fingers nearer brought.

The present holds not all the good
We hope that both our lives may yield:
Our dear ones, now in babyhood,
For life's widespread and varied field

We would endow with lofty views—
With earnest, pure and thoughtful minds,
And all the strength that aye imbues
The spirits whom Right's influence binds.

San Francisco.

California Patriotism.

Centennial Fourth—Among the Rustics.

(Written for the PACIFIC RURAL PRESS by MALLIE STAFFORD.)

It has been said that "there is more patriotism in California to the square inch than in any other State in the Union." I indorse the sentiment in its fullest sense, will not abridge or take away a single point, or swerve from the assertion one inch.

Our marvelously fine climate is full of the lofty sentiment. Like an essence, and like the blue drapings of our grand and glorious mountains, it pervades all nature.

Living in an atmosphere the purest and clearest, and surrounded by such splendor of climate, such beauty of scenery, and so many natural kindly influences to woo and keep in tune a loyal heart, is it any wonder that the Californian holds in his breast the deepest and strongest sentiments of patriotism?

He loves his home and his adopted State with an ardor bordering on the wonderful, and entertaining such sentiments for his own beautiful adopted land, his love of country goes out, and radiates and expands until it reaches and embraces every nook and cleft of the whole broad Union.

Other countries boast of their grand fetes-days and many holidays. Rome may have her carnival, but with a pageant more splendid and a sentiment more lofty, our own "Queen City of the Sea" recently celebrated our National Independence.

It was an inspiring sight—the long lines of the procession parading the streets, headed by our distinguished General Howard; the buildings gaily decorated and adorned by the soft folds of the grand old flag; the pealing strains of martial music; the proud step and bearing as of old—the noble steeds keeping step to the inspiring strains.

There, too, were the war vessels, gaily decked in holiday attire, with banners and streamers floating from their peaks; and hark! across the bay, from the grim old fort of Alcatraz, gay with fluttering banners, came the deep boom of the cannon. The city and its environs, the bay and its islands—inland and sea—were a grand scene of gayety and festivity.

While this was being imitated in every city and town in the interior there was the same patriotism, the same lofty sentiment, though through force of circumstances less show and demonstration, among the rural population, particularly the grain-growing sections.

It was mid-harvest, and neither love of country nor love of ease and festivity could induce the average rancher to lay aside the header and thrasher, for there were miles and miles of ripened grain to be harvested. So it was a vital matter, one on which hangs thousands of dollars;

may more, there was "millions in it," and with a brow dripping with patriotic Fourth-of July perspiration, the "tanned toiler" entered the arena and garnered the shining grain.

A Rural Fourth-of-July Picnic.

Set in a niche of the temple of memory is one memorable anniversary that stands out brilliantly among—well, I will not stop to count—but it was Centennial anniversary in the country. All knew it was Centennial, but we were to have no celebration. Were there not thousands and thousands of acres of yellow grain waiting to be harvested, while the busy whirl and buzz of header and thrasher echoed through the length and breadth of the valley?

It were useless and idle to mention celebration; the swart grangers smiled derisively at the bare idea, and mounted their chargers in the battle for bread.

Cannot something be done? thought I, in my own heart. Must we, American citizens, with the blue blood of the Bunker Hill heroes "and cetry," surging through our veins, sit idly here alone on the glorious Fourth, while patriotic sentiment is on the rampage for a vent?

The question molded itself into an idea, and

It is too late to send to the nearest town. What can we do?

I was almost in despair; but my thoughts flew faster than my words, and remembering that I had some red and blue calico in the house, and of course muslin was at hand, I exclaimed "I'll make one!"

Just then my eldest daughter came in from the garden, and springing the "Fourth of July" on her "like a thunderbolt from a clear sky," I immediately brought out the materials and we went to work.

We had enough materials to make a tolerable flag. The stripes, by the aid of our handy sewing machine, were easily managed—but the stars! My Stars!

Nothing but the regulation five-pointed star would suit our Centennial-patriotic-Fourth-of-July-outburst, and it was some time before we succeeded in cutting them perfect. Cutting a five-pointed star is like a good many other things. It is easily done when you know how.

We had a deal of commendable patriotic pride in the manufacture of that flag. Wasn't it our flag and wasn't it Centennial Fourth? In view of these weighty facts that flag had to be perfect. There should be no country jokes cracked on it, no sly criticisms. We meant it

DRAPERY FOR MANTEL.

with a purpose and determination worthy of the cause, I gave it shape.

"June," said I, addressing my little daughter, "let's have a picnic on the Fourth."

"O mamma!" said the child, in delighted surprise.

"Now, June," I continued, "to day is the second, to-morrow is the third, and next day is the fourth. If we can get word to the Browns, and the Jones, and the Simpsons, and they will let others know this evening, I don't see why we can't have a fine Centennial picnic. But," I resumed, "it is now too late to call a meeting and arrange the program. So, June, you and I will constitute the meeting, and decide to have our picnic in the pretty grove of willows across the creek below the orchard."

"O mamma!" and the child jumped up with patriotism and enthusiasm bubbling out of every pore, "I can ride down the valley this evening and let them know. There is 'Old Croppy' now in the pasture. I can get the surcingle and be off in ten minutes." In less than ten minutes she had tied on her little straw hat, surcungled the trusty old horse, and was galloping down the road.

I then, having unanimously elected myself master of ceremonies, general in chief, and marshal of the day, began thinking of preparation.

Woman-like, the cooking was the first thought. But soon visions of far-away "Fourth's," with banners and flags floating gaily on the breeze, came to my mind. "A flag! Oh for a flag! I don't believe there is a flag in this poky little valley," I said aloud. "Not a blessed yard of Uncle Sam's bunting!

should be a flag which would not only grace the important occasion, but one which every lover of his country would be proud of.

Well, before the sun had set it was finished.

There was the requisite number of stars stitched neatly down on the bright, blue field, and when we attached it to a pole, pro tem., and flung its gay folds out to the breeze, do you wonder that our patriotic bosoms swelled with enthusiasm and pride? But we folded it away to keep as a grand surprise. Everybody knew (and now I look upon that community—myself one—with unfeigned pity and sorrow) that there was not a flag in the valley. And wouldn't they all stare and hurrah when they saw our flag floating gaily in the Fourth-of-July breeze?

When June came home she reported that the neighbors were unanimous for the picnic and there would probably be quite a gathering.

The next day was one of arduous toil—every Granger woman knows what it is to get ready for a picnic. There were the turkeys and chickens to kill, and pick, and stuff, and roast; cakes to bake, pies to make, coffee to prepare, in short everything, too numerous to mention.

The picnickers were astir early on the auspicious morning, and at a seasonable hour there came rattling up to the big gate the respective vehicles of the Browns, the Jones, the Simpsons, and the neighbors, all "loaded down to the guards," while following in their wake or centering in their van were straggling parties on horseback; so comprised a goodly company attired in holiday costume, and expectant of plenty of fun.

Early in the morning we had unfolded our

"starry banner to the breeze," and aloft on a pole full 10 feet above the top of the chimney, its dazzling folds toyed with the atmosphere of our Centennial anniversary.

As each party arrived they halted in front of the gate, and waving their hats and kerchiefs made the air ring with cheer after cheer for the flag, and many were the exclamations and questions in regard to its origin. When did you send for it? Where did you get it? etc. We did not, just yet at least, dare tell its low origin—how it had been "borned" and first caught the light in its dazzling folds in a lowly cottage far from the birth of freedom and seat of heroism, and had not been cradled under the shadow of Bunker Hill or first breathed the patriotic air of Lexington or Concord, or, fresher and more inspiring, that of famed Sumter or Gettysburg.

As the last reinforcements arrived, we adjourned to the grove indicated. I armed myself with a copy of the Declaration of Independence, and also the Centennial number of the *Rural Press*, which, having come with the mail the evening before, contained, besides other interesting "Fourth of July" matter, an illustration and history of the old famous "Independence Bell."

I omitted to mention that there were several well-grown youths in the company, besides a few superannuated and "unseaworthy" Grangers, who, through plea of headache, too much fat, or, more plausibly, in anticipation of roast turkey and Fourth of July good things, had deserted the army of harvesters and enrolled themselves in the ranks of patriotism. We were glad they had come; it looked good to see them there, more particularly when it came to transporting our heavy lunch-baskets across the stream, the place being of such a nature that our vehicles could not reach it.

It was a lovely stream, clear as crystal, flowing over a pebbly bed; every tree and rock and object was imaged in its clear depths. It averaged a depth of 18 inches and was about 50 feet in width.

There were many beautiful groves handier, but the chosen spot was just across the stream. As every one was in a mood centennial, there was no revolt, and across the stream we prepared to go.

There was a general pulling off of boots and socks, shoes and stockings. The young ladies, in their crisp muslins and gay with their fluttering ribbons, mused, and catching an idea, sent a small boy for a couple of saddle horses, but the matrons, less shy, and bent on taking in the day for all it was worth, bared their tender feet, and, amid shouts of laughter, were soon wading the stream. The Grangers, no longer superannuated, had suddenly merged into the stalwarts, and with lunch-baskets on their shoulders, were splashing through the clear water. What shouts of mirth; what screams, as the children and mammas and portly uncles and papas splashed and waded through the clear, cool water! Dignity was laid aside, and there was a perfect abandonment of mirth.

It was near noon before we were fairly across, and certain unmistakable symptoms in our anatomy began to warn us that lunch would be appreciated. The company was called to order, a few timely remarks, suitable to the occasion, were made. On motion, the Declaration of Independence was read by a good reader in a clear, distinct tone; everybody listening attentively as though it was a revelation from heaven—which it was.

A grand old song was next commenced in sweet and ringing tones by the owners of the fluttering ribbons, which was supported and assisted by the aspiring youths in rich tenor, and the deep bass of certain of the aforesaid stalwarts (nee superannuated). Out upon the stream and over across the tawny fields, its echoes floated, mingling with the breeze that dallied with the flag above our heads and the willows that dipped their waving foliage in the rippling waters. The *Rural Press*, meantime, had been passed from hand to hand, and it is worthy of remark here that the Independence bell and its famous history had never been heard of before by many of the younger members, also most of the children had never before heard the Declaration of Independence read.

The song was scarcely ended when a deep bass voice remarked, "It's time for lunch!" The cry was immediately seconded by the tenors and sopranos, until every tone of voice was represented, and it was taken up and encored among the juveniles.

"Lunch! Coffee! Who'll make the coffee?" But the coffee had already been made by one of the patriotics, and was brought steaming hot. Snowy tablecloths were spread and the Centennial repast ready.

Amid much merriment each one found a convenient seat, and with all absence of constraint and such riotous good feeling and genuine merriment, which latter is generally painfully absent in more elaborate and more ostentatious celebrations, we dissected the chickens and the turkeys, enjoyed the steaming coffee—intermingled with impromptu speeches, music, orations and burlesque toasts.

So passed the memorable dinner, and the hours following until near sunset were whiled away in games and amusements with no end to mirth and good feeling. Such was Centennial in the obscure valley of B. Will any one who was present that day see and recognize the picture? for, as Huckleberry Finn would say, "The truth is told—mainly."

There was one fact demonstrated that day,

that is, that patriotism may slumber in the American bosom—it never dies—and needs but a spark to kindle to warmth and splendor its brilliant beams.

Liddell, Cal.

Curios of Literature.

The following, though not a "phaximily," is a literal copy of a letter lately received by a San Francisco merchant from a country correspondent:

I wish you cood send me 2 man that can Trash by Hand, the good Trasher chanely comes from Baden Wurttemberg Baiern (ol Contry) I got Ry. it got to be Trasht with Flaile. I will pay for Trasher 1.00 and if He suds, if He can Trash with me I. will pay mor I. do not cear for 25. or 50. if I. can git 2 good Trasher, send one or both as soon as you can Franch and Irish som good Trashers I. will gif a Brandy by Starding in the morning. Bragfast 6 A. m. Lunch. 10. A. M. Diner 12. M. Lunch. 4. P. M. Soper. after 6. or 7m I. agra ono Month Work. if the man Suts al Somer

A Visalia paper reprints, *verbatim et literatim*, a letter picked up at I. H. Thomas' fruit depot. The address on the envelope reads "ih tomomos, visalia, tilare county, Califona," and the letter is as follows:

"tocsone June th 21 22

mr tommas

Sir wood you please in form me i sea in the times that you ship frud to arsona and new mecco please in form me the cost of shiping say to tocsone for a smal lot 1 2 3 100lb at a time and wood you pay the frad if i send you the monny to pay for the frud and frad a nom ber one frud how long wil it be till you can ship aplea a good qualie please oblige

Direct to tocsone pemo co arsona"

Mantel Drapery.

This handsome and graceful mantel drapery is made of plush. Where the lambrequin is draped is placed a bunch of cord loops, and at the opposite side, where the slash is made, the edges are laced together with cord run through eyelets and tied at the bottom, the ends being tipped with large plush balls. A beautiful spray of flowers *en applique*, in two parts, decorates the lambrequin. The spray is a selection from Kursheedt's Standard satin floral appliques, of which there is a large variety. A board that fits the mantel perfectly is covered smoothly with the plush, and to it the lambrequin is secured. A few pretty ornaments on the mantel is all that is desirable, and when the fire is not lighted in the grate, a Japanese parasol will make a charming screen. China or India silk, Surah, cloth, cretonne, velvet, plush, pongee or any preferred material may be used for the lambrequin. On thin goods, painting or outline embroidery is very effective, and a fringe of small ornaments may be added to the edges, if desired. Ribbon may be used instead of the cord, with good effect.

HER PURPLE MUSTACHE.—"To catch up a bottle of perfume and dab the stopple at one's upper lip," said a fashionable girl to me, "is a fashionable trick with many women, I know. I've seen lots of women do it and did it myself till the other night. Starting to see Langtry, I did that trick in a dark room and have quit it altogether. You see I ran back for a glove-buttoner, and prowling over the dressing-case struck the glass stopple of a bottle of 'Cherry Blossom,' caught it up, and smoothed it across my upper lip, and gave two little dabs behind my ears, so my neighbors should have a smell. 'Tian't 'Cherry Blossom,' after all,' thought I; 'it's the 'White Rose' extract all the same.' And I pranced down and joined my party. We had got into a car when some one said: 'Good mercy! What have you got on your face?' 'The usual amount of powder, I suppose,' I replied aggressively. 'Why, you've got a dark purple mustache.' Great heavens, it broke on me in a minute. That nasty bottle of scented ink that I myself had carelessly left on the dressing-bureau. There was no Langtry for that night. Ninety-six washings only weakened the stain. Sandpaper and pomace-stone have removed some of my lip, but it's so dark now (ten days ago it happened) that folks say to me: 'You must stop using that vaseline, you certainly are getting a mustache;' and just behind my ears are two spots that look as if mortification had taken place."

HOW HE GETS THE 'SIMMONS.—One of our exchanges tells about a sagacious old ram in North Carolina that can not only distinguish the persimmon trees from others in the pasture, but has learned how to get the fruit down from them. This he does by butting the tree. He goes off a suitable distance, stands on his hind legs, and strikes the tree a vigorous blow with his head. When he has shaken the persimmons off he quietly eats them and goes on his way until his appetite demands more. This wise old ram used to rob the apple trees in the same way.

YOUNG FOLKS' COLUMN.

A Dolly's Lament.

I'm only a last year's dolly!
I thought I was lovely and fair—
But alas! for the cheeks that were rosy,
Alas, for the once flowing hair!
I'm sure that my back is broken,
For it hurts me when I rise!
O, I'd cry for very sorrow,
But I've lost out both my eyes!

In comes my pretty mistress,
With my rival in her arms,
A fine young miss, most surely,
Arrayed in her borrowed charms!
My dresses, and my slippers, too,
But sadder, O, sadder than all,
She's won the dear love I have lost,
For I'm only a last year's doll!

O, pity me, hearts that are tender,
I'm lonely, and battered, and bruised,
I'm tucked out of sight in the closet,
Forgotten, despised, and abused!
I'm only a last year's dolly,
Alone with my troubled heart;
O, sweet mistress, still I love thee,
Inconstant though thou art.

Don't be Afraid.

When Rev. Charles Deems of the Church of the Strangers in New York City wanted money to pay off a debt on the building, he called on Commodore Vanderbilt.

"Are you going to preach what I want to hear?" asked the old man, sternly.

"I shall try to preach acceptably," answered the clergyman, in an evasive manner.

But no sooner had he said the words than all the manhood within him rose in revolt, and the

THE CHILDREN'S FRIEND.

spirit of John Knox seemed calling him to account.

"I shall preach the gospel as I believe and understand it, and if you have any special sins I shall be most likely to preach against them."

"Humph!" said the Commodore, and ended the interview.

The next day he sent Mr. Deems a check for \$50,000 for not being afraid to do his duty.

Politeness Well Repaid.

On a crowded East Boston horse-car the other evening, the seats of which were nearly all occupied by men, a cutting rebuke answered by a neat compliment was overheard. Shortly after the car left the ferry there got aboard a young lady, whose pallid and careworn face marked her as an invalid.

None of those having a seat at their disposal deigned to offer a seat to the one who seemed most in need of the resting-place till at the further end of the car a roughly dressed workman, seeing her plight, beckoned to her, and, resigning his seat in her behalf, said:

"There don't seem, Miss, to be any gentlemen on this car."

"I beg your pardon, sir. I am sure there is one," she replied, gratefully, as she accepted the seat.—*Boston Budget.*

LITTLE CARPENTERS.—Teach the boys to be helpful in the house. There should be a set of carpenter's tools in every house, and if there are no boys in the family, very often the girls or the mother can handle a hammer or screw-driver almost as well as most men. All healthy boys like to work, and the kind that they prefer is usually something in which they can use hammer and nails, as the use of these tools comes as natural to boys as the needle does to girls. A handy boy around the house is a great help in keeping the furniture in repair. If there is a shelf wanted for mother's plants, he is always delighted to make it, and usually it is done very well and correctly. If a skirt-board is what is wanted, or, in fact, any of the many articles of this kind so much needed in the household, say a word to the amateur carpenter intimating the article needed and in a

short time he is at work with rule, plane and saw, trying to evolve to his and the house-keeper's satisfaction whatever is desired. Where there is one of these young mechanics in a family, the furniture is never out of repair, for he will attempt to mend almost anything, though he may not do it as well as a man who makes his living at it.

GOOD HEALTH.

Hints for the Sickroom.

The sickroom should have plenty of fresh air. This is especially necessary in cases of fevers. An inch at the top of a window and an inch at the bottom may be allowed even in cold weather. Sick persons will not take cold any quicker than well ones, if the draught does not strike them. Where there are windows in the opposite sides of a room the task of ventilation is easier, but there must be greater care with the draughts. If the bed is where a draught cannot be avoided, cover the patient up and let ventilation take place, at least three times a day. Keep the inside air as pure as that outside, without chilling the patient. A fire in the sickroom to take off the chill will enable one to give it full ventilation.

With sick and well folks the greatest danger from taking cold is in getting up in the morning. The circulation is then sluggish and exposure tells with double effect.

In most diseases there is much less heat generated in the body than in health, therefore the temperature of every sick person should be noted. If it is inclined to run down, raise it by means of warm bricks or hot water bottles. The period of greatest decline is apt to be in the morning, and on till 10 or 11 o'clock. If a sickroom becomes offensive, the best dis-

bedside from meal to meal. Sight of what not craved is repellent.

Don't fill a patient's plate. Have tempting quantities temptingly prepared and served. Cook with care.

As a rule, you can afford to give to a patient a little of whatever is craved, unless the physician forbids. Sometimes the craving is morbid; then you can refuse to gratify it.

Ever watch the bedding. Keep the sheets clean and dry. Change the clothing often. Never let a bed get damp or foul. Don't load a patient with bed-clothing.—*Ex.*

A SIMPLE CURE FOR RHEUMATISM.—A correspondent of the *English Mechanic* says: Let ail of "ours" know the following: My wife has suffered occasionally with acute rheumatism in her feet, with painful swelling, completely taking her off her feet for many days at a time. The following remedy was recommended recently and tried, and took away the agonizing pain in less than 15 minutes, and she can now walk very fairly, and in a couple of days she will be able to button her boots and walk without a stick or crutch: One quart of milk, quite hot, into which stir one ounce of alum; this makes curds and whey. Bathe the part affected with the whey until too cold. In the meantime keep the curds hot, and, after bathing, put them on as a poultice, wrap in flannel, and—go to sleep (you can). Three applications should be a perfect cure, even in aggravated cases.

DOMESTIC ECONOMY.

Time-Table for Boiling Vegetables.

The following is Catherine Owens' time-table for boiling vegetables:

Potatoes, half an hour, unless small, when rather less.

Peas and asparagus, 20 to 25 minutes.

Cabbage and cauliflower, 25 minutes to half an hour.

String beans, if slit or sliced slantwise and thin, 25 minutes; if only snapped across, 40 minutes.

Green corn, 20 to 25 minutes.

Carrots and turnips, 45 minutes when young, one hour in winter.

Beets, one hour in summer, one hour and a half, or even two hours, if large, in winter.

Onions, medium size, one hour.

Rule—All vegetables to go into fast boiling water to be quickly brought to the boiling point again, not left to steep in the hot water before boiling, which toughens them and destroys color and flavor.

This time-table must always be regulated by the hour at which the meats will be done. If the meat should have to wait five minutes for the vegetables, there would be a loss of punctuality, but the dinner will not be damaged. But if the vegetables are done, and wait for the meat, your dinner will certainly be much the worse; yet so general is the custom of over-boiling vegetables or putting them to cook in a haphazard way, somewhere about the time, that very many people would not recognize the damage. They would very quickly see the superiority of vegetables cooked just the right time, but would attribute it to some superiority in the article itself, that they were fresher and finer, not knowing that the finest and freshest of vegetables, improperly cooked, are little better than the poor ones.

How to Cook Veal Cutlets.

Wipe, remove the bone, skin and fat from a slice of veal; cut into pieces for serving; season with salt and pepper; roll in crumbs, dip in egg-crumbs, and egg and brown in salt pork fat; put into a stewpan; make a brown gravy by browning one tablespoon butter and two tablespoons flour; pour on slowly two cups of hot stock or water; season with salt, pepper, add one tablespoon of mushroom catsup and one teaspoonful Worcestershire sauce; pour over the cutlets and simmer 45 minutes.

A well-known market man says people often ask for veal for cutlets, but they haven't the remotest idea what portion of the meat they wish. A slice from the leg is used, and it should not be very thick; if too thick, pound it. Cut up into pieces of a suitable size for serving, and if some are not of good shape skewer into form with a toothpick and this will hold them in place until stewed, when it can be removed.

The object of the frying is merely to brown the cutlets.

Water will do as well as stock for this brown sauce, as the cutlets are to be stewed in it. For a brown sauce, which is to be poured over a dish of meat, the stock is better on account of the added flavor.

The two tablespoonfuls of flour is a rather large amount, but when flour is browned it needs a greater quantity than when a simple thickening is desired, as the browning uses up its thickening power. Season as directed in the recipe. Many will prefer the flavor of the mushroom catsup and will use that exclusively. Pour the sauce over the cutlets in a saucepan, cover, and stew slowly for three-quarters of an hour.

This is an excellent way in which to cook veal, as it gets thoroughly done and is very tender—a consumption most devoutly to be wished in any dish of veal.

The Week.

The sensation of the week comes along just as we go to press on Wednesday. Wheat on Call, which has been overriding a world's values until it reached 2.17½ per cental, reached a climax this morning, when the sessions of the Call Board were officially discontinued until further notice. The leading spirits in the bull movement gave notice that the banks would not furnish them more money, and therefore they could not proceed. Consequently they make a proposition which is described in our market reports. Those who are supposed to know say that the arrangement if carried out will prevent a collapse and obviate a recurrence here of the disasters which fell upon Chicago when the corner broke there a few weeks ago. The fact of the matter seems to be that wheat has been rushed into the corner faster than it could be stored away and the men in the corner had to cry for quarter. Farmers have in many cases made haste to unload their grain at the wonderful prices, and the saying goes that everything that could run on a railroad has been covered with wheat and sent to tide-water. The Western farmers flooded Chicago with wheat at the time of the inflation there, and California growers also seemed to know a good thing when they saw it.

LATER.—Just as we go to press it is announced that the proposition of the corner as described in our market column is accepted, and it is expected that the affair will quiet

down without collapse. There will be some money lost, but affairs will not be unsettled as they were at Chicago. It is announced that the Call Board will not reopen until danger of a crash has passed.

The Pacific Railroad Commission.

The Commission appointed under a recent law of Congress to examine into the cost and management of the railways constructed with Government aid is now in session in this city. The Commission consists of three members, ex-Governor Robert E. Pattison of Pennsylvania, E. Ellery Anderson, a leading lawyer of New York City, and David T. Littler of Illinois. The sessions of the Commission's meeting are being held in the railroad building in this city, and promise to extend over considerable time. The public is entitled to admission except when the Commission consults executively. All testimony is given in public.

The investigation has but just begun, but it seems to be apparent that the Commission proposes to make a thorough investigation and to bring to light much that the public should know. It promises not to be content without full display of the books of the company and all kindred matters, and if the company makes statements of cost of construction, etc., they must be supported by evidence. This is the right way to proceed. It will be the only way to satisfy the public. There must always be a doubt how colossal fortunes could be built up in so short a time, if the construction actually cost the full amount of the Government's donation, unless it can be actually shown that the expenditures were really and legitimately made. It will be well both for the builders of the road and the public to have a clear light thrown upon the transactions, if there is really nothing to conceal. For example, Senator Stanford, at the meeting of the Commission on Tuesday, gave the cost of the Central Pacific at \$47,889,000, or \$55,600 per mile. Members of the Commission intimated that it must be shown that the payment of such sums of money by the Central Pacific Company to the Construction and Finance Company were not greater than the actual cost of the road would justify. Mr. Stanford affirmed that not a dollar was expended in a way that was not perfectly legitimate. On this point testimony will be welcomed by the public.

Another point advanced by Governor Stanford is that the company having built the road according to the specifications of the Government, was entitled to what the Government offered for such an achievement, whether the actual cost was less or not; that the railway was in no sense an agent for the Government, but a contractor to whom the Government should pay and could demand no accounting. One of the Commission properly suggested that in that event the railway should discharge its obligations in payment of the bonds the Government holds when they mature. Mr. Stanford replied that the Government had so hampered the working of the road that the bonds could not be paid.

All these matters will form topics for inquiry. We mention them merely to show that the investigation is taking a form which promises to allay much public doubt, and thus do much good. The Commission should enjoy the moral support of the people in its work, and we trust it will not be withheld. We look upon the investigation as one of the most important ever held.

THE STATE BOARD OF TRADE.—The idea which has been discussed for some months of uniting under a central head the various local Boards of Trade, was realized on Tuesday of this week by the organization of the State Board of Trade. At the meeting there were present about 40 delegates, representing nearly as many localities from Fresno on the south to Red Bluff on the north, and from the coast eastward to Sacramento. There were many representative Californians included and the movement seems promising. A. T. Hatch of Solano was elected president and the choice of minor officers was intrusted to the Executive Committee. San Francisco was chosen as headquarters and the next time of meeting set for August 15th.

THE evidence against the Chicago hoodlums is so glaring that three lawyers have withdrawn in disgust.

Constitution Centennial.

Great preparation is being made to celebrate the Centennial of the Constitution in Philadelphia, which occurs on the 17th of September. The Quaker City should not be allowed to monopolize this event. It belongs to the people and should be celebrated throughout the country. We spend a great deal of powder and rhetoric on the Fourth of July, but the birth of the nation really dates from the formation of the Constitution. All prior time was preparation and prophecy.

Perhaps no such convention ever assembled in the halls of a nation. It was composed of 55 men, giants in intellect, great in moral character and high social position. Twenty-nine were university men, and those who were not collegiates were men of imperial brain and pre-eminent common sense. There was Washington, the revered patriot and soldier, Franklin, the venerable philosopher, and Madison and Hamilton, the most profound publicists of the age.

Then their work was unprecedented. It was the first time the energies of a people had been girted in a written Constitution. Many English writers still think it is too stiff, artificial and methodical. They claim the English Constitution, founded on immemorial usage, is far better because it is more plastic and adaptable. That society does not run like clockwork. That the thoughts, feelings and passions of the people cannot be taught to run in long, straight, narrow flumes. The channel of public opinion and caprice is often very crooked, its motion uncertain; sometimes it dashes, surges, and foams with terrible fury, and sometimes it is slow and sluggish. Now they say it is too formal and mechanical to try and hold these ebbs and flows, these calms and waves of popular movement, in fixed and inflexible methods of action. Our Government holds indefinitely, but may be dissolved at any moment. Should there be a ground-swell of discontent among the people, we can immediately dismiss the obnoxious administration and go upon the country. You have no such safety-valve in your system which you can touch at any moment when under high pressure. And it does seem at the first glance that they possess some advantage over us, for they can at any emergency have just such men in power as they desire, while we must wait until the term of office expires before we can hold an election and select men in sympathy with a majority of the people. But we need waste no admiration upon the flexibility of the English system, for it is a notorious fact that members belonging to the opposition often vote for a measure against their own convictions for fear of defeating the ministry and bringing on a crisis in which they will have to incur great expense and danger in holding an election during a heated state of the public mind. We are in no such nervous dread of flying to pieces at every popular tumult. Our political life moves at fixed intervals with an unerring regularity as the tides, and that is certainly safer than to be compelled to go upon the country in a tumultuous storm at any moment.

Then our forefathers knew what they were about. The Constitution they made is not the stiff and inelastic thing these English writers think it is. It has life in it, and grows and expands commensurate with the growth of political ideas and the wants of the nation. Within a few years after its formation, it grew liberal enough to throw a bulwark of protection around the freedom of religion, speech and the press, protecting persons, homes and papers from unreasonable search and seizure, and securing to every one accused of crime a speedy trial before an impartial jury, and that cruel and excessive bail shall not be required. The Thirteenth, Fourteenth and Fifteenth Amendments garnered up all the legitimate results of the Civil War and made them a blessing to posterity for all coming time. Indeed it would seem the swift whirl of events for the past 25 years had put the Constitution of the United States to every possible crucial test.

And then our forefathers grasped the fundamental principles of humanity when they framed that instrument. Great changes have come over the governments of Europe; some changes have taken place in our national life, but our system has been found adaptable to the progress of the people. It voices the brotherhood of the race. It sweeps the horizon of

humanity. And now, as the first Centennial is nigh, we may proudly contemplate the work these men produced and the grand history we have achieved under it. It is a good time, not for windy eloquence but for thoughtful study of that architectural structure that roofs over all we hold dear in home and country.

San Joaquin Valley Irrigation Maps.

From time to time we have spoken of a grand map of the San Joaquin valley which has been in preparation for years in the office of Wm. Hammond Hall, State Engineer at Sacramento, embodying the results of long periods of field work. The original map is on the scale of one-half inch to the mile, with contour lines for every 20 feet of elevation. It was decided by the last Legislature that this map should be lithographed and issued in four sheets, with the scale reduced to one-third of an inch to the mile, and that the maps should be sold at about their cost to all who desired them. This work has been accomplished and we have received specimen copies. The map is in four sheets, showing four sections of the valley, beginning at the north. Each sheet is bordered so as to make in itself a complete map of its region; but the borders can be cut or turned so as to admit of the sheets being matched together, thus forming a continuous and complete map of the San Joaquin valley, from the Mokelumne river to Tehachapai pass, and including the foothills of the Sierra Nevada mountains and the Coast Range.

The maps seem to be very creditably done and probably set forth the topography and agricultural features of the large area better than any similar portion of the world. By means of the contour lines and the numbered land sections, one is able to tell the inclination from a certain point in the valley to any direction.

All canals and ditches are shown much in detail from original work of the State Engineering Department, thus affording a knowledge of the location of irrigation works never before attempted over this region. The lands irrigated are tinted in blue; the lands moistened by irrigation, in light-blue; swamp lands, in light-green; bottom lands, in darker green; and lands upon which water can be carried by means of large canals appear in light-rose color, while those to which water rights attach are covered with a dark-rose or red tint. All artesian wells, to the number of several hundred in this valley, are located on this map, and each is numbered to correspond with the number of its history and description to be printed in the report.

Thus can be seen at a glance what has been done in the way of actual irrigation, directly and indirectly, and what can be done or accomplished by large works, if the water supply proves to be sufficient.

Such a piece of work is very creditable to the State and will serve of practical benefit in many ways. According to provisions of law the maps are furnished at about their cost, viz.: \$1 for the set on paper or \$2.50 mounted on cloth. Applications for them should be addressed to Wm. C. Hendricks, Secretary of State, Sacramento, Cal.

THE STATE BOARD IN NEW QUARTERS.—The State Board of Horticulture has taken possession of its new office in the Hayward building, 220 Sutter street, where we had the pleasure of finding Secretary Lelong one afternoon this week. The office is on the fourth floor, to which an elevator lifts those who do not prefer climbing three flights of stairs. There is a suite of rooms, the front one, on Sutter street, being about 20 feet square and having sun most of the day; while the other, which can be shut off for committee meetings, etc., by ground-glass folding doors, is a trifle deeper and amply lighted from the hall. With woodwork stained a ruddy brown, marble fireplace, handsome carpet, black walnut chairs and tables and well-stocked bookcases—all fresh and commodious—the new headquarters of the State Board is a pleasant place for horticulturists to visit when in the city. The next meeting of the State Horticultural Society is to be held there on the 26th instant.

HON. HENRY VROOMAN has accepted an invitation to deliver the annual address before the Sonoma Co. Agricultural Park Association.

THE wild blackberry crop in Oregon is phenomenally large.

Spraying for Scale Insects.

California can claim credit for some of the greatest efforts at insect killing, whether judged by the ingenuity of the manner or the extent of the application. The engraving on this page, which is reproduced from Prof. Riley's forthcoming report, shows the arrangement used by some of our Southern California orange-growers for applying a spray to all parts of high and densely foliated trees. As the engraving shows, the tank of liquid is drawn in a wagon, and upon the wagon is fixed the force-pump which drives the material into the hose. This pump is operated by the driver of the wagon, while others manipulate the hose. The ingeniously contrived ladders on wheels are quickly put in place and enable the operator to approach the tree from any point upon its exterior.

Prof. Riley in his report will take issue to a certain extent with the California method of spraying. He thinks our way is wasteful and less effective than that common in Florida, and that to this fact is owing the partial lack of success attained with the kerosene emulsions which he recommends. To show this point and at the same time to introduce a new formula which Prof. Riley now commends for the first time, we make the following extract from his forthcoming report:

The essence of successful spraying of the kerosene emulsion consists in forcing it as a mist from the heart of the tree first and then from the periphery, allowing as little as possible to fall to the ground and permitting each spray particle to adhere. It is best done in the cool of the day, and where possible in calm and cloudy weather. With one fifth of the time and material now expended in California the spraying should be successfully done, so that three sprayings at proper intervals will be cheaper and far more satisfactory than only one as ordinarily conducted.

Without going into details as to reasons, we would therefore recommend the addition to every 50 gallons of the kerosene-soap wash, made after the usual formula, three ozs. of arsenious acid. Though the arsenical preparations are mainly effective against mandibulate insects, by poisoning through the stomach, they have also more or less effect by contact, and we are strongly of the opinion (which we hope soon to verify) that this combination, for the first time recommended, will give the spray more lasting effect, and that the few insects which escape the direct spray will be destroyed as they subsequently leave their protecting retreats or hatch from eggs and crawl about the tree. As a means of arresting the growth of the black-mold (which is, however, only the indirect consequence of the Coccid), so troublesome an accompaniment of the *Icerya*, a small proportion of sulphate of copper might also be added.

Just as there is now a great wastage of time and material in drenching a tree, so the spraying nozzle most in vogue in California is also wasteful. That most commonly used is the San Jose nozzle, in which the water is simply forced through a slightly flaring terminal slit in a more or less direct and copious jet.

The Cyclone nozzle has not yet had proper trial to impress its advantages, having scarcely been known prior to the experiments of Messrs. Coquillet and Koebel. That made and sold by G. N. Milco is patented in size and aperture after that which we designed to spray from near the surface of the ground. What is wanted for an orange grove or for trees is a bunch of nozzles of twice the ordinary size and capacity, the size of the outlet to be regulated by the force of the pump. There is no form of nozzle so simple and so easily adjustable to all purposes. We strongly recommend a bunch of four nozzles of twice the ordinary size and thickness—one arranged so as to have the outlet distally or at one end of the piping (which may be ordinary gas pipe) and the other three on branches, so that the outlet is at right angles, each about an inch below the other, and so placed that they are separated by one-third the

circumference of the main pipe. Such a bunch, with apertures properly adjusted to the occasion, worked from the center of the tree, will envelop it in a perfect ball of floating mist, which in a very short time will imbue all accessible parts. For tall trees a more forcible direct spray might be sent from the end by substituting an ordinary jet and the wire extension, which is simply an extension tube screwed over the nipple, the end of the tube being covered with wire netting, which breaks up the liquid forced through it, and which, for force and fine division of the particles, has some advantages over the San Jose nozzle. Finally, if a series of blind caps and several sets of caps of varying aperture are kept on hand, the spray may be adjusted at will, and to suit the conditions of wind, pump force, etc., that have to be dealt with.

We hope some experiments will be made to test the success of this suggestion of Prof. Riley as compared with prevailing methods here.

Reading the Thermometer.

Reports specifying the thermometer as standing so many "degrees in the shade" are often misleading so far as a fair test of the temperature is concerned. The mercury in a thermometer hanging on a porch or near a window upon which the sun shines will often indicate eight or ten degrees higher temperature than if it

The Mechanics' Fair.

Preparations are going forward with vigor for the coming fair of the Mechanics' Institute. Extensive improvements and rearrangements are going on in the Pavilion which we will describe more fully when they are more nearly completed. Suffice it to say that the Pavilion will be much larger and promises to be proportionally handsomer than ever before.

We desire at this time to present some points as to what several of our most enterprising counties are doing in preparation for the contests for the county awards. Of course all efforts do not always reach anticipated results, but we trust that the anticipations in these cases may be fully realized, and that mention of them may lead many others to enter the lists for the purpose of securing a creditable and representative display of State products.

The counties expected to make the most noticeable exhibits are Santa Clara, Sonoma, San Mateo, Placer, Napa (especially in the variety and number of the exhibits of wines), Contra Costa, Kern, Fresno and Humboldt. The exhibit from Humboldt will contain fruits that are out of season with us. Mr. John Vance of Eureka will send one of the largest redwood logs ever seen. The Board of Super-

intendent exhibitors from San Mateo will be W. H. Dimond, M. J. Brittain, John T. Doyle, Chas. N. Felton and Sam Jones.

Placer county as usual expects to carry off the first premiums, but will have more powerful competitors than ever before. Contra Costa is in charge of the Board of Trade of that county. They have had space assigned to them, and expect to astonish the natives.

The Fresno county committee has done good work; their exhibit is largely of dried fruits from the ranch of C. T. White, who has just planted one of the largest raisin vineyards in the State. It is one mile square, and he expects it will cost him \$200,000 before he receives a single cent from it.

Napa exhibit is in charge of H. W. Crabb, Fred Beringer, Chancellor Hartson, W. W. Lyman, H. A. Pellet, and Tubercio Parrott. Mr. M. M. Estee is largely interested in aiding the exhibit, and is to furnish a carload of foliage plants, orange tree in full bloom, etc. They promise unusually attractive features about which they are reticent, as they desire to create a sensation.

Sonoma county is under the charge of E. P. Overton. Among those prominent in Sonoma county are Wm. D. Sink of Cloverdale; W. N. Gladden of Healdsburg and Jno. Adams of Santa Rosa; Isaac D. Turk of that county and G. N. Whittaker of Santa Rosa. Pomona Grange will also have a fine exhibit.

All the northern counties like Sonoma, Mendocino and those lying along the line of the Donahue R. R., have been largely promoted by the R. R. Co., which gives free transportation to all exhibits. They have been extremely liberal in affording facilities to the Institute itself for distribution of circulars, etc., and transportation of agents. Col. Donahue is chairman of the Finance Committee of the citizens of San Francisco.

W. W. Boughton of the Lompoc Record will have charge of the Santa Barbara county exhibit, assisted by a committee, and will have a fine exhibit. San Luis Obispo is reported to be taking especial pains with its exhibit.

Wm. T. Coleman, one of the largest exporters of California fruits, will make a large display.

The system this year is to have large aisles and no blind alleys, so as to give plenty of room for visitors. The entire garden is to be devoted to county exhibits, as also is the entire space 30 feet wide running parallel and nearest it, while the south side of the building is to be devoted also to the county exhibits. Napa county takes up 140 feet of running wall space easterly. Placer county takes up the western side entirely. Santa Clara, San Mateo, Sonoma valley, Kern and Contra Costa counties are on the main floor nearest the garden. San Mateo has in addition one of the central spaces.

The fair will open on Saturday, the 1st of September, and close on Thursday, the 8th of October. As stated above, we will make mention of other leading features of the fair at another time.

THE INDIANA STATE FAIR is to come off at Indianapolis, September 19th and 24th, when the management expects to be prepared to show somewhat of the wonderful progress made in the various industrial arts and specimens of the best breeds of domestic animals in North America. We are pleased to acknowledge the receipt of a special ticket from the secretary of the Indiana State Board of Agriculture.

The canneries are short of hands.

CALIFORNIA METHOD OF SPRAYING ORANGE TREES TO KILL INSECTS.

were hanging where the heat of the sun was not reflected upon it. For this reason reports of extreme heat are often exaggerated. The mere fact of the thermometer being in the shade does not go to show that the average temperature is indicated.

The different degrees of heat, in their effect upon the animal system, also vary very much, according to the amount of moisture which may exist in the atmosphere at the place or time of observation. When the atmosphere is very dry a much higher degree of temperature can be sustained without inconvenience than when it contains an unusual amount of moisture. The degree of heat under the effect of which so many persons have lost their lives at the East during the last few weeks, where the air is very moist, would not have seriously affected any one in this State, where the atmosphere in the summer is always exceptionally dry. Sunstroke in California is a thing almost unknown, although the thermometer often stands many degrees higher than in places at the East where sunstroke is a common occurrence every year.

HIGH-GRADE ANIMALS FREE OF DUTY.—The Treasury Department has decided that animals of high grade and value, imported from distant countries for breeding purposes, are entitled to free entry, notwithstanding the fact that they may be for sale.

EL DORADO COUNTY FOLKS are promised the pleasure and profit of hearing John P. Irish, the gifted editor and speaker, at the Placerville fair.

visors of that county 'made an appropriation to aid the exhibit of that county.

One of the most noticeable exhibits in the line of agricultural products and wines, fruits of every variety, vegetables, etc., will be exhibited from the old valleys of Sonoma and Guilcos by the Sonoma Valley Association. It is largely gotten up by Capt. J. H. Drummond of Glen Ellen. He sent to almost every civilized portion of the world to obtain seeds, Hungary, Italy, Spain, Scotland, Portugal, etc., and has succeeded in obtaining some most astonishing results. Their display is to be supplemented by a unique floral exhibit and by a display of preserved fruits, the white glass bottles for which were brought from the East; also a large display of domestic articles.

Santa Clara exhibit has the Mayor of San Jose at the head. Mrs. Watkins will have charge of some portions of it, and for the floral display the nurseries of R. D. Fox and John Rock are to be largely drawn on. The Boards of Trade of San Jose, Los Gatos, Gilroy, Santa Clara, and the Saratoga Improvement Association have aided in getting up the display. Henry T. Phelps is president and W. T. Adel secretary. Hon. C. T. Ryland has also taken great interest in the effort.

The San Mateo exhibit is in charge of the San Mateo Development Association. Timothy Guy Phelps is president. The committee is largely composed of some of the wealthiest business men in San Francisco who have estates there. H. P. Boyce's show of palms and other plants is said to be remarkable. Among prom-

California Inventors

Should consult **DEWEY & CO.** AMERICAN AND FOREIGN PATENT SOLICITORS, for obtaining Patents and Caveats. Established in 1860. Their long experience as journalists and large practice as Patent attorneys enables them to offer Pacific Coast Inventors for better service than they can obtain elsewhere. Send for free circulars of information. Office of the MINING AND SCIENTIFIC PRESS and PACIFIC RURAL PRESS, No. 220 Market St., San Francisco Elevator, 12 Front St.

H. M. NEWHALL & CO.,
SHIPPING AND COMMISSION MERCHANTS,
309 and 311 Sansome Street, San Francisco, Cal.

Agents for Growers and Manufacturers. Charterers of Vessels for all Trades. Agents for the Mexican Phosphate and Sulphur Company's Products. General Insurance Agents.

Have correspondents in all the chief cities of the United States, Europe, Australia, India, China and the principal islands of the Pacific. Purchase goods and sell California products in those countries.

General Agents for the Pacific Coast of **NATIONAL ASSURANCE CO.**, of Ireland; **ATLAS ASSURANCE CO.**, of London; **BOYLSTON INSURANCE CO.**, of Boston, Mass.

Santa Clara Valley Agricultural Society

WILL HOLD THEIR
ANNUAL FAIR AND SPEED CONTESTS.
Commencing on Monday, Aug. 15th and Ending Saturday, Aug. 20th,
—AT—
SAN JOSE.

There will be a Large Exhibition of Live Stock and Agricultural Machinery.

INTERESTING SPEED CONTESTS ON EACH DAY OF THE WEEK.

A Balloon Ascension by Prof. **VAN TASSELL**, who will drop when one mile from the earth by a Parachute.

N. B. EDWARDS, President. **G. H. BRAGG**, Secretary.

TWENTY-SECOND INDUSTRIAL EXHIBITION AND MECHANICS' FAIR.
SAN FRANCISCO, 1887.
Opens September 1st, closes October 8th

The Trustees of the Mechanics' Institute take pleasure in announcing that the coming Exposition promises to be the most attractive and important to the producers of this State of any yet given.

Several Counties have already applied for space to make a general exhibit of their resources, and it is now an assured fact that the whole of the immense pavilion, with its annexes, will be filled with California's choicest productions, both natural and manufactured.

An Orchestra of 50 celebrated soloists and musicians, under the leadership of the celebrated Trombone Virtuoso, Fred N. Innes, has been engaged, and will perform each afternoon and evening.

The immense Art Galleries will be filled with choice works of Painting and Sculpture; the Machinery Hall and the Agricultural Machinery and Implement Department will contain the best and latest inventions in mechanic art.

Intending Exhibitors should lose no time in applying for Space.

Liberal Premiums in Each Class will be Awarded.

No Charge for Space, Steam or Power.

PRICES OF ADMISSION—Double Season Ticket, \$5; Single Season Ticket, \$3; Adult's Single Admission, 50 Cents; Children's Single Admission, 25 Cents.

Season tickets to members of the Institute at half price.

Full information given or sent on application to the office, 31 Post Street.

A. W. STARBIRD, Secretary. **P. B. CORNWALL**, President.

AMERICAN EXCHANGE HOTEL,
319 & 321 Sansome St., San Francisco.
One door from Bank of California.

The above well-known hotel offers superior accommodations to parties visiting the city.

The table is kept at top grade and the prices are within the reach of all.

RATES—\$1.00, \$1.25 and \$1.50 per day
Free Coach to and from the Hotel.

CHAS. & WM. MONTGOMERY, Prop'rs.

CHICAGO VETERINARY COLLEGE
INCORPORATED 1883.

Facilities for teaching and clinical advantages unsurpassed. Regular winter session for 1887-1888 commences October 1st. For prospectus and further information, address the Secretary.

Lands For Sale and To Let.

ANDERSON, LAINE & CO.,
Real Estate,
LOAN AND INSURANCE OFFICE,
ROOMS 9 and 10 MARTIN BLOCK,
North First St., SAN JOSE, CAL.

A large list of orchard and fruit lands and suburban homes in Santa Clara Valley and rural retreats in the celebrated warm belt. Correspondence solicited

Glen Cove Rancho for Sale.

This Rancho is situated at tide-water on the north shore of the Straits of Carquinez in Solano County, and comprises about 415 acres of good grain land. It is fenced and cross-fenced with five-board fence, and is well calculated for fruit raising. Has a young orchard of upward of 700 trees now well started; also a vineyard of 7000 vines of wine-producing grapes. The improvements consist of a large barn covering an area of 30x60, with 15-foot stables on either side; also a warehouse 30x60 for storing grain (with wharf) at tide-water, thus saving the expense of hauling grain for shipment. A wagon-house, a conservatory, sheds for storing machinery, hen-houses and inclosed yards, with a modern-built, two-story house with mansard roof and cellar under the whole structure, resting on an 18-inch stone wall; has 16 large, fine rooms, hard-finished walls, furnished with hot and cold water from two large cisterns and a spring upward of 100 feet above the house. Has a fine garden and pleasant surroundings; is about 30 miles from San Francisco and four miles from Vallejo or Benicia, with good roads by land and a pleasant sail by water. The prospective railroad from Santa Rosa to Benicia is expected to pass directly in front of the place, and a flag station is promised by said railroad company. The soil is of a rich loam and very deep. In point of health and climate no section of the State can surpass it. The live-stock and the farming implements will be sold, if desired, at very low figures. A rare opportunity is offered for any one who wants a very desirable place at a very favorable price. For further particulars apply on the premises or address, **JOHN F. DEMING**, Vallejo, Solano Co., Cal.

WEST COAST LAND CO.
TEMPLETON, SAN LUIS OBISPO CO., CAL.

Home of Wheat, Fruit, Wine and Olive; 15,000 acres sold in past 8 months to 220 settlers, representing a population of 1100; 49,000 acres—small subdivisions—average, \$22 50 an acre; 1/2 cash, balance 5 years, 6 per cent. Catalogues and maps free. **C. H. PHILLIPS**, Manager.

REAL ESTATE FOR SALE.

Edwin K. Alsip & Co.
(Established 1860)

Have the largest list of Farm property in Northern and Central California. Catalogue issued monthly. Send or call for it. **SACRAMENTO, CAL.**

Branch Office—640 Market St., San Francisco.

A NEW COLONY

On the new extension of Southern Pacific Railroads, on the lands belonging to R. T. BUELL, Esq., near Los Alamos, Santa Barbara county, Cal. Parties desiring to visit the property now, can go via San Luis Obispo and take the cars from thence to Los Alamos, thence by stage to the Colony. 20,000 acres of the best lands in California, subdivided into 20, 40 and 80-acre farms; \$20 to \$30 per acre. **INTERNATIONAL IMMIGRANT UNION**, 401 California St., San Francisco

S. F. MARKET REPORT

NOTE.—Our quotations are for Wednesday, not Saturday, the date the paper bears.

Weekly Market Review.

DOMESTIC PRODUCE, ETC.

SAN FRANCISCO, August 3, 1887.
Delightful weather the past week has aided no little in harvest-work; the only objection has been that fruits matured too rapidly, necessitating sending them in more rapidly than the market was prepared to care for, which sent prices down. In wheat, the East has had a steadier tone, while in Europe the market ruled fairly steady. To-day's London cable is as follows:

LIVERPOOL, Aug. 3.—Wheat neglected. Cal. spot lots, 6s 10d to 7s 1d; cargoes off coast, quiet; on passage, buyers hold off; Mark Lane wheat, quiet; Wheat on passage to Continent, 480,000 qrs; wheat and flour to U. K., 1,872,000 qrs.

Foreign Review.

LONDON, Aug. 1.—The *Mark Lane Express* in its weekly review of the British grain trade, says: "The harvesting of wheat is becoming general. A large proportion of the oat crop is already cut. Values are tending downward. The crops being reaped are in good milling condition, and prices are expected to be lower than ever. The rates for foreign wheat are all in buyers' favor. Liverpool has recorded a decline in spot wheat every market day. Rye is very much depressed. Corn weaker. Barley is lifeless. Linseed is 3d better."

Eastern Wheat Markets.

NEW YORK, August 3.—12 M.—80½¢ for cash, 78½¢ for Aug., 80½¢ for Sept., 81½¢@81¾¢ for Oct.

CHICAGO, August 3.—12 M.—68½¢ for cash, 68½¢ for Aug., 70¢ for Sept., 71¾¢ for Oct.

California Fruit in Chicago.

CHICAGO, July 31.—A carload of peaches, raised near San Jose, and averaging 3½ inches in diameter, arrived yesterday and sold for \$4 and \$4.50 per box.

CHICAGO, August 2.—Several carloads of California fruit arrived to-day. Peaches had suffered somewhat from the heat. The late Crawford's were in finer condition than were the early varieties, the latter selling at \$1.25 per box, and the former at \$1.50@1.75. Orange clings brought \$1.25@1.50 per box. There was a good demand shown for all the fruit offered. The following quotations ruled to-day: Columbia plums, \$1.50; German and Gros plums, \$1.50@1.75; Bartlett pears, \$2.25@2.75; Burren Hardy pears, \$2.25@2.50; nectarines, \$1; Sweetwater grapes, \$1.25; Rose de Peru grapes, \$1@1.25.

California Dried Fruit.—There are no arrivals of new fruit, excepting apricots. A fair demand exists. Plums are inquired for, but there are no offerings. Raisins rule quiet at former prices. Pitted plums, evaporated, 10¢@11¢; do, sun-dried, 10¢@10½¢; apricots, evaporated, future delivery, 14¢; cash, 15¢@16¢; prunes, 10¢@11¢; raisins, London layers, 20 lbs boxes, \$1.30@1.40; do, 10 lbs boxes, \$1.15@1.25; California layers, \$1.15@1.25.

California Products at New York.

NEW YORK, July 30.—Mustard continues in demand and firm. California yellow in a large way might be obtained at 4¢, but for small lots, 4½¢@4¾¢ is demanded.

NEW YORK, August 1.—Two carloads shipped by the California Fruit Union, July 23, met with an accident on the way, and did not arrive until nearly midnight on July 30. The fruit had to lie sweating until this morning. Two more carloads came in time to be sold this forenoon. Altogether, 2997 boxes were sold at the following prices: Bartlett pears, 400 boxes at \$1.95@2.15 per box; peaches, 2400 half-crates at 45¢ to \$1.50; plums, 162 half-crates at 60¢ to \$2.95; grapes, 35 half-crates at 75¢ to \$1.30. The prices obtained were quite satisfactory, as the damaged fruit was hard to dispose of at any price.

Eastern Wool Markets.

NEW YORK, July 31.—Business the past week has been confined to a very few houses, and the majority have been able to sell only small quantities. Sales foot up 2,132,600 lbs of all kinds—an increase over the sales reported during the previous two weeks, but considerably below the record of last year. The quotation of Calif. spring is 19¢@22¢; Calif. fall, 12¢@18¢; Oregon, 22¢@25¢; and ordinary Texan and Territory, 19¢@22¢. Among the sales noted were 20,000 lbs fall Calif., 12¢@15¢; 12,000 lbs fine merchantable, 25¢@28¢; 5000 lbs fine unwashed, 22¢; 25,000 lbs No. 1 medium, 29¢@30¢; 10,000 lbs, 32¢; 20,000 lbs scoured Calif., 55¢; 20,000 lbs Oregon, 22¢@23¢.

The Philadelphia market is without important changes. Among the sales were 40,000 lbs unwashed, fine and medium Territory, 20¢@22¢; 57,000 lbs fine Territory, 19¢@22¢.

The Boston market is unchanged. Among sales were 125,000 lbs Calif. spring, 20¢; 78,000 lbs Calif. fall, 12¢@16¢; 73,500 lbs Territory, 18¢@27¢.

New York Hop Market.

NEW YORK, July 31.—Really choice Pacifics seem very scarce. Medium and poor goods are difficult to move, even at comparatively low prices. Coast crop 1886, best, 18¢@20¢; same, common to good, 15¢@17¢; 1885, good to prime, 9¢@12¢.

Local Markets.

BAGS.—The market is quiet, but steady.

WHEAT.—The market for options ruled strong on Call Board, up to Tuesday, when it eased off. Many farmers sold, delivered their grain and got their pay at the high prices. It is claimed that fully 100,000 tons of No. 1 white shipping changed hands at good figures up to to-day, when William Dresbach, who had been running the corner, gave notice that he could not meet his engagements. The Produce Exchange adjourned on receipt of this information, and consequently no business was done. Particulars of the proposition in settlement offered by Dresbach are given elsewhere. For sample wheat no quotations are obtainable, and will not be until the wheat-deal collapse is settled. The quotations we give are entirely nominal and what is likely to be if Dresbach's creditors accept his proposition.

BARLEY.—The market held weak up to Monday, when it was firmer. To-day there was no business, owing to the collapse of the wheat deal and the unsettled condition of affairs. The price of barley has

been hammered so low that many large operators have confidence in it and are buying freely.

BUTTER.—The market is stronger and quick at full prices. As high as 30 cts @ lb was paid by the single box for gilt-edged. The drouth at the West is creating higher prices at Chicago and other large western centers.

CHEESE.—The market is strong, at a slight advance in sympathy with butter and also a higher market at the East. The latter is caused by the drouth.

EGGS.—The market for strictly choice continues very strong under a good demand. Off grades are slow.

FLOUR.—The market is strong under light supplies.

[COMMUNICATED.]
Market Information.

Cereals.

When the Produce Exchange met this morning, William Dresbach, who has been running the wheat corner, notified the directors that he could not meet his engagements and made the following proposition in settlement: He to put 10,000 tons of paid-up wheat in the warehouse in the directors' name as security to the faithful carrying out of the following proposition, if accepted by his creditors: All sellers to him of buyer and seller options to be paid, as fast as the wheat is delivered, in cash, the difference between the price to which wheat was margined and \$1.70. The wheat delivered is to remain in the warehouse in the seller's name until the price \$1.70 is paid in four equal monthly payments. If this is accepted, then it is quite evident that No. 1 white shipping wheat will not go much, if any, below \$1.70, for the short sellers will be in the market for wheat, or else lose the money they put up to keep their margins good. A meeting of the creditors is called for this afternoon, and it is likely they will accept the proposition rather than lose the money which they have already put up.

Dornbusch's London grain circular, July 15, reports as follows: There is no "sound of abundance of rain" in the United Kingdom; the earth has become like iron, and the spring corn and pastures, especially on light lands, have suffered considerably from the protracted drouth. The bean crop is being injured by insects, and peas with little exception will probably turn out badly. On the other hand the wheat, barley and oats on heavy well-farmed land are very promising, especially the former, which stands well and will keep so, unless heavy rains come to lay the crops. In France some rain has fallen, but not enough to counteract the effects of the long spell of dry weather. In Belgium and Holland the crops are promising, and Germany, with lower temperature and moisture in the North, anticipates a favorable harvest.

Exports of wheat from India for the week ending July 23 were 500,000 bu., of which 380,000 bu. were to the United Kingdom and 120,000 bu. to the Continent. The total shipments from January 1 to July 23 were 22,260,000 bu. of which 11,000,000 bu. were to the United Kingdom and 11,260,000 bu. to the Continent.

Stocks of flour in Paris on July 1, reported at 467,000 bbls, against 503,000 bbls one year ago.

Area devoted to wheat in Manitoba this year is reported at 432,134 acres, against 384,441 acres in 1886.

The Chicago *Trade Bulletin*, just to hand, says that some damage to small grain, by insects has been reported in some sections in the Northwest, while dry and hot weather has checked the growth of corn in the West and Southwest. Yet the increased acreage of farm-land in the West which has been developed within the past year, will tend to partially offset any damage inflicted by insects or unfavorable weather, and the general opinion is that so far nothing discouraging has been manifested, which will bring the aggregate of all the crops below an average.

Private advices report that owing to the very light hay crop and the low price of corn, many fields of corn are being cut for feed.

The stocks of wheat and flour in France are small, and the domestic reserves of wheat in growers' hands are very light.

A large portion of the winter wheat crop of the United States has been harvested. The indications are, from the reports received, that the output will be at least 35,000,000 to 40,000,000 bu. less than in 1886, or about 270,000,000 bu. The acreage this year is 2 per cent less than last year. The spring wheat crop of 1887 has an area 6 per cent larger than in 1886. The output last year was about 146,000,000 bushels. The crop in parts of Iowa, southern Minnesota and Dakota, has been damaged from drouth, chinchbugs and fly. Indications now are that the output will not exceed 140,000,000 bu.

On this coast the bulk of harvesting is finished. Farmers' deliveries are in consequence increasing. The quality of the grain in Washington Territory and Oregon is superior to last year. The yield to the acre is also more. In this State the grain is very irregular, as was the yield. The bulk of the wheat is inferior, while the bulk of the barley is nothing to boast of if the samples sent to this market are a fair representation.

The stock of wheat in this city and at Port Costa, on August 1, was 131,939 tons, an increase for the month of 19,405 tons.

Receipts of barley last month are reported by the Produce Exchange to have been 10,380 tons, but other authorities make it about 12,000 tons. Although receipts were so large still the stock on August 1 was only 3948 tons larger than on July 1. This shows for this city a very large consumption—larger than ever before known. Owing to the high price of ground feed and hay, more ground or rolled barley is going into consumption. Barley ruled weak at low prices up to Monday, when a stronger tone set in. Although the daily papers quoted No. 1 feed below 1¢, yet at no time could it be bought even at less than \$1.01¼ per cental, and seldom at that low. There is a large increased call for brewing grades of barley, both for home and shipping to New York.

Heavy receipts of oats cause a weak market at lower prices. The demand at the lower prices appears to be increasing.

Corn is very strong and hard to get except at an advance, in sympathy with a higher market at the East, where the crop is said to be damaged by drouth.

The Cincinnati *Price Current*, July 28, reports

as follows: The past week has afforded some relief to suffering cornfields by rains in many districts of the West, but there is a very considerable breadth of grain in Ohio, Indiana and Illinois, especially in the southern portions of these States, still very much in need of rain to assure anything like a good crop. West of the Mississippi, corn in Iowa, Missouri and Nebraska is generally in good condition, and this is to be said of much of Kansas, but in the latter State the conditions are not so uniformly favorable. Take it all in all, a large portion of the corn crop of the West is now in a critical condition, and notwithstanding the fact that this grain can withstand much of dry weather, following a good start in growth, the point has been reached when relief must be had from rains very quickly over a large breadth of the corn belt or the yield will be most seriously cut short. The dry weather has cut short pasturage to a large extent and hastened the marketing of stock, and has curtailed the yield of various crops more or less, including oats, potatoes, hay, etc.

Feedstuff.

Receipts of bran from Oregon are increasing, but still they are light. The market for both bran and middlings is strong.

Rolled barley continues to gain in favor, owing to its relative cheapness. The consumption is very large.

Hay rules very firm at full prices. The consumption is quite large, fully one-quarter more than last year at this time. Owing to high water the Oregon crop is short, while the drouth West made a short crop there.

Live-Stock.

Both beef cattle and mutton sheep rule low. The continued low price is a disappointment to butchers, who expected a higher range of values. The condition of the stock sold is good, fully up to last year, when there was better pasturage. Veals are firm. Hogs are weak and lower, under free offerings. It is thought they will go still lower, if the selling pressure continues.

In horses there is nothing new to report. There is a continued good inquiry for general utility horses and also roadsters. Work horses meet with only a fair inquiry.

The following are the wholesale rates of slaughterers to butchers:

BEEF—Extra, 7¢@7¼¢; first grade, grass fed, 6½¢@7¢ per lb.; second grade, 6¢; third grade, 4½¢@5½¢.

MUTTON—Ewes, 5¢@5½¢; wethers, 6¢@—c.

LAMB—Spring, 7¢@8¢.

VEAL—Large, 6¢@7¢; small, 6¢@8¢.

PORK—Live hogs, 4½¢@4¾¢ for heavy and medium; hard dressed, 7¢@7¼¢ per lb.; light, 4½¢@4¾¢; dressed, 7¢@7¼¢; soft hogs, live, 3½¢@4¢. On foot, one-third less for grain or stall fed, and one-half less for stock running out.

Fruits.

The market has been glutted the past week with all kinds of seasonal fruits, causing extreme low prices to rule for peaches, plums and apricots. Canners bought liberally, but receipts were greatly in excess even of their increased requirements. It appears as if everything ripened at once. Dealers had to clean up consignments even at a less figure than quoted. Berries were also in liberal supply, and claimed attention from canners—cool weather had much to do against the demand. Many consignments of fruits were received too ripe, and had to be placed for what they could bring.

Apples are in liberal supply. The market favors buyers.

Grapes are coming in freely, with the better varieties in good supply. Advices from the different grape-growing sections are conflicting, but the general tenor of reports is to effect that the yield will be larger than last year, owing to more vines bearing. Wineries are running in some sections.

Dried apricots continued to come forward freely, but owing to the continued good inquiry, concessions on asking prices are hard to get. The quality this year is better than last year. Peaches are coming in, but as yet they are poor and do not command attention. Choice are wanted, and will fetch full figures. Dried figs are selling for less money. The East reports a good demand for California dried fruits.

Seed.

Advices from Western Idaho and Eastern Washington Territory report a good yield of flaxseed. Eastern advices report that the crop of flaxseed will be much smaller than last year. The reason for this is reduced acreage, and in some sections dry weather. It is a well-known fact that flax exhausts the vitality of the ground more than any other crop—not more than three consecutive crops can be raised successfully. This partially accounts for the reduced acreage. Less new ground was sold to flax this year. The quality of the crop is good.

The crop of timothy at the West is considerably below an average.

Vegetables.

The drouth at the West is reported to have very materially reduced the crop of cabbages; in consequence high prices are looked for, with a free call on this coast for supplies.

In seasonable vegetables the market is liberally supplied, with prices largely in buyers' favor. Tomatoes are being taken by canners, while picklers are taking pickling onions and cucumbers.

Potatoes continue to come in freely. The crop in Oregon will be below an average, owing to the bottom lands having been flooded. In this State the crop is more than an average and of superior quality. As the crop at the West will be short, it is stated that our market will improve later on this year.

Miscellaneous.

The tonnage movement compares with last year at this date as follows:

	1887.	1886.
On the way.....	300,286	323,571
In port, disengaged.....	74,731	31,961
In port, engaged.....	40,259	39,101
Totals.....	415,276	394,633

The above gives a carrying capacity as follows: 1887, 659,740 short tons; 1886, 631,412 short tons; increase over last year, 28,328.

Honey is very stiff under light supplies, short crops at the East and a good demand.

Wool, unless medium to fine, is slow to place. The assortment is poor, and sales are few in consequence.

Dealers in hops are still engaged in the pleasing, to them, task of talking the market down. Owing

to the warm weather at the East and in Europe, the consumption is larger. Crops abroad have improved, but still are less than average. New York advices are of the same tenor heretofore noted.

Poultry ruled fairly steady throughout the week. Large, good-conditioned fowls have ready sales at a slight advance on outside quotations, but poor are hard to place.

San Francisco, August 3, 1887.

SCALDS and BURNS
Should have prompt and proper care or they may prove very dangerous and perhaps FATAL.

are constantly happening. A kick of a horse or cow may cause a bad bruise; the slip of an axe or knife may result in a serious cut.

Any of these things may happen to one of your family at any moment. Have you a bottle of **PERRY DAVIS' PAIN KILLER** ready for use in such cases? It has no equal for the cure of Scalds, burns, cuts, swellings, bruises, sprains, sores, insect bites &c.—All Druggists sell it.

Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. Look CAREFULLY AT THE LABEL ON YOUR PAPER.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in DEWEY & Co.'s Patent Office Library, 220 Market St., S. F.

FOR THE WEEK ENDING JULY 26, 1887.

367,127.—OIL-PRESS MAT—G. S. Andres, S. F.	367,177.—ROTARY ENGINE—Geo. Barr, La Center, W. T.	367,086.—CABLE PROPULSION FOR RAILWAYS—R. F. Bridwell, S. --	--	--	---	--	---	---	--	---	--	--	--

NOTE.—Copies of U. S. and Foreign patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates, and in the shortest possible time.

It was an old oriental doctrine that women have no souls. More enlightened philosophy concedes that they have purer, finer, more exalted souls than men. But they are too often contained in feeble, suffering bodies, which hamper and retard their full development. For all those painful ailments incident to the sex, Dr. Pierce's "Favorite Prescription" is the best specific in the world, and is sold under a positive guarantee that it will do all that is claimed for it. Price reduced to one dollar. By druggists.

Do Not Be Alarmed

At the raising of blood from the lungs. It is one of the very earliest symptoms of consumption, and only shows the healthy efforts of the system to throw off the scrofulous impurities of the blood which have resulted in ulceration of the lungs. Dr. Pierce's "Golden Medical Discovery" is a positive remedy for consumption at this stage. If taken faithfully, it will cleanse the blood, heal the ulcers in the lungs, and build up and renovate the whole system.

Walking advertisements for Dr. Sage's Catarrh Remedy are the thousands it has cured.

Sale of Thoroughbreds.

Owing to the sale to Senator Stanford of the land at Menlo Park, used by F. H. Burke as a stock ranch, Mr. Burke has decided to dispose of his thoroughbred stock by auction. The horses will be sold by Killip & Co. next Tuesday, at Rogers' stable, 1606 Market street, this city. The catalogue contains 24 numbers. The sale of thoroughbred cattle, sheep and hogs will take place at Sacramento during the State Fair.

Consumption Cured.

An old physician, retired from practice, having had placed in his hands by an East India missionary the formula of a simple vegetable remedy for the speedy and permanent cure of Consumption, Bronchitis, Catarrh, Asthma and all throat and lung affections, also a positive and radical cure for Nervous Debility and all Nervous Complaints, after having tested its wonderful curative powers in thousands of cases, has felt it his duty to make it known to his suffering fellows. Actuated by this motive and a desire to relieve human suffering, I will send, free of charge, to all who desire it, this recipe, in German, French, or English, with full directions for preparing and using. Sent by mail by addressing with stamp, naming this paper, W. A. NOYES, 149 Powers' Block, Rochester, N. Y.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

MERY'S IMPROVED PIONEER

BARLEY CRUSHER

Using the Benoit Corrugated Rollers.

STILL AT THE FRONT.

This Mill has been in use on this Coast for 6 years.

TAKEN THE PREMIUM AT THE STATE FAIR

Four years in succession, and has met with general favor, there now being

Over 200 of them in use in California, Nevada & Oregon

It is the most economical and durable Feed Mill in use. I am sole manufacturer of the Corrugated Roller Mill. The Mills are all ready to mount on wagons.

GRAINLAND,

BUTTE CO., CAL., June 9, 1887.

Mr. M. L. Mery—DEAR SIR: We have used one No. 2 Roller Barley Crusher now for eight years and have used it steady during that time; have crushed 45 tons a day, and the crusher is as good to-day as when it came out of your shop. I am satisfied that it is the best mill made. You may reconstruct this testimonial to the best advantage for you and sign our names, for you cannot overrate the merits of your mill.

F. E. REAM,

JOHN P. SUTTON.

DURHAM, May 21, 1887.

Mr. M. L. Mery—DEAR SIR: In reply to yours of the 19th, would say that I crushed from two to two and a half tons per hour, but could crush three and a half tons per hour if my elevators were large enough to carry the barley from the machine. The No. 1 machine I used at Gridley was run on a sack a minute, but if we got behind we could run through five tons an hour, and do good work. The machine I use here is a No. 2.

Yours, WM. M. TAYLOR.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

M. L. MERY,
CHICO IRON WORKS,
CHICO, CAL.

Wilson's Vaporizing Inhaler,

MEDICATED INHALATIONS.

The Only Successful Home Treatment and a Positive Cure for

Catarrh, Asthma, Bronchitis, Deafness,

And all diseases of the head, throat and lungs. One test, one look will convince intelligent people that this is a rational and scientific treatment. It is the only advertised remedy endorsed by the medical profession. A hundred physicians and thousands of citizens are our references. Established in 1882. Children enjoy it. A household treasure. Lasts a lifetime. Cost, with medicine and prescriptions for duplicating same, only \$2.50; can be sent by express. Consultation and test free. Send for Circular. Office, 229 Kearny Street, San Francisco.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

Dr. J. KOEBE—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a Valuable Manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,

DR. E. A. SCHNEIDER.

University of California, College of Agriculture.
BERKELEY, Nov. 20, 1886.

Dr. J. KOEBE, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

H. M. NEWHALL & CO., Agents, 309 and 311 Sansome St., San Francisco.

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1/2 pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sbranto, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

ORANGE, LEMON & LIME TREES

FOR THE SEASON OF 1888.

RICHARDSON.

Among a host of competitors, many of which are excellent instruction books,

Richardson's New Method for the Pianoforte

Still serenely occupies the position of the "winning yacht" in the race for popularity. Its sale has been tremendous. Edition follows edition in rapid succession, and it will not be long before it will be safe to announce

A HALF MILLION COPIES

As the total number printed and sold.

"RICHARDSON" is a very correct book. For a long time, no error in a phrase or note has been recorded.

"RICHARDSON" has become a standard favorite with a multitude of teachers, who find an advantage in giving lessons from a book with which they are familiar, and that by its high reputation secures the respect and interest of the scholar.

"RICHARDSON" has advantages in the way of good illustrations of the position and action of the fingers, and also in the few pages of advice to players from the pens of Schumann and Czerny.

Mailed for the price, \$3 00.

HEADQUARTERS FOR ALL KINDS OF BALING PRESSES —AND— HAYING TOOLS.

THE MONARCH, JR., HAY PRESS.

IMPROVED FOR 1887.

Any young man can earn more on an investment of \$500 in this press than can be earned in expending \$2000 for any other machine. We have a Monarch Press, which we sell for \$600, but has been used a very little and is just as good as new, which we will sell for \$450.

THE CLIMAX HAY PRESS, \$300.

Weight, 2200 lbs. A crew of three men—four can be used to advantage.

Five ropes are used on the bales. Capacity, 10 to 15 tons per day. The best press for the money in the world.

The Celebrated Petaluma
BALING PRESS.

Weight, 2600 lbs. Price, \$350, delivered at the factory. Size of bale, 22x22x48 inches. Capacity, 26 tons per day. Weight of bale from 225 to 400 lbs. This remarkable machine still stands at the head of all vertical baling presses, and probably bales three-quarters of all the hay west of the Rocky Mountains.

Whitman's IMPROVED New Rebound Plunger.

GREATLY IMPROVED FOR 1887.

GUARANTEED SUPERIOR TO ANY LEVER PRESS

DO NOT CONFUND OUR NEW PRESS WITH THAT MADE TWO YEARS SINCE. EVERY PRESS FULLY WARRANTED. FOR ONE OR TWO HORSES. THE MOST POWERFUL IN USE. THE MOST RAPID AND DURABLE, AND THE MOST PERFECT. MAKES THE MOST PERFECT BALE. THE MOST SIMPLE TO OPERATE. LEAST EXPENSE FOR REPAIRS. NO STOPS FOR TYING BALE.

HOP PRESSES.

Send to us for circular, cuts, and prices of new hand-power Hop Press possessing the following advantages:

1. Perfect facilities for putting on the cloth, as the bale, after being pressed, is fully exposed at the sides and ends.
2. A good depth of box for a hand press (7 feet).
3. A perfectly tight and solid box with no slots or sliding pieces at the ends.
4. A press that presses downward so that bales come out at the bottom.
5. Powerful progressive leverage and the entire absence of cast iron racks (which are always liable to break and fail to give the required power at the pinch).
6. A balanced follower that goes up without assistance.
7. A press which lets the follower swing entirely out of the way when up so as to allow of easy feeding, and which has no overhead beams in the way.
8. Perfect facilities for feeding, the top of the press being even with the floor, so that the hops can be pushed or slid into it.

Horticultural Scenes.

As the State goes to San Jose next week to attend the first fair of the fall of 1887, we deem it timely to insert a few glimpses at the scenes which are figuring so largely in the prosperity of the Santa Clara valley and are winning for it a world-wide reputation. Unfortunately, the artist cannot cope with nature, and to one who can see the symmetry and beauty of well-pruned orchards, the neatness of the clean culture and the grand vistas of distant hills and plains which can be seen between the rows of trees, the little sketches which we give must seem somewhat inadequate. Any one who attempts to portray natural scenes by the engraver's art must be conscious of his limitations, and yet the effort is made and intelligent people take an artist's sketches as but suggestive, and trust to the imaginative faculty to complete the picture.

The sketches show three of our chief kinds of fruit while in bloom. Whatever may be the charm of the mid-summer wealth of foliage or the later grandeur of ripening fruit, there is a delicate loveliness pertaining to blooming-time which charms by its grace and perfume and enriches by its profusion. The blooming coming, too, at a time when the orchard has been for months a dreary scene of bare swaying branches, and has known no activity save the clip of the pruning-shears or the hiss of the spray-nozzles charging hither and thither, filling the air with malodorous or caustic vapors, makes the sudden bursting into glorious bloom all the more marked and grateful.

One engraving shows the prune in bloom in the orchard of S. F. Leib. The artist has not chosen quite as good a tree as he might have found. One headed a little lower and with the branches shortened in a little would perhaps have better shown the prevailing style, but still the tree is the prune—the prune which is filling the valley with wealth and at the

same time retaining within our borders hundreds of thousands of dollars which would still be going abroad were it not for the skill and enterprise of California producers.

Another sketch shows the cherry orchard of J. H. Flickinger, in bloom, excellently shaped trees, branched almost to the ground, and still

which are items of industrial importance as well as pleasing to the eye, are perhaps more characteristic of California orchards than of those of any other fruit region.

Somewhat in contrast with the scenes in orchards on the level is the pretty view of the Buena Vista vineyard, with the low-pruned

Railway Notes.

The Pacific Railway Commission has continued its sittings in this city during the week, and will probably be at work a week or more longer. So far, we do not discover that very much has been drawn out, as those who are supposed to know either show wonderful lack of memory or refuse to answer questions which touch vital points in their armor. These seem to be mainly concerning the interior history of the construction of the Central Pacific and the use of money for "counsel fees" and the like. The Commission seems to have very thoroughly informed itself as to what corner of the fence there may possibly be dark things hidden in, while railway men seem quite as expert in not telling anything. It is quite likely that the Commission, from its understanding of the subject, may learn more from such testimony as they get than the reading public can. They seem to be somewhat inclined to appeal to the United States courts to see if witnesses can refuse to answer their questions. Their report which will be made at the next meeting of Congress, will be awaited with much interest.

SONOMA IN BOSTON. — A leading

officer of the Santa Rosa Board of Trade has lately received a letter from the secretary of the Massachusetts Charitable Mechanics' Institute encouraging the former association to make a display of the products of Sonoma county at the triennial exhibition of the latter, which is to open at Boston September 27th. Accordingly arrangements are being made to send on such samples of the minerals, native woods, cereals, fruits and various farm and factory products as shall reflect credit upon "Old Sonoma" and prove an effective advertisement of its claims upon the notice of Eastern immigrants.

WHEAT has touched the lowest price in Vienna reached in 23 years.

THE CHERRY IN BLOOM.

ALMOND ORCHARD IN BLOOM.

HORTICULTURAL GLIMPSES IN SAN JOSE AND VICINITY.

so shaped that the cultivator can approach quite near to the tree, leaving but a few strokes from our friend with the hoe to stir the dirt just at the base of the tree. These trees, when the leaves appear, will be models of symmetry, and not an inch of bark exposed for the sun to blister. The cherry is also a great fruit in the Santa Clara valley. We know no region in which larger areas of well-kept cherry orchards can be seen, although other districts have good culture and broad acres also.

The sketch of the almond orchard in bloom on the Bradley ranch has a wider range and gives a better idea of the general appearance of a good California orchard. The true lines of the trees, their uniformity of size and shape,

vines reaching in straight lines as far as the eye can reach, though the ground be uneven, and the vines creeping also well up the hillside on the left. Only where the slope is too abrupt are the native oaks allowed to retain possession of the scene, and they add to the beauty. Instead of being but slightly elevated above sea level on the floor of the Santa Clara valley, as are the great orchards, this vineyard is 1000 feet higher in the hills along the eastern rim of the valley. If one goes now to San Jose he will find trees not in bloom but in fruitage. There will be at the fair next week most beautiful displays of the ripe fruit in the pavilion, but a slight exponent of the amounts which a visitor can see in the orchards.

CORRESPONDENCE.

Correspondents are alone responsible for their opinions.

Notes of a Trip to Boomland.

EDITORS PRESS:—I have just returned from a 10 days' trip to Southern California, where I saw much that greatly interested me.

They are certainly turning things topsy-turvy down there with a recklessness that takes one's breath away. The very air is full of great undertakings, and each day sees the projection of enterprises enough to last a common slow-going community a month or more. New railroads fill the air with the sulphurous smoke of their blasts as they tear out the sides of mountains to make room for their tracks; great dredgers are making a salt-water lagoon into a commodious harbor; beautiful hotels are springing up on every hand in towns and projected towns; water companies are laying pipes by the mile; towns composed exclusively of fine dwellings of the latest and most improved architectural designs are springing up on every hand in the dry and forbidding deserts, on lofty heights or in sheltered nooks; street railroads, horse, cable and electric, are being built where it looks as if they would not get one passenger per day; electric lights glare down on sagebrush plains, and newly-plowed streets and artificial stone sidewalks and grassy lawns, where there is not a house nor the semblance of one within a mile, surprise the traveler as he rides over the uncultivated wastes.

Everything seems reversed. First the graded streets, then the fine sidewalks, then the lawns, then the dwelling and hotel, then the cultivated ranches. And the business to support all these—will it come? In some few places yes, perhaps. In three-quarters of them, no. I can compare the land and town lot craze down there to nothing but the mining stock craze that we experienced a few years ago. Hundreds and thousands are getting rich—that can't be denied—but the whole thing seems to me to be forced, feverish and unhealthy.

Grand Sights.

But there are some grand features in Southern California—I mean her ranches and vineyards and orange groves. I had occasion to visit Mr. D. Freeman (the owner of the Centinela ranch) to whom I had sold one of my big Hurricane haypresses. I found the ranch to be a little patch of ground seven miles wide by ten long, lying southwest of Los Angeles near the seashore. When I came in sight of it I was amazed. I was on a little eminence where I could overlook it to advantage, and such a display of hay and grain stacks I never saw before. The entire tract was covered as far as the eye could reach with stacks from 40 to 300 feet long, and so great was their number, to count them was an impossibility. They diminished in the distant perspective till they appeared like little yellow streaks on the horizon miles away. It was really a relief, after riding by the cities of Terrace Heights and New Westminster and Hyde Park, to come upon such a healthy looking, business-like section, where men were engaged in producing something of value instead of laying out town lots or grading streets that will not be used for years, if ever.

It was exceedingly warm while I was down there, and I did not see a comfortable hour or get a breath of satisfying lung-expanding air till I got back to Port Costa. Others may say what they will about the climate of San Francisco, I for one will never open my mouth against it again, and I here record my opinion that its climate is the best, all things considered, on the coast, excepting, perhaps, the eastern shore of San Francisco bay.

Perhaps invalids and people of leisure may find Santa Barbara or San Diego more satisfactory, but to men and women of active habits or laboring men, the cool, bracing, life-giving breezes of San Francisco and vicinity must be vastly preferable.

Berry's Steam Harvester.

On my return I stopped over a day or two at Tulare (a lively looking town), and drove out to see Geo. Stockton Berry's steam harvester, of which your readers have heard so much, at work. To say that it realized my expectations hardly expresses it. It was just grand to see that immense machine walk off through the almost illimitable grain-field that it was working in with never a horse or mule within half a mile of it. I make no attempt to describe it, but merely record my own sensations.

When ready to start at 1 o'clock, Mr. Berry asked me to take a seat by him on the toolbox, which I did. Over our heads was stretched a large canvas awning some 20 feet square that protected all the men from the sun and allowed the cool breeze to sweep under it. At the word the engineer (Mr. Berry's brother) turned on the steam, and away we went smoothly and steadily about as fast as a man ordinarily walks, cutting a swath twenty-two feet wide just as easy as winking. Just ahead of where I was, a lazy fellow sat in a comfortable spring seat twisting a wheel like a car brake to the right and left and guiding the ponderous machine where he wished to an inch. Just back of me was the fireman, another lazy fellow, leisurely poking straw into the furnace to keep up steam. His hat hung up near him, as if he was in a room, and his little black dog lay in

the straw behind him watching him affectionately.

In front of me was the engineer doing nothing at all, but alert and ready if required. On the other side of the boiler was a dusty-looking fellow with an oilcan in his hand, squirting in a little here and a little there, looking mighty wise and pretending to work.

On a separate platform on the outside of the separator was the sack-sewer comfortably seated in the shade sewing the sacks and dumping them off upon the ground at intervals. Altogether there were six or seven men who looked to me as if they had what is called a "soft thing," notwithstanding the fact that they were cutting and putting in the sack, ready for market, 30 or 40 acres of wheat per day. A similar machine of wider cut near by was cutting 60 acres per day with the same force. And the straw—

The Waste Straw.

Or rather a small fraction of it—was doing the work. The men I have spoken of pretended they were doing it, but I was not deceived; it was the straw. And the straw has, can and will plow the ground, as well as reap the harvest of the great valley 100 miles wide that extends from Bakersfield to Red Bluff—almost 400 miles. Not only will it do that, but it will haul the grain to the railroad station, when the roads are prepared for it by fuel and water stations—all, too, within the next few years, mark my words.

JACOB PRICE.

San Leandro, Aug. 2, 1887.

Southern Humboldt.

EDITORS PRESS:—Your favor inclosing Mr. R.'s letter, asking about Humboldt county, is at hand. I will answer his questions first, not only for his benefit, but for all seeking homes where water and wood are plenty and land for growing fruit is cheap.

What is the price of land in your county?

In the valleys, river bottom, per acre, \$100; in the foothills, suitable for fruit, unimproved, per acre, \$10.

Is there any Government land, or would there be a show to buy the abandonment of a quarter section?

There is some Government land here yet, and I know of one or two chances to buy claims.

Can a man, willing and able to work, make a living on 80 acres?

A man cannot make a living in the hills raising stock (which is the custom at present); but with ten acres planted with good fruit, 30 acres to farm in hay and grain, and the balance in pasture, I answer: He can.

What is the produce of the county?

In the valleys, hay, grain, potatoes, corn, butter and cheese, lumber and fruit. In the foothills, lumber, butter, wool and some good fruit.

Do you have to irrigate?

There is no need of irrigation for hay, grain or fruit in this county, as we have an average rainfall of 48 inches in the winter.

Is good well-water obtainable?

We do not dig wells in the foothills, as there is plenty of nice, cool spring-water for all purposes and to spare.

General Statement.

Now I believe I have answered all Mr. R.'s questions, and as I seldom see anything in your valuable paper about Humboldt county, I will state a few additional facts, which may be of use to those seeking homes. We have always been shut off from the rest of the State through lack of railroad communication, and people living at a distance know nothing of our county, except that redwood lumber is manufactured there. We are not behind any county in the State in productions. We have vast forests of redwood timber; we raise fine crops of hay, grain, potatoes, corn and dairy produce in the valleys; we have an abundance of rain, therefore no need of irrigation.

Ascending the foothills in Southern Humboldt, at an elevation of from 500 to 1000 feet, we leave the coast fog behind and have a bright sun and clear sky all through our long summer. When we get a railroad to unlock our prison doors and open a market for our fruit, Southern Humboldt will become one vast orchard. Here may be seen the grape, peach, plum, prune, apple, pear, quince and all kinds of berries, growing side by side in the same garden without irrigation. There are thousands of acres, now occupied by cattle and sheep, that would be cut up into 40, 60 and 80 acre lots to furnish homes for hundreds of families. Busy hands would soon cut down the worthless brush, and in its stead plant the apricot and all the various fruits just enumerated; and even the orange would not refuse to bless us with its golden fruit.

Many times through our long summer the thermometer reaches, and even exceeds, 100° in the shade; but the evenings are delightful and the nights cool enough to sleep under a pair of blankets.

I have no land to sell. I write this for those who are scorched with the burning sun of Arizona; who are tired and sick of the alkali water of the plains, who are kept poor with buying wood and water—in short, to all who have strong arms and willing hands, all such can find good homes in Humboldt county.

With 10 or 20 acres planted in good fruit, such as the market requires, and the PACIFIC RURAL PRESS as a companion to encourage and instruct you, there is no such word as failure—at least not in my dictionary.

D. L. MILLER.

Camp Grant, Humboldt Co., Cal., July 23, 87.

Sebastopol and Thereabout.

EDITORS PRESS:—Having sojourned for a few days in this neighborhood, a pleasant land of hills and valleys, a few notes may be acceptable.

Just now considerable interest is manifested in a contemplated railroad project, to connect by narrow gauge this place with Petaluma, and thence southerly to McNair's landing on San Pablo bay, near the two small islands called the "Sisters."

I was informed on good authority that McNair Bros. had guaranteed the funds to build the road as soon as the right of way was secured. A meeting to further the enterprise will be held here this afternoon (July 30th).

This locality appears to be especially adapted to fruit-raising, the variety principally cultivated being the peach. The trees now are loaded with the beautiful luscious spheres, affording food and drink, and freely offered with generous hospitality to the stranger within the gates.

The residents hereabout are all enthusiastic in praise of the delightful climate and other advantages they enjoy—beautiful scenery, fertile soil, proximity to market and social privileges, altogether rendering it a very desirable place of residence, the breezes from the Pacific, but a few miles distant, so cooling the atmosphere that the summer temperature is seldom uncomfortably warm.

Driving from Forestville toward Sebastopol, I took a by-road, avoiding the sandy road mainly traveled, passing the pleasantly located places of Baryilla Rey, G. N. Sanborn and Otis Allen, and made a call on an old acquaintance, Capt. C. M. Seammon, who, after many years of plowing the ocean, much of the time in the service of Uncle Sam, in the Revenue Department, has now cast anchor in a delightful haven, where he has found the prize he was in search of—restoration of health—having been advised by his physician, a decade ago, that only by change of residence from the vicinity of the bay could he expect a more than brief continuance of existence.

If piscatory diet and recreation is desired, a lagoon near his residence affords an abundant supply of catfish, which the commissioners stocked the pond with.

I was impressed with the evidences of prosperity exhibited on every hand as I passed along by the comfortable-looking farmhouses and well-cultivated orchards, and substantial spring wagons drawn by the fine horses for which this region is noted.

I enjoyed a brief interview with Mr. Canfield, an old gentleman resident a few miles south of Sebastopol, who informed me that when emigrating to Oregon, in '46 I think, his party was attacked by Indians, and of the 18 men but three escaped massacre. His own wife and five children, and several other women and children of the colony, were taken prisoners and held in captivity about a month, when they were ransomed by the Hudson Bay Company. During that time they were well treated, but required to perform such work as they were able to do, the women being kept employed principally in manufacturing clothing from cloth they had stolen from the party.

Mr. C. is now well advanced in years and living in a pleasant home with the wife of his youth, his companion in all the dangers and enjoyments that have fallen to his lot during an eventful life. But two of the children that accompanied him to this coast survive, and are living in other parts of the country. P.

Sebastopol, Sonoma Co., July 30th.

Tehama County Notes.

EDITORS PRESS:—I see in your last issue, July 30th, a very timely and pertinent article under the head of "The Subscriber's Duty and Privilege." The condition of things that called for the article exists in this Tehama county in a pre-eminent degree. Very frequently do I hear it said that there is very little of interest to the people of the northern part of the State in the PRESS. It is full of Los Angeles, San Diego, Riverside, Santa Barbara, etc., so that a stranger would suppose that these, and a few other places in Southern and the southern part of Central California, were all there is of the State worth mentioning. To this I answer that it is the man of self-assertion that comes to the front. No one can deny that the places mentioned have asserted themselves. Line upon line, line upon line, here a little and there a great deal, has issued for years from the self-assertive dwellers in the lower portion of the State. And what is the result? They have caused it to be known as the land of booms, and attracted and absorbed the seekers after the healthful homes and profitable industries which can be found in any portion of the State.

For our part, in this county, the majority of us are contented to "labor and to wait." Our boom is a silent one. "Speech is silver, silence is golden." The young orchards and vineyards that are just beginning to checker

our brown plains and hills with verdant beauty are speaking in tones that will cross the continent and the oceans, and if our growth be not rapid, it will be healthy, vigorous and lasting.

Traveling on business in the southwestern part of our county, I met with much to interest and encourage. In this section, grain-raising commenced very shortly after its advent on the river-banks, while cattle, hogs and sheep still continue to diversify the interests and occupations of the landholders. From 20 to 30 miles west of the Sacramento river (and west of land of a much lighter and weaker quality, much of which is yet innocent of the plow and pastured by sheep), is a strip of adobe hills with a house and orchard and vineyard in every valley large enough to contain it, with few exceptions, for even here the easy-going and improvident have made it possible for men of thrift and energy to add farm to farm. The orchards are nearly all young, and more thrifty and healthy trees can scarcely be found in the State, even where irrigation has been constantly practiced. The seven-year-old orchard of the Ruff Bros. of Paskenta is proof of the industry, care and intelligence of the owners, and of the capacity of the soil for successful horticulture. The trees, 24 feet apart, all but meet overhead, while the trunks are, many of them, 20 inches in circumference. The vines are equally vigorous, and neither have been assisted by other than celestial irrigation. At the farm of these enterprising brothers, I saw, too, one of the finest four-year-old Percheron stallions that ever received its first inspiration of the air of "La Belle France." Other orchards and vineyards in the same vicinity, notably that of Mr. H. Wakefield, are objects of just pride to the owners and will very soon be sources of great profit also.

RECTUS.

Red Bluff, August 1, 1887.

HORTICULTURE.

The Bamboo in Japan.

EDITORS PRESS:—Having just returned from Japan, where I traversed the length and breadth of Nippon or Japan proper, from Yokohama to Nagasaki, visiting all places where any fruit trees are raised, and making close and careful observations, I am now in a position to give you a full and accurate account of the different varieties of fruit and other trees growing there, as well as to correct some erroneous statements which have lately appeared in print. Allow me to say that in all Japan there does not exist anything like the large nurseries which we are accustomed to see in the United States. This may be owing to the general poverty of the lower classes or their lack of energy—the fact is that the raising and propagation of fruit trees, like all their other industries, is carried on on a small scale, the largest pieces of ground owned by one man not comprising more than a couple of acres, and that but rarely. Our nurseries in Yokohama and Anijo, supervised and controlled by Mr. Louis Boehmer of Yokohama, are the most extensive. Our stock, which is exported annually, is raised there most carefully, and we are thereby enabled to guarantee every tree and plant to be true to the name and description given.

I will endeavor to give you, in a series of articles, the main points of interest regarding Japanese horticulture and agriculture, beginning with

The Bamboo.

Which is one of the most largely cultivated products of Japanese soil. Seeing that it enters into the structure of the houses they live in, of almost all articles of domestic use, and of a great many of their ornamental fabrics, and that it serves to a great extent as food for man and beast, it is no wonder that great care is given to the culture of bamboo.

Of this useful plant, two main classes are to be distinguished—(1.) The Giant bamboo, so called on account of its height. (2.) The smaller or Dwarf varieties. "Ta-ke" or "Da-ke" designates Giant growths; "Chiku," the Dwarf species.

I have said it enters into construction of their houses. The common Japanese house is built of uprights filled in with split bamboo, which again is plastered over with damp clay, which, as soon as it has dried, forms the walls of the house. For this purpose the smaller variety of bamboo is often used.

The pipes leading rain-water along the roof and off into the ground are made of Giant bamboo, several inches in diameter. Their gardens and houses are replete with bamboo articles, trellises, fences, water-pipes, hen-coops, dippers, the inevitable receptacle for tobacco ashes, children's toys, screens for ornament, curtains to windows, shelves—everywhere is the bamboo.

The tender shoots, boiled and prepared like asparagus or artichokes, are not inferior in taste to those vegetables. The leaves are greedily devoured by cattle.

The Moso-dake or Moso-take is the variety which grows largest in girth. I have brought with me a stem which measures at the base 21½ inches in circumference, and, when cut down, was 42 feet in length.

The bamboo requires a deep, loose, mellow soil—old forest mold is very much to be recommended. The plant does not acquire its full size within a year or two after planting—like

most desirable things it is a matter of development. Thus the root of the thickest Giant bamboo planted the first year will produce a shoot only about one inch in diameter.

The second year the shoots will come forth somewhat stouter; and so on until in six to eight years they have attained their full size, from which they will not vary materially afterward. The full height will be attained the second or third year.

The bamboo forests are thinned out every year, and new shoots allowed to come up freely. In planting, whether pot-grown plants or roots are used, the main point is to keep the young plantation from drying out, until once well established, which may depend on the properties of the soil in which they are planted.

Once the bamboo has taken proper hold of the ground—which under favorable circumstances takes from one to two years—it sends its roots so deep in the earth that it does not require any more moisture than our fruit trees.

In the Southern States, where summer rains prevail, it might not need any artificial irrigation; the main point is simply never to allow a bamboo plant to get quite dry until it has a well-established root-system.

In Japan the time for young shoots to come forth is from April to June. Once the bamboo shoot has made up its mind to come forth, nothing will keep it back. In connection with this, let me relate an amusing incident. We were traveling in the southern part of Japan. Mr. Kobe, a friend at whose residence we were stopping, took me to his bamboo grove at 10 o'clock in the morning, and showing me a very strong shoot, which was about one and a half feet above the ground, asked me to mark it carefully with a private mark. With a knife I cut my initials on it. At 4 o'clock P. M. we visited the same spot, and the shoot had grown to a height of nearly six feet. You can imagine my astonishment. I was told that in China criminals used to be put to death by tying them to the ground in a place where a bamboo shoot started to grow, thus impaling the poor wretch.

The uses both of the Giant bamboo and of the smaller varieties, which rise all the way from 4 to 10 feet, are innumerable. It would assuredly be of the greatest service to introduce this plant largely in America. With it, as with all plants not as yet familiar to our horticulturists, a series of intelligently conducted experiments would be advisable. In Japan, bamboo is grown in regular forests. The sight of one of these is magnificent. The high, slender stems, with their rich, leafy crowns, form a spectacle never to be forgotten.

The Dwarf varieties are remarkable for their beauty of stem or foliage. As if to make up for their smallness of stature, the Creator has furnished them with square or curiously twisted stems—black stems, finely variegated stems—or lovely variegated foliage.

[A set of all the varieties of bamboo, both Giant and Dwarf, can be seen at the RURAL PRESS office.]

In my next I will try to give you my impressions and facts on oranges of Japan.

317 Washington St., S. F. H. BERGER.

Sulphuring Fruit.

EDITORS PRESS:—In the *Weekly Bulletin* of July 27th is an article taken from the *Haywards Journal*, written by Judge W. C. Blackwood, in condemnation of the practice of sulphuring apricots and other fruits, which is, I think, misleading, and from my experience in the business of fruit-drying not altogether correct. I have been drying apricots the past ten years; for three years in the sun, after that time in a Plummer dryer—until I discarded it, and made a drier more in accordance with what my experience in the business suggested. My process of sulphuring is this: The fruit is cut and placed on trays, each tray holding from 25 to 30 pounds. My sulphur-boxes hold ten trays each. I seldom put in more than six trays holding altogether, say 150 pounds of green apricots on the floor of the sulphur-box, and about 15 inches below the fruit I have a pan. In the pan is about an inch of earth (for safety); on the dirt is a piece of gunny sack charred. On this I put not over four table-spoonfuls of sulphur, wet it with a little alcohol, so that it will ignite quickly, then close up tight. Twenty minutes or half an hour is long enough to do the work. The trays are then placed in the drier. Now the question is: How much harm, if any, does the four table-spoonfuls of sulphur do the 150 pounds of green fruit? Mr. Blackwood says: "The fumes of the burning sulphur totally destroy the fragrance of the freshly opened fruit, and that the poisonous gas has penetrated its freshly opened pores, and has forever destroyed its flavor." If this is so, the apricots grown in Alameda county are not like those grown in Ventura county, which, by the way, a great many orchardists in these parts claim to be the best grown in the State. As to the gas or fumes of the sulphur penetrating the freshly opened ripe fruit without some force to drive it into the fruit, I don't believe. If it takes from five to six pounds of the green fruit to make one of dried, how much of this injurious gas is driven off in the process of evaporation? Tell me this. And as to fragrance and flavor, I have several tons of dried apricots packed and ready for shipment. If Judge Blackwood's nose is good on a scent, he can readily perceive the fragrance from my apricots 200 feet away.

I have had apricots growing on my place 12

years, and ought to know something about fragrance and flavor, and have yet to learn that sulphuring detracts one iota from original flavor.

The question, how much sulphurous acid remains with the fruit, can easily be ascertained, I presume, by an analysis of the fruit. I think the RURAL PRESS would be doing a good thing by exposing the sulphur-bleaching process, if there is, as some claim, death in it.

I would have it understood that it costs money to put up a fruit-drier. There has been this season an immense quantity of apricots dried in the sun, and if you, Mr. Editor, have ever watched that operation (as done by the average man), fruit spread out here, there, and everywhere, in places clean and unclean, covered with insects day and night, seeking "fragrance and flavor," depositing eggs to be hatched out in the near future—do you wonder at the cry raised against evaporated bleached fruit, when so much of the unclean stuff has to be worked off? I do not mean to say that all the sun-dried fruit is of this character, but I will wager my last cent that 90 per cent of it is doubtful. I do not think Judge Blackwood's article is written to help the sale of sun-dried apricots, but I do think it will be used as a lever to boost the open-air fruit.

J. HOBART.

Ojai, Ventura Co.

[Mr. Hobart sends a sample of his fruit, and it is very handsome, and has fruity fragrance and flavor. We should say it was sulphured very skillfully. As for Judge Blackwood's motive in writing against sulphuring, the writer is correct, that his position is not dictated by private interest, but from his conception of the widest public interest. Judge Blackwood sulphurs his fruit because the market requires it; at the same time he thinks public taste should be taught not to require it.—EDS. PRESS.]

GRAPE-GROWERS' MEETING.—A regular meeting of the Grape-growers' and Wine-makers' Association of California will be held at the Grand hotel, San Francisco, on Tuesday, the 16th day of August, 1887, at 11 o'clock A. M. —E. H. RIXFORD, Secretary.

FLORICULTURE.

Window Gardening.

EDITORS PRESS:—There are a plenty of Marthas in this world burdened with many cares, to whom the luxury of an out-of-door garden is impossible because of lack of time, maybe, or worse still, because they are cooped up in a few little rooms, where their front yard is the street and their back yard a miserable little boarded square dark and damp.

To such, and to the helpless invalid who sits day after day pining for sunshine and greenery, the miniature garden in the window is an untold luxury.

Of course it is like anything else, and can be made, like an out-of-door garden, a source of much work, trouble and expense, or, on the other hand, by judicious selection and the exercise of intelligence, the constant source of pleasure, and with comparatively a small amount of work or money.

Causes of Failure.

There are many who, being wealthy and able to indulge their whims, buy costly flower-stands as they buy pictures and furniture, because they think them necessary to general effect. Having procured the stand, they proceed to a florist's establishment and buy delicate ferns and begonias, never stopping to think as to whether they know anything about the care necessary to make such plants flourish. As a consequence, the plants, always tender, being changed from a hot-house to the ordinary temperature of a living-room, and, in all probability, left after a few days to the tender mercies of a Chinaman or hired girl who soaks and dries them alternately as she remembers or forgets them, drop their leaves, refuse to bloom, and instead of being a thing of beauty turn to sprigging, sickly stalks, and are thrown out in disgust by the owner, who wonders that her plants never do well.

Care.

Any one who truly loves plants will make them grow, just as any one who loves children will make them happy and do just the right thing for them, and there are many who grow tender and delicate plants in their window gardens and grow them to perfection, but it takes time and attention. One lady, whose window was a glory of ferns, begonias, gloxinias and calceolarias, told me it took her an hour or two every morning watering, training, picking off dead leaves and doing the manifold little things one finds to do where one's heart is in it.

The main thing any of these plants need is judicious watering, occasional pinching or trimming back and repotting once in awhile (say every six months, if they are vigorous), giving them each time pots just a trifle larger than the previous ones, not crowding the roots and yet not giving them too much room, as they bloom better when very slightly cramped.

Soil.

A good soil for house plants is made by taking one-third old, well-rotted manure, one-

third sand and one-third rich black loam or leaf mold, rather coarse and light in texture, from the woods. This last it is not always possible to obtain, especially for those living in cities, in which case common soil has to do, and does do very well in conjunction with the manure and sand. This mixture, especially where leaf mold is to be had, never packs, but is always soft and easily stirred—a very desirable quality where house plants are concerned, for any one who has kept them knows how tightly the soil will sometimes pack around their stems, rendering the task of loosening it almost impossible without disturbing the roots.

Watering.

The main trouble in their care, however, is generally in the method of watering. Either so little water is given that the earth cakes and the plant fairly dries out or else it is kept in a dripping state continually, rotting the roots and killing it. Sometimes, too, the water is administered in a sort of ague, so to speak; something on the principle by which the man fattened his pigs with a streak of fat and a streak of lean alternately, giving them all they could eat one week and nothing at all the next. One who is used to the feeling of the pots can tell by their weight whether they are moist enough. Err on the side of dryness rather than wet, and try never to have the soil soggy. Of course, where plants sit in the hot sun they take much more water than those in the shade; but even then one is very apt to be deceived by the dry surface into putting on more water when the bottom of the pot is filled with ooze.

Do not be deceived, either, by the water running from the bottom of a dry pot. If the soil is hard, when it gets very dry instead of soaking in, the water runs down, around the dry earth, and out at the bottom, never wetting the plant at all. If you have been so unfortunate as to dry them badly you had best immerse the pots in water for a half hour and allow them to soak, after that watering sparingly for a few days.

All pots should have a good drainage. Some who ought to know fill the pot a third full with broken bits of pottery and coarse pebbles; I prefer bits of charcoal, however.

Signs of Disease.

If your plants drop their leaves and turn yellow, look closely for the cause. See if they are too wet or too dry; if not, examine for insects. The mealy bug may be exterminated by a drop of alcohol, the red spider generally by a good wetting down, and where plants are in pots this can easily be done by putting them bodily into water and fairly drowning the pests out, while it will not hurt the plants. Blight may generally be corrected by dusting with sulphur, stirring the soil or repotting, and giving more sun. I have never seen the little white worms which sometimes infest the earth around potted plants except in soggy soil. I find that where the soil is reasonably dry I do not have them.

If the trouble seems to be weakness of root and "general debility," so to speak, try soot tea, made from wood soot, the cold tea from the table, or very weak ammonia water. These act as fertilizers and are delicate and strengthening.

Do not allow your plants to grow up tall and stinky. Clip the ends to encourage new shoots, even if it does go to your heart to destroy a month's growth. You will be repaid for it by the amount of new leaves and blossoms you will receive, for, giving a new impetus to the plant by forcing back the sap, it brings blossoms in abundance, as they come on the new shoots.

Hanging Baskets

Are the hardest to make grow, as well as one of the most beautiful attributes to the window garden. They need plenty of water, and when it is put on in the regular way, in order to prevent a dripping overflow on the carpet, they are stinted in quantity. Once in two or three days take them off their hook and immerse them completely in water; let them soak there a few minutes and hang them to drain. When their dripping stops, they may be hung up in their places bright and fresh, their dusty foliage clean—truly a thing of beauty. I have kept, in this way, large baskets continually fresh for months.

Choice of Plants.

Smilax will generally do well with good soil and a little sun. It will, however, need a rest once in awhile, and you must not be disappointed if, after a time, your vigorous potful which came but a few weeks before from the florist's, lovely and green, turns yellow and drops its leaves. It is merely getting tired and needs a rest; take your scissors and clip it close and rest it, without much water or sun for a week or two; then give it care and water and it will shoot up fresh and new.

So much for the general care of plants for the window. As to the varieties of suitable house plants for a handsome stand, I shall not attempt to take up the subject, for any one who has time to devote to them and a little money to spend can go to a florist's and in 20 minutes select any amount of lovely plants for such uses, and far more to her taste than any I could suggest.

There are many, however, who cannot, as I said in the beginning, do this, and to them I would make a few suggestions. If then you want these little pleasure-bringers with the least possible work attached, select common flowering plants, such as we have in our gardens, and be content with them. If you can-

not afford to buy them, get slips of what you can, and root them. If you can spend a dollar or so, select sturdy, growing, constantly blooming plants, which require small care and pay well for all that is given them in lovely blossoms. Fuchsias and heliotropes kept well clipped, furnish a constant series of bright blooms, as do pelargoniums, whose variety and range of color is legion. Verbenas, too, are flowers which are loaded with blossoms the year round, and need little water or care.

English ivy grows well in water, and a well-grown plant in a vase looks beautifully with its dark sprays against a white wall.

Hyacinths, too, grow readily in the same way if the bulb is kept in a bulb-glass, and by a little care in keeping a stock in reserve, putting them into the water a week apart, one may have a constant array of these fragrant and delicious blooms for weeks.

Shell Baskets.

Novel and pretty hanging baskets may be easily made from coconut shells by sawing off the top and rubbing and smoothing down the shell. Bore three holes at equal distances near the rim and insert common wire to hang it by, or what is better still, gilt picture wire, leaving the hangers about two feet long.

The only difficulty about using these baskets is their non-porous character, and the fact that they have no outlet for surplus water. I presume they would be benefited by a small hole in the bottom for drainage, but I have kept three or four of them perfect balls of green for months by careful watering.

Use for such baskets verbenas, iceplants, blue lobelia, the small flowering blue and white periwinkle. Any of these look pretty and need little care. Do not attempt to grow the regulation house plants unless you can give them care. Almost any common plants well grown and healthy make a lovely showing and give constant pleasure, and 'tis far wiser to have these in good condition than a sickly lot of ferns and begonias.

FRANCES M. PAYSON.

N. Temescal.

THE STOCK YARD.

Facts Connected With Breeding.

EDITORS PRESS:—All men who have had much practical experience in the breeding of cattle will admit that it is a most intricate subject. "Like does not always produce like." The Suffolk cattle for many years have existed as a breed *without horns*, and yet occasionally one is born with a horn. A thoroughbred mare was taken to India and there was covered by quagga, conception took place, and for several years subsequently she was put to thoroughbred stallions, and each colt was marked with quagga stripes. Surely there are few things that show man's supremacy more than his ability to mold animal forms, adapting them to his special use, the speed of the race-horse, the intelligence of the dog and the size and function of the udder of the cow being evidences. To my mind it is very interesting to notice how, in heredity, habits are transmitted. The shepherd dog, in his first lesson at herding sheep, shows a tendency to run round rather than at them. Pointers and setters early indicate that these characteristic traits are hereditary.

It is thought by some naturalists that mules might be bred from if proper means were adopted. When Nature herself unites two dissimilar animals, by gradual steps, procreation is possible. Monstrosities are produced by some injury to the fetus in the womb. Natural laws are by this fact shown to go on by purely mechanical and definite forces. Cows occasionally twist the uterus, when impregnated, by falling into a ditch or dyke. It has happened that the fetus has been found in the abdomen, accompanied with uterine pains, although, of course, there was nothing to expel. All malformations, such as spavins, ring-bones, curbs, splints, etc., are transmitted. Vice and bad temper also go from sire to offspring.

This is the best point to grapple with disease, particularly lameness. Unite only hardy and healthy animals and you will get less crippled horses. Very frequently I see, and have seen, colts at grass, before their heads have ever been through a collar, with curbs, splints, ring-bones, etc. Horses are worked too young—before their bones have "set;" in reality they are put to hard work before the bones have united; they are little more than gristle or cartilage. Mares in foal and with foal by side should be well nourished, and not overworked. Care should be taken not to keep the young animal too long away from its mother, because when they meet the foal is very liable to take milk into his stomach in such a quantity as to overload that organ, thereby producing diarrhea and emaciation. Wean at fifth or sixth month. If through mal-nutrition a colt once "stunts" or stops in growth, he never thoroughly recovers. Castration at two years of age, he has then nicely developed at neck and fore quarters, and the risk at that time is very little, if any, more than at one year.

ROBERT J. DAWSON,

225 Geary St., S. F. Veterinary Surgeon.

WOODEN SPOONS.—Russia makes annually 126,000,000 wooden spoons for the Central Asia market. The common grades are made from birch and poplar and the best qualities from boxwood.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

Titles and Taxes—No. 2.

[Written for the RURAL PRESS by J. W. M.]

Please let me take it for granted that the land is by nature the entailed inheritance of every one born on the earth, and that this birthright can neither be sold, bartered, taken nor given away. Granting the premises, will it not be clear that the great mass of mankind have been disinherited? Will it be right for them to remain so? For it will be equally clear that the greater part of the habitable surface of the earth is held unjustly. But it will be as clear that the disinherited cannot be restored to their rights without revolutionizing society in every department, including government itself, and violently disturbing legally acquired rights and titles, sanctioned by custom and consent of society.

But because evil has so interwoven itself with the woof and warp of society that society's integral form would be almost destroyed if evil were removed, does that deter us from trying to get rid of it? Because of the suffering and loss of some, shall we perpetuate a system of injustice whose outcome is the daily increase of poverty and crime? Shall vested interests prevent us from laboring against intemperance, war, and every other form of evil? Shall we cancel "Thy Kingdom Come" from the Lord's prayer because the millennium would seriously affect all kinds of vested interests?

If justice be right, it will be right for every one to possess all his natural rights, let the consequences be what they may. Are the vested interests in land more sacred than were the vested interests in human chattels before 1861? Yet a few strokes of a pen destroyed at once at least \$1,000,000,000 of property. That loss now in 1887 is not felt. It is asserted that the South, individually and collectively, has been enriched by it. No doubt many cases of suffering and loss may be recalled, incurred by the slave as well as by the slaveholder, and no doubt if all private property in land was declared invalid, much suffering and loss might ensue in peculiar cases. Nevertheless let justice be done.

Even now we do not hesitate to evict those who are holding land without sufficient legal title when the legal owner calls for it. The history of land tillers in California, with especial reference to Mexican grants, reveals many sad instances in which innocent and honest purchasers of land, which they converted from sterile wastes into beautiful homes and productive farms, have been evicted by an adverse legal decision without any compensation—not even when suffering, poverty, disease and death have been the consequences. For if the Government stepped beyond its functions of making and executing laws to assist the unfortunate victim of ignorance or fraud, that would make it a paternal government, which is said to be a very bad thing indeed, to be avoided at all hazards.

To return the lands to their rightful owners, the people, would be only a simple act of justice. To compensate those who had invested in those lands would be a generous, perhaps a commendable, act on the part of the people, but one not incumbent upon them by the principles of either equity or precedent.

There would not follow one solitary eviction—no reduction to starvation and extreme poverty—only those occupying more land than they could use, or holding without occupying, would know that any change had taken place. Whereas, thousands, possibly millions, would be relieved from the presence of that gaunt specter, want, which prospectively haunts the workingman from the moment he has commenced to make a home for himself, if no nearer acquaintance is actually made. A home would then be open for all. But all neither could nor would seek a home in the country. Professional men would still be needed; all the crafts, arts and trades would remain in demand. Possibly there might not be so much need of breweries and distilleries and other questionable pursuits, for intemperance and crime belong mostly to the extremely poor and the extremely rich, the dangerous classes of society, which we desire to eliminate. Cities, towns and villages would remain, and their inhabitants would retain their inalienable right to the land and their share of the rents, or by whatever name the income from the land might be called. But this would not place the burden of the expense of the State on the farmer, for cities are usually built on land where a front foot is often worth more than a farm. Nor need the only income be from the land, for the income from the land should not be determined by the needs of the Government, but by value to the occupier of the land. If this be not sufficient, then the people should be taxed as determined by the people themselves.

This condition of affairs is objected to as placing too much power in a Government already too strong and corrupt. The Government is already too strong and too corrupt, which strength and corruption looks likely to be perpetuated, being the shuttlecock between the battledores of parties without principles till the party in power is really the Govern-

ment. The success of the land movement will necessitate radical changes in the Government, where checks upon central power, as well as upon individual lawlessness, will preserve order and honesty everywhere—a balancing of the centripetal and centrifugal forces.

The land question is only one of the stalls of the Augean stable, but I think it is the first and most important, and necessitates the cleaning of all the rest. Finance, labor, the liquor conundrum, and scores of questions are shouting in our ears every day and all day. The end, in my opinion, will be the State resolving itself into a co-operative industry, the laws being as dogmatic and arbitrary as the decalogue, and as just and simple as the Golden Rule.

Tulare, Aug. 8, 1887.

Temescal Grange.

At the meeting on Saturday last, a circular from Commissioner of Agriculture Colman was read, asking an expression of the Grange with respect to forestry matters, and an interesting discussion followed.

In regard to planting forest trees around colleges, Brother Kelsey cited the fact that at the opening of the University at Berkeley, trees in almost endless variety were planted over nearly the whole tract. As they grew up, it became evident that the planting had been done with little discrimination, and after all the outlay for growing the trees, the authorities are now going to great expense in having many of them cut down and the roots grubbed out, in order to have more cleared grounds about the buildings. Considerable expense is also being incurred in leveling the surface of the ground in portions of the tract. Brother Kelsey expressed his belief that a more level situation, where less grading was necessary, would be desirable for such institutions generally.

Brother Renwick thought the planting of trees around schools and colleges was a good idea, where their growth could be observed and practical observations made by students and instructors; but there should be plenty of space around the buildings to admit an abundance of sunshine, especially in the Alameda county climate.

It was remarked that considerable attention would have to be paid to keeping the ground beneath the trees clean, and pains taken to avoid more moisture than would be healthful.

As to forest culture in Alameda county, it was conceded that a mistake had been made in planting eucalyptus trees, which have proved to be worthless for railroad ties, telegraph poles and other manufacturing purposes. Had the right kind of trees been planted, no doubt the undertaking would have proved profitable.

Sister Babcock called attention to the fact that eucalyptus trees cut late in the fall and reduced to fine stove-wood, burned too freely and were not at all satisfactory nor economical, while the same variety, cut early in the spring in large pieces, was considered exceedingly good fuel. Brother Renwick had also found it very good fuel and had only one fault to find with it—that of gumming and glazing the stovepipe.

The proposed amendment to the State Grange Constitution, giving Pomona Granges the same rights of representation as Subordinate Granges, was discussed, together with the propriety of adopting the same, but no action was taken on the subject.

Miss Nellie Webster has been requested to entertain the Grange with a recitation at a future meeting.

An interesting article was read by the Worthy Lecturer. It is hoped that there will be a full attendance at the next meeting, Aug. 20th, when work is expected in the First and Second Degrees.

The Debris Evil.

A dispatch to the California Associated Press states that a party consisting of Hon. Marion Biggs, Hon. C. P. Berry, Hon. George Ohleyer, Judge J. H. Craddock and Mayor Greely of Marysville, arrived at Nicolaus by steamer on Tuesday evening, having come to inspect the Feather. They expressed themselves as astonished at the condition of the river, which is full of sand-bars, with places containing only 22 inches of water.

Mayor Greely, at whose instance the trip was made, said that no affidavits could have given him the knowledge he has gained by a personal inspection of the damage done by the mining debris.

Congressman Biggs, upon his return from a visit to the confluence of the Feather and Sacramento rivers with a number of prominent citizens, said that he had found the condition of the Feather river worse than he had supposed. At the mouth of the Feather, the depth of water, as ascertained by sounding on the trip, was only two to three feet, while a little further up the Sacramento there was clear water and a depth of 21 feet.

He believes that the navigation of the Feather is seriously endangered by the continuance of the flow of the debris. He wishes it distinctly understood that, while disposed to help mining all he possibly can, he can never consent to any injury to the streams of the State. His object has been to ascertain if the debris evil can be remedied in any manner satisfactory to hydraulic miners and the State and nation, but says that he has been unable to find any solution.

The Worthy Master Away from Home.

[NUMBER 5.]

[Written for the RURAL PRESS by Mrs. W. JOHNSTON.]

Our party received an invitation to breakfast with the King at his home, the Iolani palace, on June 13th, which we accepted and thoroughly appreciated. The hour set was 9 o'clock, and the guests were very prompt in their arrival.

This royal breakfast was indeed royal in every sense of the word. The moment the massive sliding doors were thrown open and breakfast announced by the King's chamberlain, the band, which was stationed within the palace grounds, struck up a brilliant march, and thus we were ushered into the dining-room.

The table was a marvel of beauty with its fruits and flowers. At each plate was laid a bill of fare and a beautifully decorated card bearing a golden crown and the name of the party to occupy the chair placed immediately in front. This card, together with the bill of fare, the guests were expected to carry away with them as a souvenir of the grand occasion. In disposing us at the table, husbands and wives were in no instance seated together. The stiff, strange feeling that had manifested itself now made a hasty retreat, and conversation flowed as freely and easily as if all were in the habit of dining with royalty.

The courses, 12 in number, were served in a dainty and most appetizing manner. The band entertained us all through the meal by rendering American and Hawaiian airs in their usual charming style.

After spending three good hours in talking and eating, especially the latter, we strolled out for a few moments upon the veranda, where we found comfortable seats provided. Presently the King rose to his feet and the guests were requested to do likewise and remain standing in silence while the band played one of Hawaii's favorite airs, after which the King bade each a cordial "good-morning" and retired, and we wended our way to our respective rooms.

That afternoon some of the party set out for Kilauea, the active volcano, after which they were to visit Haleakala, the greatest extinct volcano on the islands. The next day the remainder of the company, with the exception of a few feeble women and children, also, started to visit the volcanoes, going to Haleakala first, so that they would not meet the first division at any point, as the hotel accommodations were quite limited.

I was not strong enough to undertake this wearisome journey, so remained at the hotel in Honolulu with others in a similar condition. During the two weeks that the sight-seers were absent, we improved the time in riding and walking over Honolulu, and learning the ways of the strange people among whom we were visiting. Meanwhile an American man-of-war sailed into port and we hailed it with true delight, as the mutterings of the gathering political storm were fast sounding in our ears. Shut off from the rest of the world on this lonely island, with no telegraph to tell of what is going on, you feel very much as if you were in prison or buried alive. It is not strange that people love to gossip, it is perfectly natural.

After the return of the wanderers we were invited to visit the U. S. man-of-war. To some of us this was a great curiosity, as it was our first sight of such a thing. Aboard of the ship were 160 men. Capt. Kempff and the other officers took great pains to show us over the vessel, which was scrupulously neat and clean throughout. The men do their own work in the way of making their clothing, etc. They have half a dozen sewing machines on board. We were conducted through the culinary department and shown the many conveniences for cooking for the men as well as for the higher officers.

The large guns were monsters—death-dealing giants they must be in time of war. The smallest of them weighed 9167 pounds. The wonderful Gatling gun occupied a prominent place, and the ladies were invited to try their skill in firing it. It looked like child's play to turn the crank of this seeming toy, which has the ability to fire 500 shots a minute. We lingered and gazed at these wonderful sights until the old, old saying came into my mind—"Visitors should not make their visits too long." At last we took our departure, feeling as if we were leaving home and its protecting arms.

(To be Continued.)

Resolutions of Respect.

EDITORS PRESS:—The following resolutions of respect and sympathy were unanimously adopted at the last regular meeting, August 6, 1887, of Danville Grange, P. of H., No. 85.

M. S. HOWARD, Secretary.

Danville, Aug. 8, 1887.

In Memoriam.

To the Danville Grange:

Your committee, to whom was assigned the preparation of a tribute to the memory of a departed sister of the Order, beg leave to report as follows:

WHEREAS, Death has removed forever from our social Grange gathering, Sister Ada E. Flournoy; therefore be it

Resolved, That this Grange recognized in Miss Flournoy a sister of fine attainments, a sincere and true type of womanhood in every relation of life, and deploring the absence, henceforth, of her cheerful and elevating presence at our meetings.

Resolved, That the sympathies of the members of this Grange are hereby tendered the bereaved fam-

ily, which, a second time within less than a year, has been called upon by the inexorable destroyer to part with a beloved member of its home circle.

Resolved, That this memorial of Sister Flournoy be spread upon the minutes of this Grange, and that a copy thereof be sent to her family, and to the California Patron, RURAL PRESS, and Contra Costa Gazette, for publication.

D. N. SHERBURNE,
MRS. C. E. HOWARD,
CHAS. WOOD,
Committee.

Grange Work and Progress.

[Prepared Weekly by M. WHITEHEAD, National Lecturer.]

The Grange was organized for the intellectual, social and financial improvement of the farmer and his family, to place his occupation where God Himself placed it in the beginning—the first and most honored of all callings. It seeks not to build up agriculture at the expense of any other class, but it would give the farmer an equal chance in all things. "A fair field and no favor." "Justly distributed burdens and justly distributed power." Equal laws, equal taxes, no discriminations of any kind. As educated by the Grange, the coming farmer will be a recognized power in every sphere of usefulness. Commerce will give him the credit which is due him. Politics will take shape from his judgment and will. Society will confess his worth and acknowledge his title to nobility—at least the only nobility that can exist in a republic. Then will our farm-homes become, what under our free institutions they should be, the very strongholds of the land. Then the boys and girls of the farms will not hasten to turn from the hills and dales and streams of their country homes and seek the great cities, where too often they fall into vice and are lost forever to earth and heaven. For the good of our country and the good of humanity, may the time be not far distant that shall greet the coming farmer such as the Grange would make him.

"THE secretary of the Cayuga County (N. Y.) Farmers' Club suggests the formation of an association for farmers' wives. Why not? Surely the labor of the farmer's wife is as important as that of her husband. If the work of the farmer can be improved and dignified by association and combination, surely that of the wife can be dignified and improved by the same methods." We would ask: Why not carry the idea a little farther, and say that the best association would be that which would place the farmer and his wife on equal terms? Their interests are mutual, identical, one with the other. What benefits one benefits both. The knowledge gained is, or should be, reciprocal. Any one who has attended a good Grange meeting will not ask that a special association be formed for farmers' wives. It will readily be seen that the Grange is an association for farmers and their wives—yes, and for all the family over 14 years of age. We say, build up the Grange; don't form separate associations for farmers' wives and farmers' children. Nothing is more unnatural than to separate the family in this way. Bring them together; teach them to "pool their issues," and reap the full benefits of combination.—Rural Vermont.

THROUGH a close, compact, intelligent organization, a revolution has commenced—slow it may be, yet it will be sure, healthy and just. The American farmer realizes now that agriculture must be lifted up to the place where it properly belongs; that he has interests to be promoted and rights to be protected; that his calling must be raised to the rank of recognized power. Let us be patriots and philanthropists, and spurn all sectional tendencies. Let us strive in our Order, as of one mind, to hand down to future generations this republican form of government united and unimpaired. And so long as we shall live, may we never falter in the conflict for the prosperity of our organization and for the good of toiling humanity.—S. E. Adams, Minn., P. M. National Grange.

SPEAKING of speculating wretches, in the year 1788, George Washington said: "I would to God that some one of the more atrocious in each State was hung upon a gallows five times as high as the one prepared for Haman. No punishment, in my opinion, is too severe for the man who can build his greatness upon his country's ruin."

THE existence of the Grange is not ephemeral. It has elements of permanency, and if the members were all fully aware of its benefits, they would not hesitate to advocate and sustain its claims over and above any other earthly organization.

EDUCATION and co-operation, the twins that must go hand in hand in advancing the cause of the Grange and human progress, are one and inseparable. Either alone, without the other, will never help to attain the highest rank in our calling.

PROGRESS.—A new Grange in Alabama.

DURING the last year Missouri has reorganized 40 Granges. Maine has reorganized and organized about the same number. Nearly all States show a revival of the Order. The principles are better understood and practiced to a great extent. Farmers can accomplish the same for themselves that other callings accomplish if they co-operate. If they fail it is their own fault.—Nickerson Kansas Argosy.

MCLARY GRANGE of Epsom, N. H., has just purchased a library and opened it to its members.

AT the last meeting of the Newton and Jasper District Pomona Grange, Texas, a committee was appointed to report a plan upon which to establish a high school in the bounds of the District Grange upon the co-operative plan.

LECTURER HAYES of Oregon gives cheering news of the progress of the Order since the meeting of the State Grange. He is almost constantly in the field. Franklin Grange was reorganized lately with 21 members.

"Words are the daughters of earth, But deeds are the sons of heaven."

SAN JOSE GRANGE, at a well-attended meeting July 30th, discussed horse-training and listened to remarks by Fruit-Pest Inspector Klee.

AGRICULTURAL NOTES.

CALIFORNIA.

Alameda.

DRYING FRUIT BY COLD-AIR BLAST.—Haywards Journal: In H. Smyth's shop, at San Lorenzo, directly back of the blacksmith department, is a room that Henry Dopman has been utilizing for drying fruit on the cold-air blast principle. The cold blast comes from the blower that supplies the "wind" for the blacksmith department, a connection being made with the pipe. In this shed is an iron frame formerly used for heating mold-bands. The cold air is conducted into this apparatus, and can be easily regulated. Inside of this frame Henry places the fruit, on the bottom being a sort of screen. The action of the cold air on the fruit is soon noticed, and on inspecting it in the course of four or five hours one is astonished, as the fruit is dried. Henry has samples of prunes, apricots and apples dried by this process nine years ago, and still in good condition. This process was originated in Delaware and has proven a success in every particular. Henry informs us that hot air is as good in drying as cold air.

Butte.

WILL GO DEEP FOR WATER.—Marysville Appeal, Aug. 5: A great undertaking in the way of boring an artesian well will be commenced by N. D. Coombs on his ranch south-east of Moore's Station at the completion of the harvest. He has made preparations to go down 1500 feet, if necessary. The land in the section mentioned is good for sheep-grazing during a considerable portion of the summer, but with a supply of water the year round the farmers say that they can make the land produce anything. Mr. Coombs thinks that the water can be obtained between 800 and 1200 feet, but he calculates to go 1500 feet before becoming in any way discouraged. This will be the first artesian well in that section of the country, but should it prove successful others will at once bore for a flow. Excepting the wells of the city water works there have been but two artesian wells bored in this county; one by W. F. Lavy, four years ago, when he struck water at a depth of 30 feet that flows the greater portion of the year, and another on Mr. Ebbett's ranch, in Plumas district, which was bored to a depth of over 200 feet in 1864.

CASTOR BEANS.—Gridley Herald: Henry Robbins recently planted 20 acres of his land in castor beans. The season has been very unfavorable, not a drop of moisture having fallen since the plants came up. July 15th he made his first picking, getting 270 pounds of beans; the second picking, July 25th, 296 pounds was the yield; the third time he got 330 pounds. From present indications, he will be obliged to pick the crop every seven days until frost comes. It will be seen that the yield for July was 896 pounds. No trouble is experienced selling the beans at four cents per pound, and there is always a demand for them. Taking the July yield as a basis—with only three pickings made—it is safe to estimate that the yield will aggregate closely to 1200 pounds per month. As the season for picking will not expire until December, the total yield for the year is likely to aggregate 5500 pounds—equivalent to \$220, or \$11 per acre. This beats wheat-raising, so far as profit is concerned, as the crop pays out well the first year, better the second, but should be replanted the third. Mr. Robbins is so well satisfied with the result obtained that he intends planting a tract of 60 acres next season on a better quality of land.

Colusa.

GRAIN BEYOND MEASURE.—Colusa Herald, Aug. 5: The wheat crop of Grand Island is the largest known for years. Heading is yet unfinished, and hundreds of stacks of grain are yet to be thrashed. There are seven thrashing crews in that vicinity. Thousands of acres which produced not a spear of grain last season were covered thick with waving grain this year. The warehouses are jammed and the yards also. One yard just north of Grimes was enlarged twice to accommodate the immense quantities of wheat, and lumber is on the ground for another large yard, the crop being only about half hauled in.

Fresno.

EDITORS PRESS:—The fruit industry at present commands obedience from all its followers. The 'cots have been gathered, cured and stored, and now the luscious peaches are claiming attention. An under-estimate is in store for the orchardist, and the lye-process of peeling enables the grower to care for and cure more of his own fruit, and secure the highest prices for himself. The fruit-pack within a radius of six miles from Fresno will be simply immense, considering the age of the trees. On W. M. Williams' ranch of four years' growth, three miles east of Fresno, they have a force of 60 men, employed picking, lyeing, sulphuring, and placing out on trays to sun-dry. The peaches are Early Crawford. Many smaller orchards are being cared for, with the aid of all the family, and tons of dried fruits will repay them for their season of labor. Those who successfully battled against the scale, with the less expensive and more effectual remedy of sulphur, lime and salt, have triumphed over the enemy and saved their fruit; while some others, before knowing of this remedy, dug out their scale-infested trees, but will replant the

coming winter. We note, with pleasure, the different experiments made by experts in attempting to conquer the destructive orchard pests. We hope they will persevere and finally succeed with their tented scale vapor bath, and rub them down with Turkish-towel treatment. If they certainly get the "fluting" and ruffling all done, and keep the cost within the reach of those of limited means, they will receive the benediction of the less favored. Active preparation for handling the surplus grape crop, in making extra trays, sweat-boxes, etc., is consuming all spare time. Already agents are busy securing the coming crop at an advance over last year's prices, and altogether the outlook this year is favorable for the vineyardist and orchardist, as well as the grain-grower.—A. L. A., *Temperance*, Aug. 2d.

AN ITEM FOR HENRY GEORGE.—*Republican*, Aug. 5: The other day a Mr. Gower of Stockton came to Fresno to see about the crop on a half section of land near Fowler, of which he is the owner. The land was planted to wheat by a tenant, and when the thrashing was done and the grain sold to Messrs. Noble & Thompson, the Stockton man found that his share of the crop, for the rental, amounted to over \$1250. As he pocketed the coin he remarked to the buyers: "That's more money than I paid for the land."

RAISIN TRAYS IN DEMAND.—There is a strong probability of there being a shortage in tray material, packing-boxes, etc., to handle the immense raisin crop this season. The Toll house box factory has taken contracts for its full capacity. The Madera Flume and Trading Co. is compelled to shut off on the manufacture of trays on account of the large contracts. The Truckee Lumber Company is not manufacturing trays this season, and as matters now stand it seems impossible to get orders filled. However, our vineyardists can utilize the large supply of "shakes" which are manufactured in this county every season, and make a very fair substitute for the sawed lumber for trays.

Humboldt.

A SAMPLE OF OATS.—The *Standard* has invited farmers, fruit-growers, gardeners and other producers to send for exhibition and mention samples of what can be done in Humboldt county. The first response comes from J. F. Quill of Table Bluff. The specimen sent is a bunch of oats, seven feet nine inches high, grown on Mr. Quill's farm. The stalks are not unusually large, considering their length, and show a luxuriant growth of grain.

Lassen.

GOOD CROPS.—*Susanville Mail*, Aug. 3: Harvesting is progressing rapidly in this county. The hay crop is large, but not up to an average. There is a large acreage sown to grain. The crop will be of good quality. Samples of wheat shown us would rank as No. 1 milling in the San Francisco market. Ike Stewart has just put up 200 tons of hay. He has 75 or 80 acres in oats and barley. Thirty bushels of wheat to the acre will be cut in this neighborhood. Dave Johnston will cut 100 tons of hay and about 800 bushels barley and oats.

Los Angeles.

LOADS OF WALNUTS.—*Anaheim Gazette*, Aug. 4: In every direction the walnut groves are doing grandly. Careful observation now enables us to venture the opinion that the nut crop will be greater this season than it has been in any previous year. Trees everywhere, even the less thrifty, are loaded with nuts. On Mr. Langenberger's place a tree may be seen with one of its branches torn from the trunk and drooping to the ground, its load being too great for its strength to sustain. The people hereabout are now commencing to prop up the overloaded branches. This year larger clusters appear than we ever before noticed.

Merced.

HARES AS HOG-FEED.—*Merced Express*: The rabbit pest has got so bad on the Miller & Lux farm, on the west side, that the firm employ hunters to do nothing else but hunt them down. Over 7000 have been killed this season, and "the good work still goes on." Hunters are refurnished horses, wagons and ammunition, and are paid five cents for every one they bring in dead. After being counted, the rabbits are thrown into an immense vat, a certain amount of grain is added, and then the entire mess is boiled, after which it is fed to the hogs.

Monterey.

ARTESIAN WATER.—*San Miguel Messenger*: Pinkerton & Jackson, who lately commenced drilling for artesian water on their ranch at Pleyto, struck the object of their search last Monday, at the depth of only 130 feet. The flow is strong and rises four feet above the surface of the ground. They have started a second well about two miles north of the first, and will probably drill others. This is the first effort, to our knowledge, that has been made to obtain artesian water in the upper Salinas valley, and the importance of the result can hardly be overestimated.

Nevada.

FOOTHILL ORANGES.—*Grass Valley Tidings*: The orange trees at French Corral are bearing heavily this year, we are informed by Mrs. W. W. Nelson, who has lately been on a visit to that place. French Corral is 1300 feet above the sea level, and its latitude is about 39 degrees north. It will be recollected that last spring the frosts were unusually heavy and very late, but French Corral's orange crop does not fail.

Plumas.

A MOUNTAIN RANCH.—*Oroville Register*: A. Robinson, two miles from Meadow Valley, has his home on the slope of Spanish peak, at an elevation of 4500 feet. The heavy fir timber has been cut down and the finest timothy, clover and alfalfa is grown—nine feet of snow not harming the latter. Corn, potatoes, cabbage, beets, onions, lettuce, beans, cucumbers, squash, and even watermelons are growing on his place. We never saw finer strawberries, currants, raspberries and blackberries than he had this year, while the apple, pear, cherry and plum all do splendidly, except during an occasional year there is some damage by frost. The cold is less by 20° than in the valleys 1500 feet lower down.

INDIAN VALLEY is one of the richest little valleys in the State. It comprises but 15,000 acres of land, yet it supports nearly 60 farmers and their families, produces not less than 6000 tons of hay; affords feed for 1000 dairy cows, a large number of horses, hogs and sheep; turns out tremendous crops of wheat and oats, the latter running as high in some instances as 80 bushels to the acre and weighing 43 pounds to the bushel. There are many fruit trees and vines, while it grows an immense amount of vegetables. Thorough cultivation and the liberal use of water enable the land to produce heavy crops year after year.

Sacramento.

FIRST NEW HOPS.—*Record-Union*, Aug. 8: R. J. Merkley has for many years been the first among hop-culturists in the State each year to put up a bale of new hops. On Saturday, Mr. Merkley picked and cured a bale of hops from his yards, and now has them ready for market. He is thus again first to put the new hops into bale.

San Benito.

CURING 'COTS UNDER COVER.—*Free Lance*, Aug. 4: Joseph Swan brought into this office last Wednesday morning a sample of his sun-dried apricots, a most beautiful and salable article. The color is almost perfect and the flavor excellent. Mr. Swan spreads his fruit on boards and covers them with ordinary house-lining raised about a foot above the boards. This keeps the fruit from turning black by the action of the direct rays of the sun and fog, and leaves it sweet, soft and thoroughly cured.

AGRICULTURAL SOCIETY.—Articles of incorporation have been filed by the San Benito County Agricultural Society, the purpose of which is "to purchase, hold, sell, rent, lease or otherwise control or sell such real property as said society may deal with according to law, and to promote and encourage agriculture, horticulture, mechanics, manufactures, stock-raising and general domestic industry in San Benito county." The trustees are M. Wilson, J. G. Hamilton, S. E. Kent, John Parker, W. T. McCarthy, W. S. Frost, E. G. Camplin.

San Bernardino.

PRIME PEACHES.—The *Semi-Tropic* is under obligations to Hon. J. S. Ward for a basket of luscious peaches from his orchard near the Santa Ana river. Some of the peaches measured between 13 and 14 inches in circumference, and three of them weighed 1½ pounds. They were of the Foster variety.

San Diego.

COTTON.—*National City Record*: Mrs. Flora Kimball has a cotton plant growing in her garden that is seven years old and is never out of bloom or without bolls. The seed from which it grew was sent from Memphis from the common annual plant.

San Luis Obispo.

RED ASTRACHAN.—*Tribune*: At the Board of Trade rooms, Monday night, some apples of the Red Astrachan variety, from the orchard of Mr. E. Leedham, of Arroyo Grande, attracted great attention and keen appreciation. The fruit was beautiful in appearance, very large, uniform in size and shape, rich in color, and of fine flavor.

Santa Cruz.

RAMIE.—*Pajaronian*, Aug. 4: J. A. Hall, who is about to experiment with the ramie plant on his San Miguel canyon ranch, showed us yesterday samples of the ramie as grown, ready for manufacture, and manufactured into cloth. The latter is of fine texture, and fully warrants the praise it has received. We have a handkerchief made from ramie that is finer in texture than the ordinary linen article. Mr. Hall's experiments will be watched with interest.

ASPARAGUS.—Hy Jackson has, we believe, one of the oldest asparagus beds in the State. He planted it about 30 years ago, and it has continued to yield abundantly each year. Asparagus is a prolific and profitable vegetable when carefully cultivated. Wherever its cultivation has been attempted in this valley, it has been successful.

Solano.

EDITORS PRESS:—The weather is cool and pleasant, with damp nights, which are not good for drying fruit. A fire in the mountains west of Pleasant valley makes it very smoky. Three cars are waiting at Vacaville to start East tomorrow morning. They are loaded with peaches and grapes, mostly the latter. Not many peaches are going East from Vacaville nor to S. F., except to the canners. There will be quite a lot of white nectarines dried in Vacaville this year, for which 12 cents is offered. There have been so few nectarines dried before this year in the State, that there seems to be

no established price for them as there is for other dried fruit. There is much more acid in nectarines than in peaches or apricots. There will be a great many more peaches dried here than there were apricots. One man has contracted to dry 40 tons. Those who have large lots to dry are dipping them in lye. This process is much cheaper than paring. The lye costs about seven cents per pound by the case, and one pound of it is put in from two to five gallons of water. When boiling, the peaches are dipped in it and shaken in wire baskets until the skin comes off; then they are run through three different waters until as much of the lye is rinsed off as can well be. Next they are sulphured 15 minutes in the baskets; after cutting they are sulphured one hour and then dried. If dried in a drier they look very well, but if in the sun they turn pretty dark and all taste more or less of the lye, unless it is to a person's interest not to taste it.—G., *Vacaville*, Aug. 7th.

Sonoma.

CROPS CROWDING THE CANNERS.—*Petaluma Courier*, Aug. 3: The proprietors of the cannery want 150 extra hands. Tons and tons of ripe fruit are coming in daily, and without the people come to their assistance, much of it must go to waste. If your children are attending school, take them out for a few days until the rush is over. Two weeks will probably be sufficient. The same state of affairs seems to exist all over the coast wherever there is a cannery. They are a blessing to any community, and should not be allowed to suffer for want of help.

THE HOP-GROWERS.—*Santa Rosa Democrat*, Aug. 6: The most enthusiastic meeting of the Sonoma County Hop-growers' Association ever held, took place in this city Saturday afternoon. The members from the several districts reported promising indications [without exception. A number of new names were added to the membership roll. The rate for picking was fixed at one cent per pound. The average yield this year, it was generally conceded, would be between 1200 and 1400 pounds to the acre, owing to the large acreage of new vines coming into bearing. One-third of the total acreage of hops in the county, and that represented by the association, it was thought, were new vines; consequently a decrease in the average yield of 1800 pounds to the acre. The following officers for the ensuing year were elected: Guy E. Grosse, president; seven vice-presidents, as follows: A. Hanzel, Fulton district; J. P. Graham, Mark West; T. L. Ross, Green Valley; T. B. Miller, Olts Alley, and J. E. Hall, Santa Rosa; Lee Watson, Freestone; N. Winants, secretary; C. P. Farmer, treasurer. The acreage in hops represented by the association is 888.

Yolo.

BIG WHEAT SHIPMENT.—*Woodland Mail*, Aug. 4: One of the largest shipments of wheat that ever occurred in Yolo county took place yesterday, when E. T. Clowe shipped 1000 tons. He has been accumulating this enormous quantity of grain for many weeks, but owing to lack of cars has been unable to ship what he had purchased. Saturday evening a special train of 50 cars came up to Woodland with a large force of "sack-buckers," was run around to the warehouses, and the crew of 40 men set to work. Each car was loaded unusually heavily, 440 sacks of wheat being placed on each. About 6:30 last evening the last sack was placed aboard, the whistle blew, and the wheat left for Port Costa, whence in a few days it will doubtless be shipped to Europe.

HOG CHOLERA.—This dread disease is still prevalent in Gordon valley, and Chas. Hall has lost a large number of fine swine during the past week. The cholera appears to be spreading. Remedies innumerable are being published and forced upon the ranchers, but not one of them seems to be of material benefit to the hog, who dies in just as much agony after \$10 worth of cure is down his neck as if he had been left to himself.

A BATTUE OF GOPHERS.—*Woodland Mail*: Ex-Sheriff Beamer is nearly bankrupt over a little thoughtless speculation in gopher scalps. He is the happy possessor of five acres of fine alfalfa meadow. Last week he conceived the idea of flooding this pasture for the double purpose of benefiting the clover and exterminating gophers. To make the matter interesting, he placed a bounty of a nickel on scalps of the rodents, and told a neighbor's boy to do his best. The offer leaked out, and to his surprise a hundred boys were on hand for 24 hours, and when the slaughter ceased the ex-official's hair was several shades lighter, and his scalp-girdle contained 1307 souvenirs of the chase. He says the boys of Woodland have a corner on nickels now.

NEVADA.

AN IDEAL RANCH.—*Reno Gazette*, Aug. 6: On Hon. T. B. Rickey's ranch, in Antelope valley, there are employed 160 farm hands; there are in operation 12 mowing machines, which will have cut at the end of this season from 12,000 to 15,000 tons of alfalfa; there are 20 acres of garden stuff, from which a wagon-load is taken every morning to supply the tables—in fact everything done there is on a big scale. The ranch is 28 miles long, and along the road is ornamented with beautiful shade trees, while around the home are not only numerous shade trees, but fruit trees, lawns and beds of flowers. Our informant says that the Rickey ranch is about his ideal of Paradise.

The Dog and the Tramp.

A tramp went up to a cottage door
To beg for a couple o' dimes or more.

The cottage door was opened wide,
So he took a cautious look inside.

Then over his features there spread a grin
As he saw a lonely maid within—

A lonely maid within the gloom
Of the shadiest part of a shady room.

Into the room the tramping went;
Over a dog the maiden bent.

His eyes were set and full of fire,
And he viewed the tramp with evident ire.

"Run for your life!" the maiden cried;
"I clean forgot to have him tied!"

"Run for your life through yonder door—
I cannot hold him a minute more!"

Without a word he turned his face
And leaped the fence with careless grace;

Then lightly along the road he ran—
A very much-put-out young man.

The maiden loosed her bulldog's neck,
And gazed at the tramp—a vanishing speck.

And peal after peal of laughter rent
The air with the maiden's merriment.

The dog was of terra-cotta ware—
She won him that week at a lottery fair.

—Eva Best, in *Detroit Free Press*.

Notes From Hillside Haven.

[Written for the *RURAL PRESS* by M. E. O. W.]

Please may I take up my rag where I laid it down? But first, I have the happiness to relate that my precious old Mun Tung and Tang Eye are still with us, carrying their queues behind them, never once drunk; always faithful and true, plodding on with the never-ending jobs of ranch life, not shirking or stealing, or lying, just quietly delving. What a comfort it is to know that every animal has been fed; stable, sty and chicken-house cleaned; cows milked; everything done just as we taught them to do it, and no back talk either; and a nice hot breakfast served for ourselves, just on time to the very minute. Very many thanks for the pros and cons that my innocent paper in the long ago brought out on the "Heathen Chinese." I did not intend to stir anybody up, but was somewhat anxious lest a rabble of foreigners, called a committee, might visit our place at home and frighten off our help, when I could not stand up to help myself.

To the dear little woman who thinks she has found a hole in my soul! I would like to give some of our beautiful heartsease, pinks or sweet peas, and to say that in a big book that stands within reach, I have read, "Judge not that," etc., etc. I know it to be pretty good advice sometimes.

Home-Made Carpeting.

Now for the despised rags. We became the fortunate possessor of several pieces of bright, pretty Brussels carpeting, but not nice without a border or finish of some kind, so we thought and thought how it could be done. In days that are passed, when to travel more than to stay at home was our fate, the moths ruined a new "listing" domestic carpet, eating it all up under the large pieces of furniture. When carpet was again needed, we raveled out the listing, had it woven with more rags into a good new carpet. From the old raveled-out carpet were pounds of new-colored warp, cut in three pieces. Did not know what to do with it when it was put away. Concluded it must make a border—how, was the mystery. Necessity, that mother of invention, came to the rescue. Here is how it was done: The card that comes around packages from stores had been tied together and wound into balls; there were many of them, the savings of years. Two coarse knitting-needles were the implements. There were three colors of the warp, so we thought to stripe and scallop the border. Cast on 19 stitches; take two threads of the warp and knit into each stitch, leaving the loose ends all on one side of the piece, knitting back plain. The knitting back and forth is the same stitch. The scallops were made by casting on one stitch at the same end until 33 stitches were knit, making the width of the border; only every other row is widened; then slip and bind one stitch till there are the original 19 left. After a long time it was finished and put in place. Every one says it is not only useful but very pretty, too. It was not made in whole time—none of the housework time or practice or reading was given up; only just the moments when some one came in to chat a little or read aloud, or when we were

wholly incapacitated for anything else. The basket of strings was ready. There were four other much-needed rugs to make. It had taken so long to make the wide border that anything so elaborate could not be thought of. There was a bundle of worn-out red flannel underwear, positively worn out so that it was not good for carpet rags, yet there were little bits that were good. These were selected, cut into strips six inches long and half an inch wide. Three stitches were cast on the needle; knit first stitch plain, in the next a red rag, the last one plain, then turn knit back without a rag. I was so pleased with the rapidity with which I could manufacture border, that all the time that could be spared from the actual duties of the house were devoted to border. Within the week they were all finished and in use. If you doubt that they are nice and durable, come and I will show them. Five rugs so large and as good could not be purchased in San Francisco for \$20, so one round \$20 was credited to help pay for Bancroft's works. They are splendid. We have read 11 of the volumes and think we have our money's worth.

After the carpets and rugs were finished and all the good bits taken out to stuff hassocks and cushions with, there were seven sacks packed tight of rags that could not be used. A friend suggested a bonfire, but we sent them to the city as paper rags and received all they were worth in cash. We consider that the master stroke of the economy. If any woman reading this paper can make more things out of nothing than I can, I really hope she will write. I'd like to learn how to keep things nice and comfortable and not be too tired myself, and to have more time to study.

In the Garden.

The extreme hot spell of last month cut all the buds and flowers off the roses and made things look forlorn enough. We left the water running through the hose every night till thoroughly wet, and to-day, July 19th, there are 14 varieties with open roses and lots of buds of promise. Plenty of water gives many flowers, the flowers make one of the striking differences between my home and that of the aboriginal digger. We have to dig a good deal as well as water, but no words can express the comfort their bright faces and sweet fragrance bring, and such glorious evenings as we spend with the microscope looking at the wonders of pollen, spores and seeds, must be seen to be understood and appreciated.

Rutherford, Napa Co.

STUDY THE CHILDREN'S TASTES.—Each child has some one talent or gift. No matter how stupid he may appear, there is always one thing he can do better than others. It is for the parents to find out what this one gift is, and aid the child in bringing it out. If they observe carefully the tastes of the little ones they can easily determine for what each one is adapted. One is never so happy or contented as when drawing with pencil, on paper or slate, figures or landscapes, sometimes copied, but generally from the imagination. He does not weary of this work, as a child who only takes it up to simply pass away the time would, but spends hours at it, adding here and erasing there until the picture is done to his entire satisfaction. Some cardboard and a box of crayons would be a suitable birthday gift for this child. He will want very little amusement outside of his play beyond this. Another child is of a mechanical turn of mind. His pleasure seems to consist in repairing and making useful articles. He is continually working with hammer, chisel, etc. A box of carpenter's tools is what this child should have to make him perfectly contented with his home. Let them occasionally invite their friends to spend an evening with them, and you will be better able to judge and advise as to their company, as a well-mannered boy or girl guest is usually a safe companion for any child. They should be provided with books and games with which to entertain their visitors. It is wonderful how little will make children satisfied with their homes—simply a recognition of each individual taste.

THERE is nothing more injurious to children who are growing than to be hurried. Let them develop slowly and steadily, and they will be stronger in nerve and mind. The most enduring trees are those of slow growth. It is better to keep a child back in school rather than push him forward. Nervous diseases of the most obstinate and subtle type, which affect the whole life of the individual, are sometimes brought on by the injudicious forcing of the child. If the child seems given to day-dreams, let him be. His day-dreams may be only the means by which he will gain a higher life which no man or woman can gain until he has become conscious "of a certain stillness that pervades the universe like a law, ever being broken by the cries of eager men, yet ever closing and returning with a gentleness not to be repelled, seeking to unfold and penetrate with its own healing the minds of the noisy children of earth."

LOVE'S LABOR LOST.—He had taken her to hear Patti at \$7 a seat and afterward to Delmonico's, where the two together ate up \$9.75 worth. As he reached for his hat later that same night she said: "I am sorry, Mr. Simpson, if my refusal will cause you pain. I esteem you highly as an escort, and in that capacity I will always be a sister to you; but your wife I cannot be. You are too extravagant."—*New York Sun*.

Fly-Time.

[Written for the *RURAL PRESS* by DAGMAR MARIAGER.]

The spring poetry season has given place to that of fly-time, and many wives are on the verge of despair. Indeed, the common house-fly is responsible for many harsh words spoken to husband and children, many accidents, such as the spilling of hot soups, breaking of dishes, etc.; and it has harassed many poor women into nervous derangements or fevers, when none but the doctor and druggist were blown any good by the ill wind. The neat house-keeper and squeamish cook imagines she is the one lone victim of this winged and buzzing necessary evil; but, though she is the greatest one, there are others whose miseries may keep her company. A gentleman writes to me from the parched pastures of Arizona, where it seems the fly is proof against either drouth or sunstroke, and preserves his usual penchant for getting into things. My friend says:

"I'll tell you something of my experience in our restaurants the past three days; but if near your mealtime put my letter away, please, until you have eaten and digested your repast. I was having dinner at the Cobweb House. Among the different vegetable dishes was one with potatoes stewed in cream, out of which I picked seven able-bodied flies, well done. This naturally put me on the qui vive. I began to dissect everything on my plate critically. In my plum pie were three whole flies, and in the dressing of the roast beef were several, dismembered and mutilated in a shocking manner. The ice-cream, too, was peppered and salted with their legs and wings, while I found one body guillotined. Maybe the head had, like Cicero's, been sent to some dictator's wife, who, in her wanton cruelty, as did Antony's, ran a bodkin through its tongue and had it elevated upon a post to speak in death as eloquently, as it had buzzed in life, of the wrongs suffered at the hands of the stronger and the victors. Indeed, these flies speak to me more forcibly in death than in life; and I unshaken all these dead heroes in the most fashionable restaurant of T. I concluded to change, so the next day (yesterday) I had dinner at the next best place. As a prelude to my soup, I asked the waiter in case he had flies for dinner to bring them in on a separate plate, none of them to be soured, dismembered or disemboweled, or very well done. As I finished my soup, I congratulated myself upon the prospect of being able to make out a meal, when I broke open a biscuit and found in it a portion of a rat. To-day I have had dinner elsewhere again, and provided myself with a bottle of claret as a temporary help to my weak stomach, as I had nervous apprehensions as to what new species of horror I was doomed to suffer. My misgivings were not a fantasy of the brain. I felt more or less assurance against flies and rats, mostly because their presence had ceased to be a novelty. I felt that some new force was necessary to rout me from the dinner-table. I was armored against the two foes of the recent past. My nasal organ is not oversensitive, but it suffered a disturbance from some cause as the dinner was set before me. I smelled the butter, and, though far from sweet, it was unequal in strength to the task of emitting the odor, the fountain of which I was in search. I smelled the wine, the sugar, the salt, in vain. Then I discovered my neighbors to right, left, in front and behind me, similarly engaged. I began to doubt our sanity. Were we, stout and sturdy specimens of nature's noblemen, actually mimicking each other, like monkeys, without knowing for what? This was a new phase of evolution as deplorable as unheralded by our alert scientists. My neighbor in front suddenly turned pale. 'My God! smell that meat!' he exclaimed, as he struggled to his feet, fumbling in his pocket for the necessary 50 cents fine, with a view to a hasty departure. I followed him, and have two more restaurants to try in fear and trembling."

A MOTHERS' MEETING.—A leading worker says: "I had a surprise party yesterday, a surprise mothers' meeting, rather. A lady called on me day before yesterday asking me to address a few of the mothers of this city who were interested in social purity. I consented if they could come to my rooms, as I was so busy I felt as if I had not the time to go away far. This they were willing to do, and yesterday afternoon 93 mothers came upon me in a body to study the subject of social purity. I was surprised beyond measure, for these women represented a class not at all connected with the W. C. T. U., and I had no idea there were so many outside our own ranks interested in our work. Most of these will join with us in our W. C. T. U. mothers' meetings, I think, and eventually I hope we shall reach an attendance of several hundred at our monthly meetings."

DISCRIMINATION IN WORDS.—Pretty refers to external beauty on a small scale. Grace of manner is a natural gift; elegance implies cultivation. Well-bred is referable to general conduct rather than individual actions. Beautiful is the strongest word of its class, implying softness and delicacy in addition to everything that is in similar words. Courtesy has reference to others, politeness to ourselves. The former is a duty or privilege to others, the latter is behavior assumed from proper self-respect. Benevolent refers to the character of the agent

acting, beneficent to the act performed. Charitable is restricted to almsgiving, except when used in reference to judgment of others. Love is used only where there is something more than external beauty, where there is a combination of personal beauty and pleasing manner. Faultless features do not make a lady lovely who is disagreeable in disposition.—*Journal of Education*.

Raining Upside Down.

As all Anaheimers well know, from time to time water from the general reservoir is turned out of one distributing ditch into another. When the water is on, "the ditch" is a purling brook from two to three feet in depth and from four to five feet in width. When the water is off, it is simply a nice, clean, dry depression lined with fine warm sand.

A few evenings since, a big, unsophisticated traveling Irishman came upon one of those dry ditches. It was sundown, and thinking he had struck a capital camping place, the Emerald Islander spread his blankets in the sandy depression and composed himself for a good night's rest.

It happened to be the date when water was due in that particular ditch. It was turned on during the night, and toward morning, chilled and saturated, the tired traveler was awakened and astonished to find himself floundering in three feet of cold, swift-running water. His first thought was that a terrific rainstorm had occurred. But investigation dispelled the rain-storm idea. He had heard of waterspouts and opined that, perhaps, one of them had burst in the vicinity of his lodging place.

It was now daylight, and while the mystified Milesian stood on the bank of the swift-running ditch, shivering in his wet breeches, and pondering over the unaccountable problem, Hans Wengelsneller happened along, bound for Anaheim and daily toil. Hans is totally oblivious of the English language, and the Irishman was as totally oblivious of all others, so the following dialogue ensued:

Irishman—"Mornin to yer haner!"

Hans—"Yaw!"

Irishman—"Where the blazes did all this water cum from? Oim kilt an' drowned an' murder'd wid it!"

The man pointed to the flowing ditch as he spoke. Hans slowly comprehended what was requested and in answer undertook to explain the artesian system.

By a plentiful use of the German word "wasser," and by an apt manipulation of signs, reference to the ground and its depths, he succeeded in making the Hibernian understand that the water which had drowned him out came up from below—not down from above.

"Arrah g'wan now, d'ye think oim an omad-haun?" exclaimed the man with the wet breeches, and scornfully turning toward Anaheim he strode away, muttering as he did so: "Tear an ages, d'ye moind that. By the tail o' Moll Kelly's cat that devil av a Dutchman wud have me believe that it rains upside down in this country."—*Anaheim Gazette*.

NOVELTIES IN WOMEN'S WEAR.—The delicate gauze fancy pocket handkerchiefs worked in floss silk are the latest novelty in that line; they are tucked into the fronts of bodices, and also arranged in front of high-crowned hats, drawn upward and flanked on one side with tall loops of velvet. Small colored handkerchiefs in thin Indian silk, averaging about sixpence or eightpence each, are much used for display. Boxes containing six kinds are now given as presents, and useful and acceptable they are. Gauze or fine muslin parasols in black, white embroidered in black, gray and heliotrope, are novel, but cannot be said to be serviceable. Also net parasols, especially black over pink or heliotrope and others over gilded framework, semi-transparent. Black net hats over red crepe or gilded shapes are novelties; also muslin hats trimmed with ribbon, copied from the old Chinese kind worn by one's grandmother or her mother before her. The colors most in vogue in millinery are a rich red entitled "Ruddygore," Gobel in blue, commonly called goblin, and in reality electric blue of light shade, and "veille rose," which is crushed strawberry with a new name. The Gobel in blue is the most fashionable, and red is close on its heels.—*Court Journal*.

A COW AND A DOG-CART.—A farmer near Fresno has in his employ a German fresh from Vaterland, a very good fellow, but in matters pertaining to the ranch "too green for the cows to bite." The *Expositor* tells how he was lately commissioned to drive a dog-cart out to a neighboring ranch and lead a cow to pasture. He put a rope on the cow's horns, tied her to the dog cart, and then started for the horse, which was hitched about 50 yards off. By the time he got to the horse, the cow concluded to go back to the corral, and pulled on the rope as she turned around. This tipped the cart over and threw the cow between the thills, and a spectator says it was the prettiest steeple chase he ever saw, and the best cow time on record. The cow went through the corral fence and dispensed with the wheels of the dog-cart at that point, while the German was in full pursuit, and yelling in his native tongue, "Catch her by the horns!" No one seemed to be hunting for horns just then, and it was not until the cow had distributed the wreck of that cart around the premises that she quieted down.

Where?

Flooding with glory the sky in the west,
Then sinking behind the low hills' crest,
Where does the sun go for the night?
Does it drop in some ocean deep and dark,
That quenches its radiance spark by spark,
Leaving no shimmer of glory to mark
The track of the monarch of light?

Ah! well do we know that its reddened blaze
Lights the beautiful pearly morning rays
Of a day on the other side;
And that when the night shadows darkest lay,
Through the cool twilight of that other day,
It will come again to brighten our way
Till another eventide.

O souls beloved! after life's fitful day,
Passing out through the twilight gray,
Where dost thou go for the night?
Dost thou hasten away from a world like this
To a region of souls entranced in bliss,
Or art thou lost in some dark abyss—
Forever from mortal sight?

Ah! our hearts do know that thy passage from earth
Marks the early morning, the hour of birth,
Of a soul on the other side,
And that when our night shadows darkest seem,
Thou wilt come again with a softened beam,
And light in our stricken hearts, the gleam
Of a hope that will ever abide.

San Jose. MRS. E. O. S.

COMMON SENSE IN EMERGENCIES.—The story is told of Brunel, the eminent engineer, and builder of the Thames tunnel, that one day, while amusing a child with tricks of sleight of hand, he attempted one which resulted in a serious accident to himself, and at the same time illustrated the danger of playing pranks with the mouth. The trick consisted in adroitly concealing a half-sovereign in his mouth and pretending to bring it out at his ear. All at once to his dismay the coin slipped down into his gullet, and there stuck in spite of every effort, surgical or otherwise, to dislodge it. In this dilemma common sense came to the rescue. Brunel himself devised an apparatus to which he was strapped head downward, keeping his mouth open, when, to his inexpressible relief, the coin dropped from its dangerous position and rolled out upon the floor. A sword-swallower, who once lost a bayonet in his throat during one of his public performances, resorted to similar means for recovering it, and was equally successful.

FUSSY WIFE.—Now, Henry, will you see about those tickets? I know we'll get left! That train's going now, I'm sure! Look at the clock, will I? Nonsense, it's half an hour slow, likely as not. And, oh, where is my bag—have you seen it, Henry? In my hand, is it? Well, hurry, Henry, and attend to the baggage. No, I won't sit down—I'm too anxious. Come, make haste—go, for goodness sake! Henry! Henry! What is it? Why, you were leaving me here all alone, and I know we'd never find each other again. No, no, no! I won't go into the waiting-room! Just suppose we should hear the gong! Oh, why don't you get me a chair, Henry? I can't stand on my feet another minute. What are you staying here for? Those tickets! The trunks! And you haven't—there, you haven't—bought our Pullman seats. Run, Henry! Oh, come back a moment—come back! Henry! He's actually gone! Henry! Henry! Henry!—Puck.

A FARMER in Greenboro, Md., thinking to change his grade of potatoes, barreled all that he had, shipped them to Baltimore, and ordered a few barrels of extra fine Northern potatoes for seed. While barreling his own tubers he lost his spectacles. When he received his Northern seed potatoes he found his missing spectacles in one of the barrels. Such things destroy confidence.—*New York Sun.*

DAVID L. WIGHTMAN of Cleveland, a brave and tender soul, for whom the flags were at half-mast a few days ago, was wont to say: "In all my experience I have never met a man or woman, however degraded, in whom the spark of pure manhood or womanhood was entirely dead, and who would not in time respond, at least a little, to kindness."

To try to make others comfortable is the only way to get right comfortable ourselves, and that comes partly of not being able to think so much about ourselves when we are helping other people. For ourselves we always do pretty well, if we don't pay them too much attention.

A NAME.—Talk about the outlandish combination of letters in Western names, we do not see that New England has much reason to claim simplicity. In a Massachusetts paper we read: "The Katevauchenaug society circle held a lawn party recently, a large number being present."

HAPPY is the grown man or woman that can be a child again, and doubly happy the two people that can be children together. There is nothing in the world so refreshing or so apt to give patience to bear with grown-up trials later in the week as one day, or part of a day, given to being a youngster.

An authority on politeness affirms that the most distinguished manner of acknowledging thanks is by a "grateful and worshipful beaming of the eye."

YOUNG FOLKS' COLUMN.

A Stray Chicken.

(Written for the RURAL PRESS by AUNT SUSIE.)

Three little boys from the city who are spending their vacation on a ranch are just about as happy as boys can be. First one thing, then another, comes up to amuse them. One day I heard a great calling of "Aunt Susie, Aunt Susie, there is a hen in the straw on a nest."

So I went down to the corral, and to please the boys climbed the ladder to the loft of the wagon-shed, where the crisp, clean straw is kept, and sure enough there was a big Langshan hen sitting most contentedly on the straw. The boys, Stuart, Herbert and Romney, stood by while I crept up on the straw behind the hen. When I put my hand on her she did not appear to move, so I lifted her up and found—what do you think? One little chick as black as ink, all but a touch of white on the wings. I gave it to Romney, who is very fond of anything that creeps, crawls, flies or walks, even to little baby mice treasured carefully in his pockets! He carried the little chick and Herbert the hen, while Stuart and I brought up the rear of the procession.

And now I am afraid I shall be called very heartless, but it really didn't seem worth while to trouble to feed one little chick with its mother when I had two broods in coops, so I went to Mrs. Yellow-wing, who has a family of ten yellow chicks in a big coop inside a yard with a wire fence so we can watch them. I presented the lone, lorn black chick to her; but dear me! she was so cross, all her feathers stood out, and she scolded away with all her might, saying:

"What is that? surely not a chicken! Mine are all yellow with brown stripes down their backs. I stole my nest under the pigpen and laid all the eggs myself, so I could have a family to suit me, and that black thing with down on it can't come near my pretty yellow chickens; so there now, and if you don't take it away I'll peck its eyes out."

I saw it was no use to try to win any love for it from her, so I took it up, just in time to save it from being pecked as she threatened. Then I went over to Mrs. Black-wing and said to her: "Is this one of your chicks? It looks just like them, anyway," and put it down by her coop. She looked at it a moment, then said:

"I had 15 chicks and now have only 13. I thought two of them died, but one must have run away and has just come back. I stole my nest by the big hay-stack and all my chicks are black, as chickens should be, and glad enough I am they are not the pale-looking things I sometimes see. Chick-a-chick! chick-a-chick! come right here and eat your supper, and don't you run away again."

So the little chick ate its supper and cuddled under the hen's wings, and so was nice and warm, and never knew she was not her own mother.

I consoled myself for my seeming cruelty by thinking that if I had let the real mother have it in a few weeks she would be tired of it, go off and leave it, and even peck at it if it came near her.

The next morning Romney went down to see it, and came back with the cheerful news, "She is taking care of it."

The next morning Mrs. Yellow-wing was very sad. There in one end of her coop lay a yellow chick, cold and dead; it had a piece of green corn fodder in its bill; whether it was greedy and tried to eat too big a piece fast and got choked, or what was the matter, we shall never know. Mrs. Yellow-wing called and called, but of course it didn't get up. I took it away and said: "Now, Mrs. Yellow-wing, I am very sorry for you, but if you had taken the chicken I offered you the other night, you would still have 10."

"Yes, I know," she replied, "but really I couldn't. It was so black and mine are such a lovely yellow."

So you see each hen is perfectly satisfied with her family and thinks them just as pretty as can be. I hope they are good chicks, for that is better than to be pretty.

Well, these same three boys think it is fine fun to get the eggs every night. One lovely warm evening, after supper, I was handed a basket of eggs, all large and clean, some white and some coffee-colored, that the Langshan hens had laid. On top the basket was a letter addressed

AUNT SUSIE,
THE HOUSE.

I thought it was queer for hens to write a letter, but opened it, and found such a neatly written letter; and this is what I read:

THE CHICKEN YARD, July 28, 1887.
Aunt Susie:—We have done our best and laid exactly 41 eggs.
YOUR OWN HENS."

At the bottom of the page was a picture of a boy with a basket full of eggs, and around him were several hens and the big Langshan rooster; also on one side some nests with two or three eggs in each. To be sure, they stood up straight, and the ends were rather pointed; but altogether, I thought it a very nice letter for the hens to get up, and I wish I knew just which one wrote it, but I don't suppose I ever shall.

From One of Our Youngest Readers.

EDITORS PRESS:—My name is Leathy A. B. Vanderbilt. I live 12 miles from Williams, in the foothills. We had 1100 sacks of wheat and 69 sacks of barley.

Crops were pretty good around here this year. I have a sister 14 years old, and I am 8 years old. She and I have a Maltese cat. The two cats have seven kittens; two of them are Maltese. We have two old canary birds and have seven young birds. We have two old dogs and one puppy. We sleep out on the hay nights and the dogs go with us; the dogs go for night watch. One of our dogs is named "Nig," one "Dandy," the other "Barsto."

Williams, Cal.

GOOD HEALTH.

Infants in Hot Weather.

The baby is, or should be, the first thought and care in the household during the hot weeks of summer, and no work is of greater importance than attending to its wants and needs, since at an unheeded moment its health or life may be lost.

For the child dependent upon artificial food, cleanliness of the bottle, purity of the milk, and regulation of the time and amount of its meals, forms a routine of care which a mother is hardly less than wicked if she trusts to other hands than her own.

The woman who knows how to raise a calf or lamb, avoiding the evils of over-feeding, will, out of the goodness of her heart, stuff a little child till it dies of a species of starvation brought about by overworking the digestion.

Over-heating is another potent cause of sickness. Make the baby's bed just soft enough to yield a little to its tender body, and use a thin, small pillow for the head. Such a nest, in a cool, well-aired room, will insure quiet sleep through the midday heat, and then the child may be kept awake in the evening until the house is quiet and the air is cool.

The fevered condition of an infant sleeping half smothered in soft pillows, or within the heat of the kitchen, passes unnoticed by hurried mothers who heat their own blood with the exertion and hurry of their work. There are many rights we women claim and gain, one after another, but none should supplant the right to abstain from hard work and unhealthy surroundings during the early existence of our little children.—*N. E. Farmer.*

A CURE FOR DRUNKENNESS.—I was one of those unfortunates given to strong drink. It reduced me to degradation. I vowed and strove long and hard, but I seldom held victory over liquor long. I hated drunkenness, but still I drank. When I left off I felt a horrid want of something I must have or go distracted. I could neither eat, work nor sleep. I entered a reformatory and prayed for strength; still I must drink. I lived so for over 20 years; in that time I never abstained three months from hard drinking. At length I was sent to the House of Correction as a vagrant. If my family had been provided for I would have preferred to remain there, out of the way of liquor and of temptation. Explaining my affliction to a fellow-prisoner, a man of much education and experience, he advised me to make a drink of ground quassia, a half ounce steeped in a pint of vinegar, and to put a small teaspoonful of it in a little water, and drink it down every time the liquor thirst came upon me violently. I found it satisfied the cravings, and suffused a feeling of stimulation and strength. When I was discharged I continued this cure, and persevered until the thirst was conquered. For two years I have not tasted liquor, and I have no desire for it. Lately, to try my strength, I have handled and smelt whisky, but I have no temptation to take it. I give this for the consideration of the unfortunate, several of whom I know have recovered by the same means which I no longer require to use.—*Connecticut Home.*

MEDICAL ELECTRICITY.—Electricity is now being employed at two establishments in Paris for the treatment of disease. In one of these, conducted by Dr. Vigoureux (the head electrician of La Salpetriere), there is a gas engine driving a dynamo machine, the current from which is led to a number of small electromotors. These are used to work electrostatic induction machines, which are of English make, and the electricity generated is applied to the patients sitting in insulated chairs. The advantage of induction machines over the old-fashioned frictional machines is that they can work at a moment's notice and in all states of the weather. A similar installation is in use at La Salpetriere.

A CURE FOR FRECKLES.—The *American Practitioner* gives the following process as a means for removing freckles: The skin being washed and dried is put on the stretch with two fingers of the left hand, and a drop of carbolic acid is applied exactly over the patch. When it dries the operation is completed. The skin becomes white, and the slight sensation of burning disappears in a few minutes. The thin crust which forms after the cauterization should not be disturbed; it detaches itself spontaneously in eight or ten days, leaving a rosy coloration which is soon replaced by the normal color of the skin.

DOMESTIC ECONOMY.

WHAT TO DO WITH TRIPE.—This is a very delicate dish when properly prepared, and one of the most easily digested. It can be eaten with impunity by dyspeptics, I am told, and yet in many families it is never used. After emptying and thoroughly washing the beef's stomach, cover it with salt and put it in salted water. Let it stand five or six days, changing the water each day; then cut into convenient pieces and thoroughly scrape the whole. By this time the dark coating can all be removed and the tripe should be very white and clean. Next boil it several hours, or until it is so tender that a straw can penetrate it, when it is ready for use. If for pickling, put it into a jar of spiced vinegar. If liked broiled, cut it in pieces four or five inches square, lay it on a greased gridiron and broil quickly; season with pepper, salt and butter, like beefsteak. Stewing is another mode of cooking tripe. Cut it into small pieces of two or three inches, slice three or four small onions; put over the tripe and onions a little warm water. Let it cook slowly until both are tender and the water nearly boiled away. Then add milk sufficient to make a good gravy, a tablespoonful butter made smooth in as much or more flour; salt and pepper to taste. When the milk boils up thick, it is done. Still another mode is to fry it. Roll the boiled tripe, cut in squares, in egg, then in cracker crumbs, and fry to a nice brown. A sauce containing a little flavor of onion and tomato catsup may improve it.—*Exchange.*

RASPBERRY JELLY.—Crush the raspberries and strain them through a wet cloth. Put the juice into a preserving pan with three-quarters of a pound of hot, but not burnt, sugar, to one pound of juice; boil it ten minutes and take care that it does not darken; remove the pan off the fire, strain the juice through a bag and pour it into pots. Do not touch the bag until all the jelly has passed through, else it may become thick.

CAULIFLOWER SOUP.—Take two quarts of the clear soup, separate a small head of cauliflower into very small sprigs, have an inch of stalk to each sprig; wash them and put these sprigs into fast-boiling salted water, boil ten minutes, drain at once, and drop them into cold water. This is to keep them white. The clear soup must be heated to the boiling point, and the cauliflower dropped into it just before serving.

LEMON PIE.—The grated rind and juice of two lemons, to which add four eggs (reserving the whites of two) beaten with two cups of sugar and one tablespoonful of butter. Then take two tablespoonfuls of flour, mixed with a little water, add to it one cup of water and stir into it the other ingredients. The whites of the two eggs beaten with two tablespoonfuls of sugar frost the tops. This makes two pies.

CHARLOTTE RUSSE.—Take two pints of rich milk, and soak three-quarters of a package of gelatine in it. Make a custard of a quart of milk, one pound of sugar and the yolks of eight eggs, add the gelatine and two teaspoonfuls of extract of vanilla. When it begins to congeal, stir in it a quart of rich cream whipped to a froth. Line a mold with stale sponge cake; set on ice.

CREAM COOKIES.—One cup sour cream, one cup sugar, one teaspoonful soda and one of cream tartar, with a teaspoonful lemon juice, a very little grated nutmeg, and two tablespoonfuls caraway seed. Mix lightly, and roll out as soft as possible, using just flour enough to keep them from sticking to the board.

SPONGE CAKE.—Three eggs well beaten, one and one-half cups of sugar, one teaspoonful of cream of tartar in one cup sifted flour. Dissolve one-half teaspoonful soda in one-half cup cold water, add one cup flour; beat each thin after putting in one minute. Flavor with lemon. Bake in a moderate oven.

APPLE TAPIOCA PUDDING.—Soak a small cup of tapioca for a few hours in warm water, pare six or eight good apples, core them whole, fill the cavities with sugar, a little butter, grated nutmeg or liquid flavoring, pour the mixture round the apples and bake an hour. Sauce, sweet cream and sugar.

HARD SAUCE.—One large cup of powdered sugar whipped to a cream with two tablespoonfuls of butter, one spoonful of currant jelly beaten in well, and as much cinnamon as will lie on a half-dime. When mixed, heap on a saucer or glass dish, and set in a cool place to harden.

EGG OMELET.—One pint rich sweet cream, three tablespoonfuls flour, three eggs well beaten, half tablespoonful salt and pepper. Stir flour and milk smooth, add the eggs. Melt a large spoonful butter in a baking-pan, pour in and bake 20 minutes.

CORN CAKE.—Two cups of Indian meal, two cups of cold water or milk, one-half cup of flour, one-half cup sugar, one egg, two teaspoonfuls cream of tartar, one teaspoonful of soda.

MEAT BALLS.—Take cold roast beef and chop fine, season with salt, pepper and sage, put in one egg, make into little balls and fry in butter or drippings.

The Week.

The sensation of last week in the grain market has continued, though in more subdued form. The Call Board has not yet reopened and promises to remain closed until it fortifies itself with some new rules. People who know the affair from the inside say there is still a possibility of injury to some and that the situation has not altogether cleared, although there is little likelihood of sensational occurrences. There does not appear any prospect of serious drop in values, as there is too much interest still remaining in upholding them. The farmers have, however, already skimmed off nearly all the cream there is in it for them, and if they do not get down into the skim milk they will have no reason to complain.

The country is full of activity, and all who desire employment can now easily get it in the fruit regions. Some fruit is being lost because

canners and driers cannot handle it as fast as it ripens, although the towns are drummed for fingers to split and spread and fill. The output of canned and dried fruit this year will be enormous, and bids fair to be of a much higher average quality than ever before. The market for it is brisk, the fruit in many cases being bought before it feels the steam of the cannery or the hot air of the evaporator. Such quick work must spread abroad prosperity and comfort. Californians do not have to live on climate alone.

Beet Sugar.

It is now announced that the revival of sugar-making at Alvarado is assured and that ground has been broken for a fine establishment—with a capacity equal to any in Europe, one reporter says. The buildings are now in course of construction. We are glad of it, as we have said before. We have admired the pluck with which the Dyers and their associates have clung to the idea of beet sugar in California, the skill with which they have proceeded to demonstrate success with inadequate appliances, their inventive genius in devising improved processes for economical manufacture, and we are glad they are to have a well-equipped establishment. The beet-growers of Southern Alameda will also be willing to replant their fields with so profitable a crop. The Watsonville enterprise is still talked of. The beets sent from Fresno for investigation by Prof. Hilgard are showing good points and in all probability another week will bring a full report concerning them. Interest in the subject is also arising in other parts of the State.

Sorghum as a source of sugar does not seem to be making much advance. It is telegraphed from New York that at a meeting of the American Agricultural Association held in that city on Tuesday of this week, a paper which commanded absorbing interest was one by Prof. Wylie on "Sorghum as a Sugar-Producing Plant." Experience taught him, he said, that it was undesirable. Dr. C. V. Riley, United States Entomologist of Washington, agreed with Prof. Wylie. Mr. K. Torrence, a Japanese gentleman, commissioned to study agriculture in this country by his Government, said that an experiment of producing sugar from sorghum was unsuccessfully tried in Japan.

Ever since Prof. Wylie's visit to California and study of the growth and sugar quality of the beet as produced here, he has looked upon sorghum with less favor. There certainly does not appear to be much advantage in sorghum for California, except it be for syrup-making for local consumption and sale. For great enterprises which can command capital, the beet seems to be much the better material, and with our soil for growing and our climate, which renders storage unnecessary and gives a long working season, there is only the question of producing cheaply enough to set any bounds to a vast production of beet sugar here. Even this last question it is believed will disappear when we have the best machinery and employ the latest processes invented here.

SILK CULTURE.—It is announced that Mr. Neumann, our pioneer silk-grower, has a fine large colony of silkworms now approaching their last stages in Sonoma valley. Sonoma has a good supply of mulberry trees, and the people will be glad to turn them to account. The State Board of Silk Culture, at its rooms in this city, is progressing well with its work, and the station at Piedmont, now in charge of the Ladies' Silk Culture Society, is also at work in its line. A large number of small growers here and there in the State still find something in the industry. It goes rather slowly, it must be acknowledged, but there may yet be something great in silk. Importation of foreign silk continues. Only last week there were considerable arrivals of Chinese silk which went at once overland. But silk is made with very cheap labor, and so long as our women and girls who want work can earn ten times as much at something else, they will be slow to contest the silk business with the Asiatic. Still the industry remains as a possible means of turning to good account leisure hours at home, and, as we have said, much may yet come of it.

THE First District Agricultural Association Fair will be held this year at the Bay District track, in San Francisco, instead of at Oakland as heretofore.

Vegetables and Fruit for the East.

Since we wrote our last poem on the shipping quality of the spud and the cabbage-head, shippers of these delicacies have been busy, and the tonnage for the present season will roll up some very large figures. Never before, it is said, have vegetables gone East in such quantities as this season. Shipments during June and July are said to have reached ten million pounds, onions and cabbages being the chief articles; but beets, turnips, carrots and summer squash have also gone in large quantities. Potatoes have been shipped, upward of 100 carloads, it is said, and have yielded good prices, arriving some weeks ahead of the product of the truck farms of the South. Our potatoes are naturally commending themselves to the people across the mountains by their quality. We are not surprised at that, because we have always claimed their superiority. The towns to which California vegetables are now sent in greatest quantity are Chicago, St. Joseph, Omaha, Denver, Atchison and Kansas City. Denver is getting a great many carloads.

We are glad of this movement. If it continues, as there is every prospect, it will ennoble the business of truck-farming in this State. So long as vegetable-growing is for the purpose of producing something to be hauled about in wagons, or packed about in baskets, the business will remain with the immigrants from the shores of the Mediterranean and the China sea; but when the produce begins to move freely in cars, the California horticulturist is sure to turn from his trees somewhat and figure what he can make himself from his moister lands. Truck-farming is a nice, clean business, and it is worthy the attention of our most enterprising people. If the market is assured, it will not be long before the mattock of the foreigner will be supplanted by the best cultivators and quick-stepping teams of the American, and then we shall see the ground pour forth its roots and herbs in some sort of style. There is something in it; let the enterprising producer keep one eye on the vegetable side of horticulture, and when he thinks he sees a point write for the *RURAL*, and give us all the benefit of it.

Turning again to the old theme, our fruit at the East, we would note a brief call the other day from R. B. Blowers, who returned a few days ago from his good work at the East. His conversation approves what we have had of his observations by mail and telegraph. He fully believes the marketing of California is on a better basis through the auction method than it has ever been before, and he believes also in the prospect of disposing of vast amounts of fruits at remunerative rates. He shows his belief by taking his own physis, and we should not be surprised if he would ship more grapes than he can grow himself this season. Our market reports this week give a very interesting group of dispatches from the main points where California fruits are being largely sold, and the grower can follow the course of the week's trade quite satisfactorily. Some of the advantages of the auction plan, as experiments so far have disclosed them, are enumerated in the *Record-Union* of August 10th as follows:

The complete success of the auction system of disposing of California fruits in New York is causing for a great deal of congratulation among fruit-growers and the citizens who labored so diligently to secure a trial of the method. Six carloads of California deciduous fruits, seven days from Sacramento, were sold at auction in New York within 20 minutes after the sale began, on the 8th inst. The prices realized were good for all the well-conditioned fruit. The system proves to be the most direct and certain yet tried. A strong point in its favor is the guarantee it gives every grower and shipper that their consignments have an equal "show" in the market with all other consignments. Still another is that the returns are open to the fruit seller, and he is not required to trust implicitly to the reports of sales by middlemen and a host of sub-middlemen, which, if false, the shipper seldom has any possible means of detecting. The public sale by auction absolutely removes the opportunity for cheating, for the publicity of the matter is complete and of instant record. It is a very different thing to the fruit-grower to learn within 24 hours after sale just what his shipment has brought, and waiting three months for returns, with no possibility of knowing what they will be. Under the auction system, the fruit-grower cannot be put off with the old story that his goods arrived in bad condition. If they do so arrive, there are hundreds of witnesses to the fact.

Mr. Blowers gave us some of the reports of

sale which are issued immediately after the event. They give the name of the shipper, the amount and kind of fruit and the price. There seems to be no chance for deception in the record. Fruit trains are now moving eastward frequently, and the shipments for the year will undoubtedly be very large.

FREIGHTS ON WOOL.—Wool-dealers in Oregon who have been buying with a certain overland rate in mind, and growers who have not yet sold their clip, are much put out by an unannounced increase of rates by the Union Pacific. They appeal to the Interstate Commerce Commission that no notice of 10 days of increase was made as the law requires. The grievance seems to be in other matters as well as in rates. It is stated that the new classification makes no distinction between wool in sacks and in bales, which operates, it is charged, as a discrimination against the petitioners. The new tariff, it is said, bears the date of May 14th, and purports to go into effect May 25th; but, as a matter of fact, it is charged that the tariff was not printed until May 23d, and was not posted or in any way made known to shippers until June 1st. Complainants place the amount of their damage at \$5000. They petition for redress. This complaint is accompanied by a petition bearing the signatures of 37 firms and individuals, each controlling between 100 to 160 sheep, asking for speedy action upon the complaint, declaring their familiarity with the facts set forth and their opinion that such discriminations are disadvantageous to the entire wool-growing interests of Eastern Oregon.

FOR THE STATE FAIR.—Preparations are going forward for the State Fair, which will open September 12th. Some counties are making excellent arrangements for competition under the county premium award. At the meeting of the Board of Directors held in Sacramento last week, matters, chiefly relating to the fair grounds, were advanced. There will also be some changes in the pavilion which will add to the comfort of exhibitors and visitors. So far as we can learn, there is a prospect for an unusually good display this year in all departments. We trust to present the facts more in detail in another issue.

QUERIES AND REPLIES.

Two Plums From Japan.

EDITORS PRESS:—By this mail I send you a box containing samples of the Blood plum of Satsuma, the first tree of which was obtained at great expense a year ago last winter. This fruit being the first of the kind ever grown in America, you will no doubt be interested in examining it. I will add that it is nearly six weeks earlier than the Kelsey, firm fleshed as you will see, much larger, of better quality, color and form, it is an early and enormous bearer, and the trees grow with more vigor than any of the other 43 varieties of Japan plums which I have fruited here. The seed also is the smallest yet seen.

The two smaller plums grow on a tree imported at the same time from the same place. This also seems to be very promising, being so large, firm and sweet. A well-known Sacramento nurseryman of long experience pronounces them the two best flavored and most promising Japan plums ever introduced.

The plums I send have been picked a week.
Santa Rosa.

LUTHER BURBANK.

These fruits are exceedingly interesting. The first mentioned is the larger. The specimens sent are almost globular, being 6½ inches around horizontally and 6½ inches around vertically—thus a shade broader than deep. The color is dark red, almost solid color except a slightly lighter shade in the suture. The bloom is thin and of a lilac shade. The flesh is dark red—solid color from skin to pit, firm, rather juicy and of good flavor. Pit very small; ¾ by ½ inch.

The smaller plum mentioned by Mr. Burbank is also almost globular, being 5½ inches around horizontally and 5½ inches around vertically; rich cherry red, slightly mottled with yellow and freely dotted with same tint; flesh deep yellow, juicy, very sweet and of fine somewhat peculiar but very agreeable flavor. The pit is also very small; ¾ by a shade over ½ inch.

It seems to us these plums are very desirable. The smallness of the pits of the true Japanese varieties is striking. A plum 2½ inches in diameter with a pit but half an inch is a point of notice and value. We should advise Mr. Burbank to multiply his stock of these varieties.

FOREST FIRES are raging in the drought-stricken districts of Wisconsin and Northern Illinois, and the destruction and discouragement are woful.

IN seven years a Michigan farmer has had seven horses killed by lightning.

The Herefords.

The chain of the fairs will open next week with the display at the fair grounds and in the pavilion at San Jose. This is the result of a union movement between the District Association and the Horticultural Hall Association, and we think it wiser to combine upon one grand comprehensive effort than to attempt two exhibitions. The fall months are so full of fairs that it would be difficult for fair-goers from the outside to make two visits to the Garden City. Coming first, too, in the series, the San Jose display should be a grand success, as such events commonly are there, and thus strike the keynote of a successful circuit.

Though San Jose is so famous for fruits and horticulture generally, the district is also high in live-stock circles, and we trust will always be able to keep her animal interest as a worthy associate of her fruit enterprises. The district has a good representation of the different breeds, and in some lines has the largest collections of good animals. It may be expected that the fair grounds next week will delight all who enjoy fine stock either in the stalls or on the track.

As pertinent to the live-stock department of the fairs, we give on this page a fine picture of a handsome thoroughbred Hereford cow, "Countess," owned by the Indiana Blooded Stock Company at the time the portrait was taken. Herefords have been multiplying in California during the year since the last fairs, and it is likely that the display may include rather more of them this year than usual. The largest importation, we believe, has been that of Albert Gallatin for his Tehama county property. Whether these animals will drift as far south as San Jose we do not know, but

doubtless they will appear in force at the State Fair. At any rate there are good Herefords not far from San Jose, and in fact they have secured quite a distribution through the State. They are, of course, distinctively beef cattle. They are very potent in fixing their form and markings when crossed with common cattle, and now that it is likely that our beef interest will advance, not upon the range but upon the farm idea, and perhaps will give stall-feeders better encouragement than they have had hitherto, it is quite important that our general farmers should possess themselves of good improved beef blood of some kind. Our growth in population, our increase in wealth and other items of progress are morally certain to stimulate our animal interests, and, we trust, reward progressive breeders better than they have been rewarded during the last decade. It would be quite pleasant all around to have our live-stock resources "boom" a little after their long period of quiet.

I. V. H. SAFFORD, lately murdered at his home near Willows by a cowardly and brutal hired man, was one of our old subscribers and highly esteemed in the community where he lived as an intelligent, sober, peaceable and industrious citizen. He was in San Francisco last month, and we enjoyed a friendly call from him but a few days before his tragical and cruel death.

IRRIGATION.—It is announced that the irrigation movement in Stanislaus is gaining ground, and that those who opposed it are withdrawing their opposition.

Premiums for Orchards.

We take great interest in the enterprise of the Tehama County Board of Trade in offering premiums, to be competed for by orchard planters, who shall set trees within the limits of the county during the season of 1887-8, according to the terms set forth. It seems to us that other counties could follow the lead of Tehama in this matter, and so we print in full the announcement which is made:

ROOMS OF TEHAMA COUNTY
BOARD OF TRADE.
RED BLUFF, July 30, 1887.

On motion, the following report of Committee on Premiums was unanimously adopted:

The Board of Trade of Tehama county offer the following prizes, to be competed for by any resident of Tehama county:

\$750 for the best 500 orange trees.
\$300 for the best 1000 pear trees.
\$100 for the second best 1000 pear trees.
\$300 for the best 1000 prune trees.
\$100 for the second best 1000 prune trees.
\$300 for the best 1000 almond trees.
\$100 for the second best 1000 almond trees.
\$300 for the best ten acres of grape vines, foreign.
\$100 for the second best 10 acres of grape vines, foreign.

the trees have had, into the care from sunburn or insects, into their ability to hold up a good crop of fruit, and a dozen other matters in orchard-making which only a man who is thoroughly informed in the art can secure. This effort will then lead the competing planters to every exertion to inform themselves, to understand the local conditions under which they work, and the result will be a spreading abroad of horticultural wisdom which would not be sought except under the spur of competition. Our Tehama friends have done very wisely. We hope there will be a large list of competitors, and when we go to Tehama to see those young orchards, as we certainly shall if we live until the time for the awards, we shall expect to see collections of trees which cannot be beaten in the State. The fact of the competition will attract horticulturists from all parts of the State, and, if we mistake not, this one enterprise of the Board of Trade will bring hundreds of appreciative visitors to the county.

COMBINED HARVESTER TRIAL.—At the meet-

Land Matters.

Reports from Washington include some notes of general interest about proceedings in the General Land office. One thing is a ruling by Gen. Sparks, that absence of a settler from his claim because of drouth or other climatal behavior, which makes it impossible to live upon it, does not operate against his rights. Gen. Sparks says: "Settlers who are obliged to leave their claims on account of drouth should be prepared to account for their absence from this cause when they make final proof; but in such cases proof should not be offered until the law has been fully complied with, after their return to the land. An enforced absence on account of climatal reasons will not imperil their claim if the fact is established when proof is made, and if proof is not attempted to be made in advance of the time when the residence and improvement and cultivation required by law can be satisfactorily shown."

Gen. Sparks is evidently set against efforts of railways to secure money for land to which they have only shadowy claims. In a case now pending in San Bernardino county, the defendant appealed to the Land Office and the Commissioner, according to a dispatch to the *Chronicle*, declared that suits by the railroad companies, brought for the purpose of extorting compromise and securing payment for land to which the companies have no shadow of right or lawful claim, are, in his judgment, in the nature of blackmail or malicious persecution, for which a criminal action will probably lie against the agents of the companies, and he advises that settlers consult competent counsel, and avail themselves of all the remedies the law affords. In the event that this case goes to the Supreme Court,

the Commissioner states that he will consider the propriety of requesting the Attorney-General to intercede in behalf of the United States.

But all reports from Washington do not favor Mr. Sparks. This might be expected, for the most violent opposition is visited upon him by many whose evil games he has thwarted. Whether his position in the case which follows is correctly represented, or whether he is covertly attacked by one of his opponents through the dispatches, we do not know. The matter is relating to the rights of married women to enter upon timber lands. It is said that Gen. Sparks has decided against the claim of a lady who has taken up timber land in Humboldt county, California, and there are 40 other cases depending upon the final decision in this case.

It has already been settled that married women may make a homestead entry, and while the law officers of the Department, relying upon one precedent, have been generally denying the right of pre-emption to married women, it seems to be pretty well settled that it will be decided in favor of their right to make sub-entries when the coming cases are disposed of. It is claimed that the Secretary of the Interior will decide against Gen. Sparks on the rights of women in Government land.

CHOICE city real estate in Los Angeles has reached \$3000 per foot; in San Bernardino \$1100 per foot; in Riverside \$500 per front foot.

THE Japanese parties who were in Petaluma last year buying horses are there again—this time to purchase cattle.

THOROUGHbred HEREFORD COW "COUNTESS."

\$200 for the best kept orchard of not less than 10 acres of any age.

\$100 for the second best kept orchard of not less than 10 acres, of any age.

\$200 for the best kept 10 acres of vines, any age.

\$100 for the second best kept 10 acres of vines, any age.

The conditions of all the above offers are as follows:

The plant of all the above to be made during the season of 1887 and 1888, subsequent to this date and prior to the first day of April, 1888.

The examination and award to be made by not less than three competent judges of such products, to be selected by the Board of Trade, and to be non-residents of Tehama county.

Examination and award to be made between the 1st and 15th of May, 1889. Prizes to be paid June 1, 1889. Parties desiring to compete must make entry with the Secretary of the Board of Trade on or before May 1, 1888.

The Board of Trade also offer to pay for the best pear, prune or almond orchard, fee simple title, at the rate of \$200 per acre, on the first day of May, 1890. The planter to properly care for and cultivate the same until that time.—BRUCE B. LEE, G. W. WESTLAKE, M. R. HOOK, Committee. By order of the Board, G. W. JEFFRESS, Secretary.

Such an offer as this is far-reaching in its influence and effects. Obviously it will tend to the development of the county, and that is a good thing in a general way, and perhaps is the main aim in making the offers. It pleases us to think rather of the stimulus which the contest will give to the art of horticulture in the county. Every one who enters for an award will understand that to win it he must most fully inform himself upon every item of tree-planting, cultivation, pruning, or else he will have a poor chance of success. The idea is to get the most valuable commercial orchard, and a committee of experts in fruit-growing will not be satisfied merely with great growth. They will make careful examination into the training

ing of the State Board of Agriculture last week it was decided that the committee on combined harvesters, consisting of Messrs. Hancock, Green, La Rue, Singletary and Chase, should meet in Stockton prepared to go into the field at 6 A. M. Thursday, August 11th, to view machines at work in the field. The place selected was Sargent Bros.' farm, where there is an abundance of grain for all machines that wish to enter the contest. The committee desire to make a most complete test and have selected a place where they may be tested, not only in average, but also in the heaviest down and weedy grain. We hope there will be a general disposition to enter for the contest as far as possible. Their report will be made during the State Fair.

FRUIT PITS FOR FUEL.—A reporter for the *Fresno Expositor* was lately shown through G. W. Meade & Co.'s drying works, where they were handling about 50 tons of peaches and nectarines a day. He wondered what disposition was made of the enormous amount of fruit pits that must accumulate in an establishment of this kind. But few were to be seen, and upon inquiry he learned that the pits were thrown out in the sun and after they became dry were used in the engine for fuel. They are said to be almost as good fuel as coal.

JAR SUPERSEDING CAN.—The *Farmer* mentions that Supt. Pratt of the Sutter cannery has been testing jars in putting up the fruit, and expects to use them extensively, as they show the fruit to advantage and are a vast improvement on the cans.

THE DAIRY.

Failure in Butter-Making.

The cause of the failure in butter-making is given by the *Farmers' Advocate* of Ontario as follows:

1. The Fodder Flavors.—These are too well known to require description; but the feed also exercises an influence on the composition of the butter, which influences the durability as well as the taste.

2. Stable Taints.—Some people call it the "flavor of the cow's tail." This flavor arises from a lack of cleanliness in milking, the neglect of cleaning the udder before milking, and imperfect straining of the milk. Without doubt it is the effete matter from the body of the cow that gives the butter this peculiar flavor, which is intensified by allowing the milk to remain in the stable atmosphere for an unnecessary length of time.

3. Smoky, Musty Flavor.—This condition has its origin in the setting of the milk or cream in an impure atmosphere, principally allowing the cream to sour in dwelling-rooms, where all sorts of necessary and unnecessary flavors are given off, and in erecting the milk or cream cellars in the neighborhood of stables or other places where all sorts of miasmatic or other obnoxious effluvia are given off, especially in summer.

4. Oily (sour oily) Butter.—According to all accurately conducted experiments, this mistake is entirely due to mismanagement in souring the cream. It is especially noticeable when, in order to sour the cream, old cream or sour buttermilk has been added. In all probability, the decomposition of milk sugar into lactic acid, in such cases, takes place in an abnormal manner. Factories in which the above method of souring the cream had been employed produced a very oily butter; but this condition disappeared when the souring process was changed by using fresh sour whole milk.

5. Greasy Butter.—The condition takes place after the butter has been stored for some time, when it partakes of a tallowy or lardy flavor. At the same time the color changes white and tallow-like, particularly from the covering into the interior, which can also be observed when the butter is placed in the sun for some time. The cause of this failure probably lies in souring the cream too much, by which the decomposition of the caseine and the butter fat is already far advanced, only to be afterward still further increased. The white color is probably due to this advanced decomposition of free fatty acids, which, in their turn, produce a change in the butter fat. Careful observation of the souring process, and scrupulous cleanliness with all the milk vessels, are the means of preventing this undesirable result.

6. Fishy, blubbery butter is a failure observed in old samples. The fodder may play a part in the production of such butter, such, for example, as the feeding of large quantities of oil cake, which changes fine butter into that of a blubbery nature; but it is also very probable that this failure is caused chiefly by the improper handling of the milk and cream, the former not being kept fully sweet, while the cream is rising, or being too strongly soured; principally, however, on account of faulty methods of souring the cream. The same remarks apply here as in the case of tallowy butter.

7. Bitter butter is partly caused by a bitter taste in the milk, which is particularly the case with the milk from cows a good while after calving, but it is also caused in part by certain substance in the fodder, such as sometimes found in lupine, also by spoiled foods, and by changes from stall to pasture feeding, or pasture to stall feeding. It is also highly probable that bitter butter can be produced by mismanagement of the milk and cream.

8. Speckled, Streaky Butter.—In colored butter this is caused by the coloring not being evenly distributed, the butter being interspersed with lighter and darker shades, but the cause also lies in imperfect salting or working. When the salt is not worked evenly the percentage of water varies in different parts of the butter, the salt drawing moisture from the surrounding parts in order to be dissolved. The parts having the greatest quantity of water have a darker appearance than those with a lesser quantity, which causes the appearance above mentioned.

9. Moldy Butter.—This takes place soon after the butter is packed, and is caused by a fungus, which, however, can easily be removed, but a disagreeable taste is imparted to the rest of the butter. During the life of the fungus the butter undergoes decomposition, and sooner or later propagates itself over the contents of the firkin. Keeping the tub moist before and after packing is said to be the cause of the failure.

10. Rancid Butter.—This is the most commonly known of all the failures in butter-making. The rancidity originates in the butter which is in contact with the wood of the tub, and spreads into the interior until the whole contents of the firkin is spoiled. The progress can easily be ascertained from time to time by the butter tester. It was at first supposed that the rancidity of butter was caused by its coming in contact with the staves of tubs, it being believed that the butter would absorb some substance from the wood that would give it this flavor. The spoiling was therefore attributed

entirely to the mismanagement in the preparation of the tubs. Undoubtedly a bad tub may favor rancidity, but it is not the only cause, the quality of the butter having considerable to do with it. A good quality either never becomes rancid, or at any rate is much less liable to do so than an inferior article, and therefore, here also, care in the production is the best way to guard against this failure. The fact that the rancidity commences at the outside is due to air coming in contact with it there and decomposing it, or at any rate causing free butyric acid to be formed. Carefully soaking and drying the tubs and thoroughly sprinkling the sides with salt before packing the butter and then storing it in a dry, cool place, are good safeguards against this failure.

Banning Notes.

EDITORS PRESS:—Banning enjoys increasing prosperity each year. Our orchards and vineyards are gradually coming into bearing and are producing grand successes. J. W. Davis shipped some 22 tons of blackberries from his 10-acre ranch. Prices paid for these berries were from five to eight cents per pound at Banning depot. Mr. Davis' vines are three years old. The berries were remarkably large and rich in flavor.

W. H. Yerington has also sold a fine crop of blackberries from vines only one year old. In fact all the blackberry ranches here have paid handsomely this year.

Mr. Hargrave is now picking and shipping the third crop of strawberries this season. We consider three successive crops from the same vines pretty good.

Mr. Harry Ingelow has a splendid patch of red raspberries, which has proved both prolific and profitable. All our people who have engaged in raising small fruits have made money. This climate is well adapted to their growth, and our water supply amply sufficient.

The apricot crop was fairly good. Some small orchards averaged as high as \$6 per tree, notably one controlled by Mr. Harry Yerington.

Peaches are now coming in fast. Mr. R. F. Roth sold his Early Crawford and George the Fourth to-day, at three cents.

Grapes ripen early here, consequently early varieties bring good prices. Mr. C. O. Barker sold his crop of Tronseau at \$100 per ton. White Berger and other varieties are now in season. Mr. Barker will shortly put the pickers to work in the company's 100-acre vineyard, which consists chiefly of Muscatel and Zinfandel. The C. H. Ingelow, the Gillig and other vineyards hang heavy with fine fruit.

The fig crop has been good. Mr. J. M. Gilman is now putting away his second crop.

Mr. Gilman has a fine young orange grove, in which many trees are well laden. Banning is yet too new a settlement to boast of many bearing orange orchards, but the few now producing, and the many planted, give promise of future success in that department.

Prunes are a decided success here.

Our beemen are in good spirits; their crops are fair, and owing to failure elsewhere, honey is in demand, and prices advancing. So far only 12 to 15 tons have been sold.

The grain harvest was also good, much better than was expected. Threshing began the 4th of July, and will continue for months to come. Immediately adjoining Banning are over 12 square miles of grain, all cut and stacked, awaiting the thrashing crews.

On the 17th of this month, a grand excursion to Banning will take place. At that time the company will put up one, five and ten-acre lots at auction, without reserve. This has proved a very prosperous season, and we feel that Banning has already entered the "Boom Belt."

JNO. C. KING.

Banning, Aug. 3d.

WHAT ARE THEY THINKING OF?—We can't understand, says the *Cloverdale Reville*, how campers and hunters can leave fires burning in their camp, and continue on their journey without any feeling of safety for the neighborhood and the endangering of life. Just consider that when a fire is started on any of the ranges there is seemingly no limit to the extent of territory it sweeps over. Fences, cordwood and fine timber and a large extent of grazing is generally made desolate. Consider the suffering of the stock that have been deprived of their feed, and the great losses sustained by the rancher. We should think that no reasonable sane man could ever rest a moment until he was sure not a spark remained of the camp fire.

BLACK MULBERRY.—The *Auburn Republican* thinks that the black mulberry would be one of the best kinds of tree to plant along roads and highways in such a region as Placer county. It makes a dense shade and is a much handsomer tree than the locust. Its fruit is good for home use and would serve to keep birds from the orchards. Its wood is said to be as valuable as redwood for fenceposts. C. A. Tuttle says that on his father's farm in Western New York, mulberry fenceposts were good and sound after being in the ground more than 25 years, and V. V. Mann recalls that in Missouri, when every man was his own cooper, mulberry wood was considered the best that could be had for cooperage.

ANTHRACITE coal has been found near Cochees lake, in Washington Territory.

THE FIELD.

An Effort to Secure Agricultural Statistics.

John J. Tobin, Esq., Labor Commissioner for the State of California, is making a vigorous effort to secure facts about the various industries of California, and we trust he will succeed. We have received the following communication in reference to the work:

EDITORS PRESS:—The necessity and usefulness of Bureaus for the collection of statistics relating to labor industries have become so widely recognized that they have been established, so far, in 18 States of the Union. In several of these States, paid agents are employed to gather the required statistics; the remainder, including California, must depend upon volunteer information, as the Legislatures made no provision for such agents. The attempt to collect statistics by mail has heretofore proved a failure; yet this is the means upon which this Bureau must rely. For various reasons, people have failed to respond to the inquiries sent out by Commissioners. Employers have refused to answer because they believed the Labor Bureau was created for the purpose of arbitrarily prying into the conduct of their business in the interest of discontented workmen. Employees feared to answer through an apprehension that it would displease their employers, and thus hurt themselves. Farmers declined to respond through a suspicion that it was a covert scheme to obtain a valuation of their lands and revenue with a view to increase taxation. Some refused because they thought they could not be compelled to answer, and many because they could not understand what benefit could be derived from furnishing the required facts.

Precisely the same difficulty was encountered when census taking was first entered upon. The masses require to be enlightened as to the intent of the law in creating labor bureaus for the purpose of gathering industrial statistics. They must be assured that they are for the interest of labor and capital alike. It should be distinctly impressed upon them that the names of persons filling out blanks, or those who furnish the Bureau with information, will not be made public, but, on the contrary, will be treated with the utmost confidence. In consequence of a knowledge of such facts, there is but little difficulty in obtaining full and accurate information from citizens in Eastern States where labor bureaus have been established for several years. Therefore I appeal to the editorial fraternity of the entire press of the State to aid the Bureau in correcting false impressions and encouraging ready compliance with fair requests for statistical information.

The accompanying blanks will convey an idea of the scope and intent of the investigation for the present year. The inquiries regarding the agricultural, mining, horticultural and viticultural industries will be found outside of and supplemental to the information of technical character supplied to the respective State Boards in charge of these departments.

JOHN J. TOBIN, Commissioner.

Forms for Answers.

In order to show the line the inquiry is taking in the direction of agriculture, we print below several blanks relating thereto. Mr. Tobin will be pleased to receive applications for blanks from any of our readers who will give him the information he desires. His address is 220 Sutter street, S. F. All answers will be regarded strictly confidential. No names will be mentioned in reports and the blanks will be destroyed after being used.

Farm Labor.

FARMS:
Number owning more than 10,000?
Number owning more than 5000?
Number owning more than 1000?
Number owning more than 500?
Number owning more than 100?
Number owning less than 100?
How many of the foregoing are mortgaged?
What rate of interest is paid on mortgages?
How many farms are rented (Chinese excluded)?
Number of acres in such farms; from ... acres to ... acres?
Average rent per acre?
How many farms are worked in shares between owner and renter?
What are the terms?

LABORERS:
What are the wages paid to road laborers?
How many farm laborers are employed (Chinese excluded)?
How many months in the year employed?
What is the rate of wages monthly, with board?
without?
How many hours work per day?
What kind of food do they get?
What sleeping accommodations are provided?
Are cottages provided for permanent laborers?

CHINESE:
How many Chinese are employed?
What are Chinese paid monthly?
How many acres owned by Chinese?
How many acres rented by Chinese?

GENERAL:
Give your opinion as to the treatment of laborers, etc.

To Viticulturists.

Owner of vineyard?
Nearest town?
County?

VINES:
Number of acres in vines?

Number of acres in wine grapes?
Number of acres in raisin grapes?
Number of acres in table grapes?
Number of acres set out in vines from June 1, 1886, to June 1, 1887?

PRODUCTION:
Have you a winery?
If so, what is its capacity?
Number of gallons of wine produced during the season 1886?
Number of gallons of brandy produced during the season 1886?
Number of pounds of raisins produced in 1886?
Number of pounds of green fruit raised?

VALUATION:
Total assessed valuation of land in vines?
Value of wine produced during season 1886?
Value of brandy produced during season 1886?
Value of raisins produced in 1886?
Value of green fruit produced in 1886?

LABOR:
How many white men did you employ permanently last year?
How many Chinese did you employ permanently last year?
What is the largest number of white men you employed any time last year?
What is the largest number of Chinese you employed any time last year?
How do you house your laborers?
Are cottages provided for permanent laborers?
Have you any difficulty in procuring white skilled labor?
If so, in what branch?

WAGES:
Blanks give forms for stating rates of wages by the day, week and month for different classes of laborers.

To Orchardists.

Name of fruit-grower?
Nearest town?
County?

ACREAGE IN FRUIT:
Total number of acres in fruit?
Number of acres set out in fruit from June 1, 1886, to June 1, 1887?

PRODUCTION:
Estimated quantity of fruit raised in 1886?
Estimated quantity of fruit raised in 1887?
Number of pounds of dried fruit shipped last year?

VALUE:
Total assessed value of land in fruit?
Value of fruit produced in 1886?
Value of fruit produced in 1887?
Value of dried fruit produced last year?

LABOR:
How many white men did you employ permanently last year?
How many Chinese did you employ permanently last year?
What is the largest number of white men you employed any time last year?
What is the largest number of Chinese you employed any time last year?
How do you house your laborers (excluding Chinese)?
Are cottages provided for permanent laborers?
Have you any difficulty in procuring white labor?
If so, in what branch?
Do you employ boys and girls?
If so, how many?

WAGES:
Blanks give forms for stating rates of wages by the day, week and month for different classes of laborers.

In the Midst of Drying.

EDITORS PRESS:—I take time to write you a few lines in the midst of the most pressing business. We are operating a steam heat evaporator in drying fruit. The No. 4 Acme, 120 trays capacity, will contain at once 1½ tons green fruit and in about eight hours we can begin to take out dried fruit. The points of advantage are that it cooks and dries the fruit at the same time, and never burns it; the trays are never changed nor moved until the fruit is done; the bleacher is complete, having automatic doors. We utilize every means of drying fast, as we have an immense quantity to dispose of. We dry the fruit about two-thirds on the machine; then empty it on trays about the size of raisin trays, and set in the sunshine. One day will complete the cure. Batchelor & Wylie, S. F., are agents for this machine.

We are favored here with a good market for all kinds of fruit. First come cherry plums, then early peaches—the very earliest are Briggs' May, Waterloo, Alexander and Lulu. The last named I obtained from J. T. Bogue of Martinez. It originated in New York State and is very early, ripening with the Briggs' May; small pit, like Hale's Early; round, good size; beautiful deep red; sweet, pleasant taste; firm meat, and bears early. The Hale's Early finishes up the June peaches, and reaches into July. Then comes the valuable Early Crawford, with others, reaching to August, which is pre-eminently the peach month. In August we have the California Cling, Orange Cling, Jones' Seedling, Late Crawford and others. For September we have Salway, George Late Cling, and October Free. The fruits mentioned, with pears, plums, prunes, etc., make a continuous busy season from May to October.

I am trying the new process of peeling peaches. Dip the peaches in strong boiling alkali water, as you would dip prunes. Find by experiment the length of time to suit—rub the peach with the hand, and the skin will come off smooth and nice, saving much of the peach and time. Afterward pit and dry. This is an experiment. MONTGOMERY PIKE.

Routiers, Aug. 1, 1887.

FIFTY-SIX GROCERIES have been closed in Oakland on account of high license since June 1st.

Treatment of Farm Hands.

EDITORS PRESS:—I think ranchmen and all others having men in their employ make a great mistake in not treating them more humanely than most of them do, and in not providing more wholesome and comfortable quarters for them. The impression with many employers seems to be that a common laborer is of importance mainly as he possesses more or less the muscle and patience of the mule. Brawn and muscle are at a premium, while brain, experience and judgment are of but little account. In fact, many seem to think a hired man has no use for brains and that he has no business to know anything. A stream never rises higher than its fountain. If you wish to make a man brutish, treat him like a brute. Treat a hired man like a human being; give him clean, comfortable quarters, a clean, comfortable bed, clean, wholesome, well-cooked food, associate with him, take an interest in his welfare, ask questions and observe his methods of working; for no one is so stupid and ignorant but some information may be obtained from him, and he will be far more likely to be faithful and do good service than if treated as a brute.

At the East all farm help are treated with the same social equality as members of the employer's family. All eat at the same table, and sleep in good beds with clean sheets and pillows. Such a thing as a person carrying his own blankets and other bedding with him is not known. It is related of one of the earlier Governors of Massachusetts, Gov. Briggs, I think, that he was in the habit of having all of his hired help sit at the same table with himself and family. Some of his aristocratic neighbors took exception to this and remonstrated with the Governor's wife about the matter. On representing the case to him, he remarked, he had been "thinking about the matter, and had come to the conclusion that as the hired help did all the work they ought to eat at the first table," and so ordered.

Fortunately we have some men among us who set an example worthy of imitation in respect to treatment of hired help. Mr. Hiram Corey of this county is a notable illustration of one who looks carefully to the comfort and interest of his hired help, of whom he keeps from 15 to 25 the year round. They are provided with clean, pleasant, comfortable quarters. Each one has a single bed with spring mattress, clean sheets and pillows, which are changed every week. Every room is furnished with towel, looking-glass, comb and hairbrush. Each laborer is furnished with a pair of slippers, to be worn in the house. The dining-room is a model of neatness and order, and the utmost decorum prevails at mealtime. The food is the same as provided for the family. No laborer is allowed to come to the table without first washing his face and hands and combing and brushing his hair. No one is allowed to spit on any of the floors, spittoons being provided in every room. The result is, every one takes a pride in keeping clean and tidy himself and keeping everything clean and orderly about him. All are faithful, and strive to do their work well and please their employer, and that they are all pleased with him goes without the saying. Would that there were more such considerate employers. J. S. TIBBITS, Santa Rita.

Tulare County Notes.

EDITORS PRESS:—I send you per express a box of Late Crawford peaches. The fruit crop, except plums and prunes, is fine here this season. The larger portion of the crop in this and Fresno county is being bleached and sun-dried. The apricot crop is all cleaned up, and the dried fruit marketed at fair prices, some orchards paying as high as \$350 per acre in dried apricots.

About the finest dried fruit I have seen this season is the new white nectarine. It dries beautifully and dries heavy, and when properly introduced in the Eastern market should command as good prices as peeled peaches. This nectarine is as sure a cropper as the peach in this valley; but it will not stand transportation green.

We could make the finest exhibit from this and Fresno county on stone-fruit, of any part of the State, if the fairs came earlier. As it is, our best fruits are all gone when the Mechanics' and State Fairs come off.

The lime, sulphur and salt remedy, used here for the San Jose scale, has been a complete success, as but little specked fruit shows in the very worst orchard on which that preparation was applied.

Some of the boom in the southern part of the State has reached here and good lands are sought after. I am in hopes people won't go crazy here and run values to such a point that interest cannot be made on the investments from the productions of the soil.

The grape yield bids fair to be heavy, and there will be a marked increase in the raisin pack as well as in the amount of wine manufactured.

The grain crop was beyond expectations; so in all respects our valley is prosperous.

Visalia, Aug. 6th. I. H. THOMAS.

[The peaches sent by Mr. Thomas are very fine, large and fully ripe—as fine Late Crawford as we ever saw.—EDS. PRESS.]

The Wheat Crop of 1887.

Talk as we may truthfully, says the S. F. Journal of Commerce, wheat is still in agriculture the *piece de resistance* of California. Hence more interest is taken in the outcome of our harvest crop than in almost anything else in the State. Add to this that California is one of the leading wheat States of the Union, and the anxiety to test the outcome of her harvest is easily understood. Of course, at this time of the year, or indeed any time till toward the close, the task of setting forth in detail the product of the soil is not at all an easy one. It is very likely to be either above or below the truth. Last year, for instance, estimates almost universally accepted as correct were in error fully 40 per cent; in other words, the product did not exceed in bushels what was generally credited with in cents. The outlook was the best harvest ever had. The result, however, disappointed every one. This year a light harvest is looked for; some placing the surplus at not to exceed half a million tons. The harvest, however, as far as it has gone, gives much better results than was anticipated. From due consideration of all available data on the subject, we present to our readers the following estimate of the product of the wheat harvest of 1887: [Here follows a detailed estimate of the wheat yield by counties which foots up an area of 3,262,500 acres, with an estimated yield in round numbers of 21,000,000 cents—or a little over 1,000,000 tons.] Out of this the estimate is that we shall have 800,000 tons for export—the balance will be held for seed and consumption.

There has been an increase in the product of most of the eastern and northern counties of the Sacramento valley, a decrease in the San Joaquin and Santa Clara valleys and the south. The west side of San Joaquin returns nothing, but the islands in the rivers produce plentifully. It is not improbable that the returns, which only average 11 bushels per acre, may turn out much better when the harvesting is finished—as in the Sacramento valley some acres have yielded 35 bushels, but this is the state of the crop as far as known. It is about 5,000,000 bushels less than the actual yield of 1886, but it will pay farmers much better, as there are better prices.

Many have thought 11 bushels to the acre all over the State, even in a dry year, is much too light. Most people think that 13 bushels is none too large, and confidently affirm that the returns from the thrashers will even bear out that, if it does not make it larger. Thirteen bushels would add six and a quarter million bushels to the above figures and make them slightly larger than those of last year. As a general thing, the result in a year of much rain is less than generally anticipated; in a year of light rain, larger than was supposed.

But whatever the result, 1887 cannot be considered a bad year. The whole crop of the world will be light, not as light as now confidently predicted by those who are at the bull side of the market, but still sufficiently light to insure us good prices.

The Richest Man in the World

Would be poor without health. The dying millionaire consumptive would exchange all he is worth for a new lease of life. He could have had it for a song had he used Dr. Pierce's "Golden Medical Discovery" before the disease had reached its last stages. This wonderful preparation is a positive cure for consumption, if taken in time. For all diseases of the throat and lungs it is unequalled. All druggists.

"A Word to the Wise is Sufficient."

Catarrh is not simply an inconvenience, unpleasant to the sufferer and disgusting to others—it is an advanced outpost of approaching disease of worse type. Do not neglect its warning; it brings deadly evils in its train. Before it is too late, use Dr. Sage's Catarrh Remedy. It reaches the seat of the ailment, and is the only thing that will. You may dose yourself with quack medicines till it is too late—till the streamlet becomes a resistless torrent. It is the matured invention of a scientific physician. "A word to the wise is sufficient."

Delicate diseases of either sex, however induced, promptly, thoroughly and permanently cured. Send 10 cents in stamps for large illustrated treatise, suggesting sure means of cure. Address, World's Dispensary Medical Association, 663 Main Street, Buffalo, N. Y.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

H. A. SPENCER, veterinary surgeon of San Jose, whose advertisement appears elsewhere in this paper, is a graduate of one of the best veterinary colleges in the U. S. Within the past few years, we understand, he has performed some quite remarkable operations with gratifying success—in one instance removing from the intestines of a horse a tumor weighing four and a half pounds, after the case had been given up by S. F. veterinarians. In another case, where both tendons of a foreleg had been severed, a perfect cure was effected. Dr. Spencer has also written considerably upon the diseases of animals.

San Jose Notes.

[Written for the RURAL PRESS by J. C. H.]

The fruit-driers and canneries in and around San Jose are working to their fullest capacity. An abundance of fruit and competition of buyers direct from Eastern cities has made the business an absorbing and leading interest in this locality. There has been and is now a scarcity of hands for picking and handling the fruit. This state of affairs has established a new feature in the labor question. Every morning carry-alls are sent around to gather up the young people and women for picking and gathering fruit. After the day's work is finished the crews are returned to their respective homes. Wages range from 75 cents to \$1 for lads and lassies from 12 to 15 years, and from \$1 to \$2 for adults. There is a scarcity of hands in and around San Jose, and is at present a serious drawback to the gathering of fruit in season.

Ingham's Orchard Cultivator.

Mr. J. Ingham of San Jose has been laboring for several years to build a sulky cultivator to meet a demand of the fruit-growers of the Santa Clara valley. By experiment and field tests in several of the large orchards and vineyards he has received an unqualified indorsement of his cultivator. His latest improvement is a device that avoids all side draft and a protection from barking the trees. There will be one exhibited at the Santa Clara Fair, and an illustration and more minute description will appear in the RURAL soon.

Flickinger's Cannery.

A RURAL representative made a flying visit to J. H. Flickinger's cannery and orchard, situated three miles from San Jose. This orchard, consisting of about 80 acres, was planted in 1880 on land that had been used for several years in raising grain. The vigorous growth and quality of fruit has been pronounced by experts, among whom is A. H. Hatch, one of the best in this State. A force of 150 persons were busy caring for apricots and peaches, divided as follows: 50 picking, 50 attending to drying, 60 canning. The arrangement of this plant for labor-saving and comfort of the operators, as Mr. J. J. Groome, superintendent, expressed it, is almost perfect. The fruit is picked from the trees and brought direct to the receiving-house, and none but perfect fruit is allowed to pass to the operators. A noticeable feature of this cannery is that every portion is kept scrupulously clean and every can or jar is washed, steamed and dried before using. It is a picture peculiar to California life to see a great army of young people clad in clean outer garments busy filling the cans and jars with fruit. This cannery is putting up 20 tons a day now, and a large force was engaged for the coming week that would bring it up to 25 or 30 tons a day. Mr. Flickinger has given the subject of fruit-raising and marketing much thought and careful study. His theory of picking the fruit and canning when fresh, and using heavy syrups, will bring up the standard of California preserved fruits to the highest grade, and make a market for them in all parts of the world. This young orchard and model cannery has gained quite a local celebrity, and there were a number of visitors present who had come from remote portions of the State to examine this new enterprise.

Real Estate.

Messrs. Spencer & Covill, one of the oldest and leading real estate firms of San Jose, have been quite successful in dividing up several large tracts of land in subdivisions, and disposing of the same to bona fide settlers, a number of whom are late arrivals from the East. Santa Clara valley has become the center of large dealings in land lately, and many parties wishing information are applying to Spencer & Covill.

The Orpheum.

[COMMUNICATED.]

Our city has just had added to its places of amusement one, an account of which, from an instructive and scientific standpoint, is well worth the attention of our readers. Electricity has had yearly new purposes to serve, and in the future many additions to our pleasures and comforts will be furnished by this manifold agent of usefulness, the modern illustration of Aladdin's lamp.

By a system of wires, the currents through which are derived from a powerful battery, musical instruments are made to play at the touch of a performer sitting at the key-board. Contact is made between the several wires and the battery by means of a small lever attached to each note. As the current reaches the coil at each instrument, its core, movable and delicately balanced, becomes magnetized, and is, by a mechanical device varying in different instances, made to beat a drum, clash a cymbal, chime the bells, and set in lively motion nightingales, cuckoos, and a black bear with rolling eyes and an electric lantern, both brilliantly alight.

These all supplement the orchestra, which latter is composed entirely of Hungarians, who have come direct to this coast from Buda Pesth, Europe, under the direction of Herr Rosner, the courteous and talented inventor of the "electric orchestra." Their playing is excellent, having a completeness of finish, purity of tone and perfectness of unison only to be found in the performances of skilled musicians who have long practiced together.

Our country visitors have a rare treat in store for them, and a night or two spent at the Orpheum will serve to amuse them when in town and their neighbors when they return home. The intention of Herr Rosner is, we understand, to be an immediate return to Europe at the end of three months, for which term his services and those of his entire orchestra have been engaged by the enterprising proprietors of the Orpheum, Messrs. Walter & Roberts, than whom none have been more successful in catering for a rather critical public. Nothing of this kind has ever been produced in America, and we doubt if San Francisco will not lead the Eastern States in wealth, work and play before many years.

The electric storm deserves special notice. The imitation of lightning is produced by a supply of electricity from the electric light works, the connections only being made from the key-board. The machines (these are also suspended in the center of the room) for producing an imitation of wind, hail, rain, the two well-toned organs (a third and larger one is in course of erection), all tend, when supplemented by characteristic music from the orchestra, to give a sense of realism to which no description of ours could do justice.

The management does not, however, rely solely on this class of music. A better variety show has never been witnessed by us. Mlle. Garetta, with her performing pigeons, thoroughly trained and of rare beauty and species, gives as pretty and interesting a performance as young or old could wish to see, and is an excellent addition to a repertoire comprising, among others, Millis, the ventriloquist, who sings a quartet and decapitates one of his "suite." Messrs. Fields and Hanson, a "nigger host" in themselves; Whitfield, the man of a hundred faces, from George Washington to the latest Paddy "at liberty;" Ouda, a youth of 16, who without doubt can give a wrinkle or two to the San Francisco gymnasts—all go to make a performance which those interested in "doing things well on the coast" must pronounce a complete success.

Messrs. Kellett & McMurray have finished the interior with great taste; harmony reigns supreme, one's eyes and ears being equally well pleased. The instruments are suspended in all parts of the house, and on entering, the novelty of such appearance at once arrests attention.

BENEFICIAL RESULTS OF SUMMER-FALLOWING.—We have for free distribution 100 copies of a concise and valuable treatise on this subject by the eminent agriculturist, Henry Stewart. Apply to Bull & Grant Farm Implement Co., 14 Main street, S. F.

IMPROVED CHAMPION Cider Mills and Presses.

Three Sizes—Senior, \$40; Medium, \$30; Junior, \$25.

Best Cider Mill in the World.

Easiest Worked.

Strongest and Will Last Longer than any other Mill.

The strainer board under the tubs allows a free passage for the cider from the tubs without obstruction of any kind. Our Mills are light, substantial, and handsomely finished.

The very extensive sale we have had for our Mills proves their popularity in all sections of the country, and we will guarantee them to grind as many apples in a given time and produce as much cider from a given quantity of apples as any other hand-power mill in America, and do it with much less labor than any other mill on the market.

TRUMAN, ISHAM & HOOKER,
 SAN FRANCISCO, CAL.

ZIMMERMAN

Fruit Evaporator.

Read Some of the Testimonials.

I have found the Machine (No. 3) very simple, and it does the work to perfection. Parties who have larger Driers of different makes say they cannot turn out superior fruit (apricots and peaches) to mine.

Vacaville, June 12, 1887.

I. W. A. GILMORE.

I found the Machine (No. 2) good, and can truly subscribe to all the merits claimed for it. I have sent apples to Santa Rosa and they sold as first-class.

Laguna, July 15, 1887.

W. H. J. AITKEN.

Evaporator came safe to hand (No. 3). Have tried apricots with good success.

Stockton Nursery, July 15, 1887.

E. C. LEWES.

Before writing I wanted to test the Drier also on peaches, apples and pears. Am now doing so with the very best results. Upon the whole, I am greatly pleased with the Drier.

Batavia, July 20, 1887.

(Rev. Dr.) W. ALEXANDER.

I am doing fine work with the Drier (No. 3). Have tried it in company with Mr. A. J. Lay, and he, after buying it, takes it all. You can refer to me and I will try to sell more.

Glenwood, August 5, 1887.

C. C. MARTIN.

I have been using a Zimmerman (No. 3) Evaporator on my apricots this season, and cheerfully attest the fact that its performance is fully up to its promise. Its simplicity is such that, although novices, we have succeeded in turning out admirable work, and its economy and facility are quite remarkable.

August 9, 1887.

TWENTY-SECOND INDUSTRIAL EXHIBITION

AND MECHANICS' FAIR.

SAN FRANCISCO, 1887.

Opens September 1st, closes October 8th

The Trustees of the Mechanics' Institute take pleasure in announcing that the coming Exposition promises to be the most attractive and important to the producers of this State of any yet given.

Several Counties have already applied for space to make a general exhibit of their resources, and it is now an assured fact that the whole of the immense pavilion, with its annexes, will be filled with California's choicest productions, both natural and manufactured.

An Orchestra of 50 celebrated soloists and musicians, under the leadership of the celebrated Trombone Virtuoso, Fred N. Innes, has been engaged, and will perform each afternoon and evening.

The immense Art Galleries will be filled with choice works of Painting and Sculpture; the Machinery Hall and the Agricultural Machinery and Implement Department will contain the best and latest inventions in mechanic art.

Intending Exhibitors should lose no time in applying for Space.

Liberal Premiums in Each Class will be Awarded.

No Charge for Space, Steam or Power.

PRICES OF ADMISSION—Double Season Ticket, \$5; Single Season Ticket, \$3; Adult's Single Admission, 50 Cents; Children's Single Admission, 25 Cents.

Season tickets to members of the Institute at half price.

Full information given or sent on application to the office, 31 Post Street.

A. W. STARBIRD,

Secretary.

P. B. CORNWALL,

President.

HORTON & KENNEDY'S

FAMOUS

ENTERPRISE

Self-Regulating

WINDMILL

Is recognized as

THE BEST.

Always gives satisfaction. SIMPLE STRONG and DURABLE in all parts. Solid Wrought-iron Crank Shaft with DOUBLE BEARINGS for the Crank to work in, all turned and run in adjustable babbitted boxes.

Positively Self-Regulating.

With no cone springs, or springs of any kind. No little rods, joints, levers, or anything of the kind to get out of order, as such things do. Mills in use 6 to 12 years in good order now, that have never cost one cent for repairs. All genuine Enterprise Mills for the Pacific Coast trade come only through this agency, and none, whether of the old or latest pattern, are genuine except those bearing the "Enterprise Co." stamp. Look out for this, as inferior mills are being offered with testimonials applied to them which were given for ours. Prices to suit the times. Full particulars free. Best Pumps, Feed Mills, etc., kept in stock. Address,

HORTON & KENNEDY.

Martinez, Cal.

ALWAYS AHEAD!

\$35. Golden State \$35.
WINDMILL.

\$35.00 CASH.

Has stood the severest tests of practical use for many years. It is STRONG, DURABLE, SELF-REGULATING, STORM-DEFYING. Requires less wind than any other Mill, and embraces all the latest improvements. It has the shortest shaft and is the best balanced Mill ever made. The frame, or rims, of the wheel are bent, material used in their construction being the best. There is no simpler or more perfect self-regulator made.

Runs in the Lightest Wind.
Defies the Fiercest Storm.
Never Blows Down.
Always in Order and Ready for Use.
Any Farmer Can Repair it.
You Will be Delighted.
It is low in Price—only \$35 Cash.
You buy your Mill from the manufacturer.

Should a farmer be without a Windmill when he is able to procure one of our Golden State Mills for \$35 cash? You will save the cost of Mill in six months. Call and see our mill that costs but \$35 cash, or send for circular.

Send for our Special No. 14 Catalogue. We carry the most complete line of

Windmill Force Pumps and Pumps for Every Purpose, Tanks,
Pipe, Pipe Fittings, Brass Goods.

WIND MILL

MERY'S IMPROVED PIONEER

BARLEY CRUSHER

Using the Benoit Corrugated Rollers.

STILL AT THE FRONT.

This Mill has been in use on this Coast for 6 years,
TAKEN THE PREMIUM AT THE STATE FAIR

Four years in succession, and has met with general favor,
there now being

Over 200 of them in use in California, Nevada & Oregon
It is the most economical and durable Feed Mill in use. I am sole manufacturer of the Corrugated Roller Mill. The Mills are all ready to mount on wagons.

TRAVER, May 3, 1887.

Having used one of the Barley Crushers manufactured by M. L. Mery, of Chico, Butte county, I can say it will do all that is claimed for it, and to those wishing an A No. 1 machine, I would recommend it as the very best I have crushed 35 tons in 11 hours' work.

J. D. GOLDEN.

M. L. MERY, Manufacturer, Chico, Cal.

I thank the public for the kind patronage received thus far, and hope for a continuance of the same.

M. L. MERY,

CHICO IRON WORKS,

CHICO, CAL., Feb. 1, 1887.

M. L. Mery, Esq.—DEAR SIR: The 9x14 Barley Crusher bought of you and used in the California Mills, gave entire satisfaction; have crushed 8000 pounds an hour. I have also crushed as much or more on set 10x20 when working for General Bidwell, which set he is using in his mill to-day. Yours truly,

GEO. SHAND.

FIRE-ARMS of all sorts, hunting and gymnastic goods in great variety, can be found at the establishment of George W. Shreve, 525 Kearny St., S. F., advertised in another column. He also does fine gun-work. Those who find it inconvenient to call there in person, but have occasion for anything in his line, can obtain an illustrated catalogue of 80 pages, by sending him a stamp with their address.

BAR NONE!

Certain Windmill men, whose mills are made of ---well, call it Leather---make the claim that their mill will run in lighter breeze than any other. In point of fact it was this very "Leather" mill which, side by side with the CYCLONE, would only do half as much work.

OAKLAWN FARM,

The Greatest Importing and Breeding Establishment in the World! Its Importations of Percherons have Exceeded the Combined Importations from France of any other Eight Establishments of the kind in America.

OAKLAWN MAINTAINS ITS PRE-EMINENCE

IN CHOICEST SELECTIONS OF

PERCHERON HORSES!

—AND HAS—

Demonstrated the Value of Experience

(WHICH CANNOT BE BOUGHT) BY THE

Superior Quality of the Stock in its Annual Importations for 1887, Numbering about 300 Head,

And including the First-prize Winners of the last and Greatest of all the Horse Shows of France the present year, held at Mortagne, by the Societe Hippique Percheronne. At this show were exhibited about 400 pure-bred Percherons, being three times as many as were shown at any other Fair of France, this year.

All the First-Prize Stallions but One and Eleven Other Prize-Winners

Of this show were part of the stock previously selected in person and purchased by M. W. DUNHAM, for importation to Oaklawn Farm, Wayne, Ill.

FRENCH COACH HORSES---50 STALLIONS AND MARES,

Selected from the best breeding establishments of the country, several of which have never heretofore sold to a private individual until the French Government had made its selection and purchase from the stable. This lot comprises nearly all the prize stallions of the Government Show of 1887, and three of the five stallions entered for the French Derby Trotting Stakes—value 125,000 francs. The Coach stallions combine size, action, beauty and endurance; weight, 1200 to 1500 pounds. These horses are the get of stallions owned by the French Government, and are all large (16 hands or over) good actors with fine symmetry; in fact, the best lot ever seen together. The mares are of the choicest individual excellence, and bred to Government stallions.

TWO IMPORTATIONS ON THE WAY.

ANOTHER TO ARRIVE BY SEPT. 1st.

Permanent Success in Breeding Assured Only by Selection of the Best.

Visitors welcome. Carriages at all trains. Send for 120-page catalogue, illustrated by ROSA BONHEUR. Address

M. W. DUNHAM, Wayne, Du Page Co., Illinois.

Dated, July 28, 1887.

A. T. DEWEY. } Dewey & Co.'s Scientific Press Patent Agency { ESTABLISHED
W. B. EWER. } 1860
GEO. H. STRONG. }

INVENTORS on the Pacific Coast will find it greatly to their advantage to consult this old, experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us often to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St., S. F.

GOPHER TRAP.

BERTIE JOLLY'S NEW TRAP, NOW OFFERED FOR SALE, is warranted to be the Simplest, Cheapest and Most Effective Trap in existence. Sent by mail, post-paid, 25 cents each; \$2 50 per dozen. Address

RICHARDSON.

Among a host of competitors, many of which are excellent Instruction Books,

Richardson's New Method for the
Pianoforte

Still serenely occupies the position of the "winning yacht" in the race for popularity.
Its sale has been tremendous. Edition follows edition in rapid succession, and it will not be long before it will be safe to announce

A HALF MILLION COPIES

As the total number printed and sold.

"RICHARDSON" is a very correct book. For a long time, no error in a phrase or note has been recorded.

"RICHARDSON" has become a standard favorite with a multitude of teachers, who find an advantage in giving lessons from a book with which they are familiar, and that by its high reputation secures the respect and interest of the scholar.

"RICHARDSON" has advantages in the way of good illustrations of the position and action of the fingers, and also in the few pages of advice to players from the pens of Schumann and Czerny.

Mailed for the price, \$3.00.

OLIVER DITSON & CO., Boston.

C. H. DITSON & CO., 387 Broadway, New York.

COMMON SENSE

Steam Fruit Evaporator.

BACHELDER & COATES,

Manufacturers and Sole Owners for California.

A very superior, unbleached Dried Fruit produced at less than half the expense and in less than half the time claimed by any other drier.

APPLICABLE EITHER TO THE SMALLEST FAMILY OR THE LARGEST FRUIT GROWER.

Full particulars and samples of fruit on receipt of two-cent stamp.

These Driers are now in successful operation, and results prove our claims.

BACHELDER & COATES,
Napa City, Cal.

ORANGE TREES! ORANGE TREES!

Also LEMON and LIME, in large or small lots, both wholesale and retail, CHEAPER THAN EVER BEFORE OFFERED IN THIS MARKET, of the best known varieties.
Our Washington Navel was budded to order, with buds from original trees at Riverside. All other varieties selected by personal inspection; possess the highest excellence and great bearing qualities. They are all budded on the famous sour stock, which is hardier, more vigorous, longer lived and superior in every respect to the sweet stock.
We are prepared to take contracts to plant groves of these trees, and guarantee them to grow. We can also furnish Seedlings in any desired quantity, either Sweet or Sour, AT VERY LOW RATES.
Place your orders soon, to secure choice trees at the lowest rates. Send for descriptive circular and price list.

315 and 317 Washington St., San Francisco, Cal.
Address, P. O. Box 1901.

ORANGE, LEMON & LIME TREES
FOR THE SEASON OF 1888.

Having the exclusive Agency of the Pacific Coast for the extensive Nurseries of A. Wimberly and A. J. Bach & Son, of Palatka, Florida, we are prepared to furnish Orange, Lemon and Lime Trees of all the leading varieties (budded on seedling stocks) in any quantity desired, from one tree to ten thousand,

AT PRICES THAT ALL CAN AFFORD TO PLANT.

These Trees are all first-class, 3 feet and upward in height and three-fourths of an inch and over in diameter at base of bud.

It will be necessary to give your order early to secure prompt delivery. Special prices given for carload lots. Write for prices or any information desired. Address

C. W. REED & CO.,

SACRAMENTO, CAL.

Farmers and Viticulturists, Attention!

FERTILIZE! FERTILIZE!

NITROGENOUS SUPERPHOSPHATE.

UNIVERSITY OF CALIFORNIA, Nov. 3, 1886.

Dr. J. KORNIG—Dear Sir: I have analyzed your sample of "Nitrogenous Superphosphate," with the following result:

Soluble Phosphoric Acid.....	12.90 per cent
Reverted Phosphoric Acid.....	.95 "
Insoluble Phosphoric Acid.....	2.83 "
Potash.....	2.23 "
Ammonia.....	1.87 "
Nitric Acid.....	2.95 "

The above amount of Nitric Acid is equal to 0.85 per cent Ammonia, therefore, total of Nitrogen calculated as Ammonia, 2.72 per cent.

This Fertilizer is a valuable manure for vineyards, orchards, gardens, farms, and I recommend its use by the cultivators of the soil generally, in California. Yours truly,

DR. E. A. SCHNEIDER.

University of California, College of Agriculture.

BERKELEY, Nov. 20, 1886.

Dr. J. KORNIG, San Francisco—Dear Sir: I take pleasure in adding my testimony to that of Dr. Schneider as to the high quality of the "Nitrogenous Superphosphate" Fertilizer, analyzed by him at your request. It is a high-grade article, and as such returns the user a better money value than a low-grade

H. M. NEWHALL & CO., Agents, 309 and 311 Sansome St., San Francisco.

fertilizer. It is especially well adapted to use in California, on account of the predominance in it of Phosphoric Acid, which is generally in small supply in our soils. Yet it is desirable that "complete" fertilizers be used in our orchards and vineyards, and yours is of that character in furnishing Potash and Nitrogen as well. Very respectfully,

E. W. HILGARD.

The value of this Fertilizer consists in the large percentage it contains of Phosphoric Acid—the chief element of all plant food—in combination with the necessary quantities of Potash and Ammonia, and the ease and cheapness with which it can be applied.

In ordinary soils the following quantities will be found sufficient: For Wheat, Barley, Corn and Oats, 300 to 350 pounds per acre. For Grass, Sugar Beets and Vegetables, 250 to 300 pounds per acre. For Vines, Fruit Trees, from 1/2 pound to 1 pound each. For Flower Gardens, Lawns, House Plants, etc., a light top dressing, applied at any time, will be found very beneficial.

FOR SALE IN LOTS TO SUIT,

On board cars at Sbranto, Station of the C. P. R. R., 20 miles north of San Francisco, at \$30 per ton, by the MEXICAN PHOSPHATE & SULPHUR CO., H. DUTARD, President, room 7, Safe Deposit Building, or

HEADQUARTERS FOR ALL KINDS OF BALING PRESSES —AND— HAYING TOOLS. THE MONARCH, JR., HAY PRESS.

IMPROVED FOR 1887.
Any young man can earn more on an investment of \$500 in this press than can be earned in expending \$2000 for any other machine. We have a Monarch Press, which we sell for \$800, but has been used a very little and is just as good as new, which we will sell for \$450.

THE CLIMAX HAY PRESS, \$300.

Weight, 2200 lbs. A crew of three men—four can be used to advantage. Five ropes are used on the bales. Capacity, 10 to 15 tons per day. The best press for the money in the world.

The Celebrated Petaluma Baling Press.

Weight, 2600 lbs. Price, \$350, delivered at the factory. Size of bale, 22x22x48 inches. Capacity, 26 tons per day. Weight of bale from 225 to 400 lbs. This remarkable machine still stands at the head of all vertical baling presses, and probably bales three-quarters of all the hay west of the Rocky Mountains.

Whitman's IMPROVED New Rebound Plunger.

GREATLY IMPROVED FOR 1887.

Do not confound our New Press with that made two years since. EVERY PRESS FULLY WARRANTED. For one or two horses. The most powerful in use. The most rapid and durable, and the most perfect. Makes the most perfect bale. The most simple to operate. Least expense for repairs. NO STOPS FOR TYING BALE.

The Greatest Success of the Age.

Victorious in every contest. Double-acting, with new concentrating power. Do not buy a Press until you have seen the Improved New Whitman with concentrating power. Puts from 10 to 15 Tons in a Car.

16x18 Mounted, weight, 3600 lbs. \$400 00
16x22 Mounted, weight, 3300 lbs. 450 00
All make bales of variable size.

Hay Forks, Hay Carriers, Harpoon Forks, and all kinds of Haying Tools in great variety. In baling your hay, use our Steel Baling Ties. Cheaper than Wire—Better than Rope.

TRUMAN, ISHAM & HOOKER,

As other makers IMITATE our Giant Powder, so do they Judson, by Manufacturing a second-grade, inferior to Judson. BANDMANN, NIELSEN & CO, General Agents, San Francisco.

THE GOLDEN GATE PLUG CLOSET.

WITH TRAP.

This Closet is the Best, Because

1. It has a simple, strong valve, suitable for any pressure, self-closing by a genuine Phosphor Bronze Spring, acting with the pressure. To prevent breaking and weakening of the spring, I have gone to the expense of using Phosphor Bronze Wire, which will have the desired effect.

2. It has a real sanitary overflow, a copper float attached to a bell of the same metal resting on face of the brass overflow pipe, operated by the rising of the water in the closets above its level, thus absolutely preventing any escape of sewer gas, even the closets being without water.

3. It has no dead corner, consequently no foul water will be left in the closet after lifting of the handle. A constant rush out of the flood chambers will keep the closet and trap perfectly clean.

With above stated points, I am able to call my Closets the most perfect and cheapest in the market. N. B.—Architects who endeavor to furnish their patrons with the most reliable goods, should not hesitate to give this closet a trial. Send for descriptive catalogue.

JOSEPH BUDDE, Manufacturer, 43 Fremont St., San Francisco.

HOP PRESSES.

Send to us for circular, cuts, and prices of new hand-power Hop Press possessing the following advantages:

1. Perfect facilities for putting on the cloth, as the bale, after being pressed, is fully exposed at the sides and ends.
2. A good depth of box for a hand press (7 feet).
3. A perfectly tight and solid box with no slots or sliding pieces at the ends.
4. A press that presses downward so that bales come out at the bottom.
5. Powerful progressive leverage and the entire absence of cast iron racks (which are always liable to break and fail to give the required power at the pinch).
6. A balanced follower that goes up without assistance.
7. A press which lets the follower swing entirely out of the way when up so as to allow of easy feeding, and which has no overhead beams in the way.
8. Perfect facilities for feeding, the top of the press being even with the floor, so that the hops can be pushed or slid into it.

ENGINES AND BOILERS A SPECIALTY.

Worth's Patent Combined Screw and Toggle Lever Wine and Cider Press.

First Premium awarded on Wine Press at Sonoma and Marin Agricultural Fair, Sonoma Agricultural Park Association, Santa Clara Valley Agricultural Society and Mechanics' Institute, S. F.

I desire to call the attention of wine and cider makers to my Improved Press. The follower has a movement of 26 1/2 inches, the first revolution of the screw moves the follower 1 1/2 ins., the last revolution is but 1-16 of an inch, thereby the power increases in the same ratio as the resistance. The platform is 50 inches wide and 10 feet long; is run back and forth under the press on a railroad track.

Has two baskets, by which you can fill the second basket while the first one is under the press, thereby doing double the amount of work that can be done on any screw or lever press in the market that use only one basket, for this reason: While my press is working continuously the other kinds are doing nothing during the time they are emptying and filling their basket.

Printed Testimonials can be had on application of the following parties, who have bought my press: J. B. J. Portal, San Jose; Wm. Pfeiffer, Guberville; Joseph Walker, Windsor; Kate F. Warfield, Glen Ellen; Joseph Drummond, Glen Ellen; Isaac De Turk, Santa Rosa; John Hinkelman, Fulton; J. & F. Muller, Windsor; R. C. CIDER MILLS.

LATEST IMPROVED BUCKEYE CIDER MILL.

These Mills are constructed upon a principle entirely different from other portable mills now in the market. It is embraced in a single frame 2½x3 feet, has a two-inch wrought-iron screw, is neatly and substantially made, is conveniently moved from place to place, is easily worked by hand. Two men can grind and press from six to ten barrels per day. This mill crushes apples instead of grinding, as most others do. It has three cast-iron cylinders with straight fluted ribs, the first or upper cylinder crushing the apples into a coarse pomace and then feeding it through the lower cylinders, which crush it into a fine pomace, it being impossible for any to pass through without being thoroughly crushed. You may finely grate or cut an apple, but unless particles are bruised or mashed you cannot press out the cider.

PRICE LIST.

Buckeye, No. 1, 358 lbs. \$50 00
Buckeye, No. 2, 151 lbs. 30 00

HUTCHINSON'S FAMILY CIDER PRESS.

Hutchinson's Family Cider Press will grind from six to eight bushels of apples, and from ten to twelve bushels of grapes, currants, etc., per hour. One man can make with it from two to three barrels of cider, or from 100 to 150 gallons of wine per day.

It is the neatest, simplest, can be easily handled by one man, and is just the thing for grocers and fruit dealers.

This mill weighs 150 pounds.

PRICE LIST.

No. 0, 102 lbs. \$20 00
No. 1, 146 lbs. 25 00

CIDER PRESS SCREWS.

We are manufacturing a superior wrought-iron Screw, of which this cut is a representation. These screws are made of the very best quality of iron, with fine threads, and nuts cut through solid metal, which render them very powerful and durable, and are warranted to have as much, if not more, strength than any other like screw of the same dimensions.

TWENTY-PAGE EDITION.

Vol. XXXIV.—No. 8.

SAN FRANCISCO, SATURDAY, AUGUST 20, 1887.

\$3 a Year, in Advance
SINGLE COPIES, 10 CTS.

Sonoma County.

Next week the program of the fairs will call the throng of visitors to Santa Rosa, where the county fair of Sonoma county will be in progress. There is reason to expect unusually good things from Sonoma county this year in spite of the signal triumphs of the past. The seed sown by a few enterprising residents of the county by their displays of county products under the auspices of Pomona Grange has grown and borne good fruit in the new life and enterprise which has come to the development of the county. It will be remembered that the first gathering of products, after full local display, was sent East and abroad, and its influence in calling the world's attention to the county has never ceased. Fortunately, too, these energetic pioneers in the work of county exhibits have continued their work and their later achievements have far surpassed their early efforts, and thus the enterprising work has grown year by year, displaying new excellence and extending to an ever-widening circle of influence. This year's work will, we expect, attain a still higher standard. As the value of such efforts in attracting attention of enterprising, capable, and energetic people to investment within the borders of the county, more people are drawn to the support of such efforts and those who labored nearly alone in gathering the first display find many to aid them now. All the more honor pertains to the path-finders in this enterprise. Sonoma has always appeared to us one of the grandest counties in California. Its area of good land is large; its diversity, from the enduring pastures of the coast to the warmth of sheltered hillsides, the rich broad valleys and the deep alluvium of its river-bottoms, welcomes almost every agricultural industry to successful enlistment within its borders; its products and resources, aside from the outcome from cultivated fields, its great forest enterprises, and its dairy products and its wool from mountain pastures—all these, and more, make Sonoma almost a kingdom in itself. All it has needed for years has been an infusion of spirit and enterprise to develop its resources, and these during the last few years have rallied to its support in a most satisfactory manner.

Judging from recent reports, the past year has been one of great accomplishment in Sonoma. The growth of the chief towns has been very satisfactory, and it is growth of the right kind, steady appreciation and improvement, which pave the way for enduring prosperity. Santa Rosa, the county seat, where next

week's fair will be held, has long been famous for its natural beauty, in part due to its delightful climate, but of late there has been in progress measures of internal improvement, the betterment of streets and means of conveyance, lighting, dust-laying, etc., which have been a most excellent setting for the architectural gems in business and residence structures, which have risen since newer life has come to the town. One who goes to Santa Rosa next week will see sights which will delight and encourage and create most favorable impressions

ally charmed and held fast by personal investigation. All those who do not care to yield allegiance to her charms should keep their eyes from the sight of them. Those who are ready and willing to be won by delightful natural conditions and by cordial people should visit the county, and a good place and time for beginning will be at the Santa Rosa Fair during the coming week.

POOR FLORIDA.—We are disposed to sympathize with our sister beside the Gulf in her

A California Almond.

Almond-growing seems to be coming upon a much more satisfactory basis in this State than it held a few years ago. It was for some time a question why the thousands of trees which were finally cut out, or worked over into other fruits, chiefly prunes, were unproductive. First, the general verdict seemed to be that the matter of situation or exposure was a prime factor in success with almonds. Later it has come to be considered very largely a question of proper varieties. Whether both

these considerations pertain, and which is the more important, cannot, perhaps, be definitely settled yet, but enough has been learned to warrant almond-planting in many parts of the State, providing a trustworthy bearing variety is secured. Fortunately we have a large number of well-tested seedlings in the State, notably those of Mr. Hatch, which have been frequently alluded to in the RURAL.

We give on this page an engraving of the "Commercial" almond, which originated in Tulare county and has been propagated for a number of years, in a small way, in different parts of the State.

The tree possesses marked and very distinctive characteristics. It is of a peculiarly sturdy growth, the wood being much larger than that of other varieties of

A CALIFORNIA SEEDLING ALMOND—THE COMMERCIAL.

of California spirit and progress. One thing which pertains to recent development in Sonoma county is improved means of transportation and travel, linking more closely the valleys and bringing the whole county into more direct communication with overland highways. This need was urged by enterprising citizens of Santa Rosa valley, and their efforts have resulted in road-building now in progress which will give Sonoma county advantages of egress and ingress which she has not enjoyed hitherto. The line of the Sonoma Valley is being extended through the upper end of the valley to Santa Rosa, and a branch from Santa Rosa to the main line of the Southern Pacific system is also being pushed through. Still her splendid water transportation remains, and with her new rail routes Sonoma will be better circumstanced than many of our counties in the access for her products to various markets.

Just now real estate movements in Sonoma county, and especially adjacent to Santa Rosa, are especially active. The county is being popularized by the energy of real estate men, and the attention of thousands, who might otherwise be left ignorant of the advantages of the county, is being attracted. One excellent thing about Sonoma is, that visitors are gener-

ally charmed and held fast by personal investigation. All those who do not care to yield allegiance to her charms should keep their eyes from the sight of them. Those who are ready and willing to be won by delightful natural conditions and by cordial people should visit the county, and a good place and time for beginning will be at the Santa Rosa Fair during the coming week.

POOR FLORIDA.—We are disposed to sympathize with our sister beside the Gulf in her

many bereavements and afflictions. Her cup was not full, it seems, when she lost her winter-boarder business, and the hosts came to plant the boom idea in Southern California, where it flourishes far more vigorously and substantially than it ever did in Florida. But it was not enough to be left deserted and alone off in her corner on the way to nowhere. Even greater humiliation is to be heaped upon her. It is telegraphed from New York that a sort of an agricultural spy, sent out by the Italian Government to see what American enterprise is doing and can do in the production of Mediterranean fruits, reports that "Florida soil is not fit for the growth of oranges," anyway. This is the unkindest cut of all, except the slur which the New York Sun tacks on to the Italian's statement, that "among all the individuals whom we know to have invested money in Florida orange groves, we cannot recall one who grew rich." Again we are disposed to exclaim: Poor Florida. Pine on your barrens. Lock your doors and sink your keys in the Gulf.

ADMISSION DAY.—Gov. Bartlett has issued a proclamation appointing Friday, Sept. 9, 1887—the anniversary of the admission of the State of California into the Union—a legal holiday.

almond. It retains some of its leaves all the winter, and therefore has been called almost an evergreen. It is very prolific, the out showing its ordinary way of bearing, but only about six-sevenths the natural size of the nuts.

The almond is assuming so much importance in the State at the present time, especially, as noted above, those varieties of California origin which are found to far supersede the European sorts, that a promising almond like the "Commercial" is of peculiar interest. Mr. Leonard Coates of Napa, who is propagating it, thinks it is the largest almond known, and as such it must be of great commercial value. It is thin-shelled and the kernel sweet and delicate in flavor.

PLUMS AND PRUNES.—This will be the subject for discussion at the next meeting of the State Horticultural Society, which will be held at the new rooms of the State Board of Horticulture at 220 Sutter street, on Friday afternoon, Aug. 26th. Messrs. S. F. Leib and J. H. Flickinger of San Jose were invited to be present and take part in the discussion. All interested in fruit-growing are invited to be present.

THE Union Iron Works of this city have secured the Government contract for building another of the five new cruisers.

FLORICULTURE.

In a Ventura Garden.

EDITORS PRESS:—Among the floriculturists of California we find Mrs. Theodosia B. Shepherd of San Buenaventura taking a high position, and it is with much pleasure that we recall the fact of a recent visit which we paid to her residence and flower garden, and a conversation we had with her with reference to many kinds and varieties of plants we saw growing and blooming there, and especially some interesting observations on quite a number of new seedling carnations originated by her.

The grounds of the garden are in the eastern part of the city, fronts 200 feet on north side of Main street and runs back 400 feet, slightly sloping to the south, and, owing to its position near the main business avenues of the place and its charming display of sweet, rich flowers, it furnishes to visitors one of the most superior objects of interest to be seen within the city limits.

Mrs. Shepherd is, throughout the country, considered standard authority on the subject of varieties, exercises most excellent judgment in selecting the most valuable flowering plants for her large collection, and pays much attention to the addition of new varieties by growing seedlings from imported selections. She is largely engaged in growing seeds and bulbs of finest flowers for Eastern seedsmen. Possessing the rare advantages afforded by the peculiarities of the climate of Southern California, she has the ability to raise the seeds of a very wide range of kinds and varieties in the open grounds, when European florists would be obliged to grow in pots, making the rearing more expensive and the results much less satisfactory. Plants here in the open grounds have the benefit of ample room for roots, the great moisture of the atmosphere at night and the unobstructed sunlight of clear weather in most of the daytime, and in return grow their seeds to full maturity and perfection.

Among seeds, there are none more important to florists than those of the stock family, and especially the variety known as Giant Perfection, and while this fine flowering plant is most beautiful as a double flower, we should, of course, remember that all the seeds of stocks are grown from single flowers, as the double flowers are unproductive. We notice the extremely graceful habits of the growth of the Giant Perfection, this display of elegance being due principally to the long stems of the individual flowers. In this garden single flowers of this variety measure two inches across. Its habits of growth, the size of its flowers, its beauty of color and its perpetual blooming qualities, render this variety the king of all stocks. Mrs. Shepherd has grown many others, and says that if she were confined to one variety she would choose this one. We notice some volunteer plants from seeds of this variety which had fallen to the ground, and out of 30 we counted 24 double, and we may regard all as of first class.

In passing through Mrs. Shepherd's brilliant display of carnations—about 70 varieties—we observe a number of seedlings originated by her, all named and of most beautiful description, and will detail a few of the striking characteristics of some of the most valuable as follows:

Deademona—Color, soft, melting peach-pink, of deep shade, fringed, very large and regular in shape; most exquisite.

Mrs. Hamer—Pink, specially fine for corsage bouquets, 3 inches across.

Mrs. Page—Flat petals; very waxy pink; perpetual bloomer.

Romeo—White splashed and edged with wine color.

Mattie K. Saviers—Flesh color, splashed and dotted with wine.

Eva J. Leach—Flesh color, splashed and dotted with carmine.

H. C. Ford—One of the handsomest seedlings she has. A magnificent carnation of the Lydia type, of very large size. Lighter shade of salmon than the Lydia, marked and splashed with carmine, more distinct in the splashing of carmine. Named after the well-known artist, H. C. Ford of Santa Barbara.

Caroline Severance—Flowers very large, hang on long stems like great bells; combination of silver-gray and rose colors with a sort of metallic luster.

Dr. Dimmick—Rich carmine, with maroon pistils, beautifully shaped. Named for the late Dr. Dimmick.

Melia Newby—Rich, velvety maroon, fluted and fringed.

Ruth Morris—Daintily white, small, very pretty.

All these are fragrant and very handsome, with long stems, and most of them very fine winter bloomers.

Mrs. Shepherd has also some very handsome carnations, originated by a lady friend at this place, among which we will mention:

Dainty Darling—Nankeen salmon.

Maude Tait—Very large, peach-pink, not fringed. Both the above imbricated like the Hermosa rose.

Myrtle—Soft rose color, very large and deeply fringed; named for Mrs. Shepherd's eldest daughter.

Flavia—Pale yellow, with white stripe on each petal; imbricated.

There is one more seedling carnation, originated and named by Mrs. Mattie K. Saviers

of Hueneme, that we feel impelled to mention because of its exceeding beauty, viz.:

Theodosia B. Shepherd—Color, rose-pink, shaded with buff-salmon; has salmon center; stems long. A very distinct carnation, with one of the most striking and beautiful combinations of colors.

We see here a very handsome display of grandiflora verbena in variety, from some of which we take single flowers large enough to cover a 25-cent piece. We see some very large flowering petunias of rare qualities, presenting a profusion of lovely shades and colors.

Of chrysanthemums, Mrs. S. has at least 50 varieties and is able to raise two crops a year. She has some extra fine seedlings, one or two of which we must mention. One named Lamanda, for Mr. and Mrs. L. J. Rose of San Gabriel, from one of the Japanese varieties, a light yellow; another, Shower of Gold, which, when in full bloom, is described as literally looking like a shower of gold.

Mrs. S. has about 120 varieties of the fuchsia, and knowing, as all do, the very delicate texture of the flower of this lovely plant, with its white, wax-like, reflexed outside petals and richly colored centers, with its great range of shades, one may well imagine the striking effect of such a beautiful display as is here presented. She is experimenting on the propagation of new varieties in the practice of hybridizing, in anticipation of being able to produce striking results, and promises to report to the RURAL PRESS any novelties she may be able to produce.

Of the Amaryllis she has 16 or 17 varieties; also a large collection of Lady Washington geraniums and begonias in variety, and many of richest markings.

Mrs. Shepherd has succeeded in producing a double Canterbury Bell, exhibiting a marked peculiarity of flower—five distinct bells in each individual flower, one inclosed within another, the mouth resembling a rosette; the color a soft lavender tint; grew from seeds of last year. It has this year produced seeds which suggests the great probability of its peculiarity being perpetuated.

Mrs. Shepherd being a great collector of the best and most beautiful plants, we see here very many kept and cultivated only to fill out a collection of high order.

Admirers of the cactus family would here find a little world of those wonders of the vegetable kingdom, and we will mention by name the *Cereus triangularis*, a noted individual plant of which runs up at one of the front corners of the dwelling-house, very regular in its ascent, lying close against the wall and rising to more than the height of 20 feet. This is a most curious and beautiful object, and very attractive from its dark-green color and magnificent form, keeping a regular size from the ground to the terminal growth.

A noble specimen of the California fan palm tree stands in front of the house, and a handsome row of palms by the sidewalk in front of the garden, and on the inside a heliotrope hedge, with its dark-green leaves and lovely flowers.

Mrs. Shepherd has a quiet and attractive home, opening out from the rear of the dwelling into the garden, and, thus surrounded by the delightful influences of some of nature's most exquisite designs in the floral world, she and her family enjoy their happy lives.

Ventura Co.

McD.

THE STABLE.

The Horse in San Luis Obispo County.

The increase of population, the subdivision of the great ranches, and the appreciation in values of land demand progressive industry in husbandry. The history of San Luis Obispo shows it the most favored region in California for grazing, and the rearing of stock has ever been the chosen and most profitable avocation of its land-owners. In this great fortunes have been made, and the old residents now revert with tender feeling to the happy period of the past when their vast herds of cattle grazed at will over the broad ranches and fattened upon the succulent grasses. Comparatively few were the people dependent upon the products of the land, and their wants were so abundantly and so easily supplied by the self-producing and almost self-caring herd that little thought was given for improvement, and a better condition was deemed impossible. This was an idyllic state of happiness, a condition which to change was to destroy. But the world moved, a new population thronged to the grassy slopes of the Pacific and the change was inevitable. For long years San Luis Obispo maintained its isolation and its customs, ranking from the earliest time to the latest date as the great "cow county" of California.

A Great Step Forward

Was in changing from a cattle-growing region to dairying, and in that it has taken rank as the leading butter county of the State. These leading positions, cattle-growing and butter-making, are because of its superior grazing capabilities, its fertile soil, pure water and healthy climate. The country so favorable to cattle-growing is equally favorable to the rearing of horses, by far the most valuable animal, according to its kind, at the present day. In the cattle-breeding times, prior to the American conquest, the rancheros of San Luis Obispo boasted of their fine horses of the Spanish stock, descendants of the noble blood of Bar-

bary, imported by Cortez. But running wild and breeding indiscriminately it had so deteriorated that good animals were rare, and but little effort was made to improve them. They were condemned by the American immigrant as valueless mustangs and their rearing abandoned to the most thriftless of rancheros. Under this ban the native stock has almost vanished from sight. But there were some good horses in the olden time, and with proper breeding with suitable American horses a fine stock of roadsters were produced, excellent for the stage and ordinary work. In the history of the conquest of California is related the

Famous Ride

Of Col. Fremont and Don Jose de Jesus Pico from Los Angeles to Monterey and return, in March, 1847, a total distance of 840 miles, in 76 hours, using one relay of horses. From San Luis Obispo Colonel Fremont took two horses, a present from his friend Pico, riding one or the other alternately. Upon arriving at Monterey, he was ordered to return immediately to Los Angeles, and the departure and ride to San Luis Obispo is thus graphically told by Father Colton in his book at that time, as an example of the spirit and endurance of the horses of the period:

"At 4 o'clock in the afternoon of the day preceding their arrival, the party were ready to set out on their return. The two horses rode by the Colonel from San Luis Obispo were a present to him from Don Jesus, who now desired him to make an experiment with the abilities of one of them. They were brothers, one a year younger than the other, both of the same color—cinnamon—and hence were called

El Canelo or Los Caneles.

"The elder was taken for the trial, and led off gallantly as the party struck the plain which stretches toward the Salinas. A more graceful horse, or one more deftly mounted, I have never seen. The eyes of the gathered crowd followed them till they disappeared in the shadows of the distant hills. Forty miles on the hard gallop and they camped for the night. Another day and the elder canelo was again under the saddle of Colonel Fremont, and for 90 miles carried him without change and without apparent fatigue. It was still 30 miles to San Luis, where they were to pass the night, and Don Jesus insisted that canelo could easily perform it, and so said the horse in his spirited look and actions, but the Colonel would not put him to the trial, and shifting the saddle to his younger brother, the elder was turned loose to run the remaining 30 miles without a rider. He immediately took the lead, and kept it the whole distance, entering San Luis on a sweeping gallop and neighing with exultation on his return to his native pastures. His younger brother, with equal spirit, kept the lead of the horses, under the saddle, bearing on his bit and requiring the constant check of his rider. The whole eight horses made the 120 miles each in this day's ride, after having performed 40 the evening before."

This celebrated ride has formed the basis of many speeches and tales eulogistic of the riders and the endurance of the native California horses, commonly derided as mustangs.

After the Conquest

And the influx of Americans upon the discovery of gold, the horse of the new-comers took precedence, and no effort was made to improve the Spanish stock. San Luis Obispo continued a "cow county," and the native horses served the purpose of the vaquero. Vehicles were rare and draft horses not required. As a saddle horse in herding cattle, the hardy mustang was the animal that pleased the people. Occasionally an American stallion was brought into the county, but little attention, however, was paid to breeding, and the results were hardly appreciable.

Not until 1875 was any determined effort made to improve the stock of horses in this county. Then Mr. H. S. Rembaugh, one of the proprietors of the *Tribune*, who, in his paper, had often animadverted upon the wild manadas and runs of stallions running over the unfenced valleys and hills of the luxuriant pasture-land, breeding a stock of horses that were an eye-sore to men of enterprise, determined to make an effort to change the order of things. He therefore went to the famous blue-grass region of Kentucky, noted for its fine horses, and conferred with Gen. Withers, a distinguished turfman and expert in horse-flesh, and under his advice purchased the well-bred stallions

"A. T. Stewart" and "Altoona."

Mr. Rembaugh was impressed with the belief, which is entertained with good judgment at this time, that California was destined to become the breeding-ground of the finest race of horses the world ever saw, and that San Luis Obispo possessed peculiarly favorable advantages for taking the lead in the enterprise. His evidence of that faith was his venture of investing his fortune in the work, inaugurating the movement of progress with the utmost confidence of success. His steps were well taken, and if his pecuniary reward was not commensurate with his enterprise, the honor of the achievement must be awarded him.

Returning with these, he started a stud-farm on the southern borders of the town of San Luis Obispo. The horses were noble specimens of their race. A. T. Stewart was described at that time—the spring of 1876—as a beautiful dark brown, with tan muzzle and flanks, four years old, 16½ hands high; good length, bone and substance, weight 1285 pounds, of com-

manding presence and speed and action in keeping with his high breeding. He was sired by the celebrated getter of trotters Mambrino Patchen, full brother to Lady Thorne and sire of Lady Stout, three-year-old record, 2:29, the fastest time ever made by a three-year-old. First dam the Harris mare by Mambrino Chief, sire of Lady Thorne, second dam by Young's Pilot, Jr., son of the famous trotter Pilot.

This excellent horse was put to service, remaining a few years, producing a fine succession of colts, strongly resembling the sire, of good size, free, fleet and strong. The stock is frequently seen in the county and is the pride of their owners. But the time had not come to make fine horse-breeding profitable, and Mr. Rembaugh, meeting the usual fate of pioneers in enterprise, failed and the noble animal was sold and taken from the county.

Altoona

Was but a yearling when brought to San Luis Obispo. A beautiful bay, a fleet trotter and a lofty carriage, he has grown to be the pride of the county, now being the property of Hon. George Steele. Altoona was foaled in 1875 on Fair Lawn stock farm, Lexington, Kentucky, the property of General W. T. Withers, the breeder of A. T. Stewart. He was sired by Almont, son of Abdallah (sire of Goldsmith Maid). Altoona's dam was Theresa B by Prophet, Jr., a descendant of Vermont Blackhawk. Almont's dam was by Mambrino Chief, second dam by Pilot, Jr., thus showing a distant relationship to A. T. Stewart.

As these high-bred trotting horses were the pioneers of their time and of the first to give character to horse-breeding in the county, their pedigrees have been given, a distinction which space will not permit for the many excellent horses that have followed them in the field. The list is now a long one and comprises different breeds, English thoroughbreds, Normans, trotters, etc.

Of these high-bred and valuable stallions may be named Silver Duke, Fallon, Crown Prince, Jr., Debay, St. Elmo, Moreau of the Norman stock, Sir Edgerton, English thoroughbred, Electioneer, Duke McClelland, Adjutant, Alexander, Jr., Alallen and A. T. Stewart, Jr., of the trotting stock, and others, progeny of those named. There are also others not so well known but of great value.

At the Present Day

There are a great many fine horses in San Luis Obispo. Wheeled vehicles have taken the place of the saddle in transportation, and the teams seen to day are a great improvement on those in use but a few years ago. The revolution in horse-breeding is effected, and the people are beginning to appreciate the results. It remains to consider the business as profitable husbandry. No one will question the assertion that this coast region is most particularly adapted to the rearing of stock. Horned cattle have been the resource of the past, and will not a higher grade of animals become a much

Profitable Production?

The land that has made its owners fortunes in growing vast numbers of low-priced animals will make a greater fortune in growing more valuable ones. Breeders well say that it costs little, if any, more to raise a horse that will sell for \$250 or \$500 than to raise one that will sell for but \$25 or \$50. There are many farms from 200 to 500 acres where but a bare living could be made in growing wheat or hay or in dairying, but should these be stocked with a good class of brood mares to be bred with a first-class stallion, a horse to every 20 acres could be sold every year. All the brood mares could be worked the greater part of the year carrying on the farm or teaming, and earning the support of the farmer's family, having the returns of the stock sold as a net income. To no better use could good pasture or hay land be put. Of course capital would be required to stock such a farm, according to its acreage and the style of stock put on it or bred from. Brood mares costing \$100 each and paying from \$20 to \$30 service can bring colts worth at three years old from \$200 to \$500 each at lowest rates and often much higher. Good draft horses sell readily at from \$400 to \$800 a span in the large cities, and first-class carriage horses command fancy prices. As the country advances in wealth and the cities increase in population more fine horses are demanded, and

The Market

Is continually enlarging. In this there is never an oversupply, nor is the market endangered by foreign competition. In this healthy climate dangerous diseases are unknown, and should any appear the horse is easiest guarded or removed of any species of stock. Should a disastrous drought prevail the horse is able to earn his own living on imported food or go where there is better. Thus the business is less liable to danger than any other branch of husbandry, and moreover is the most pleasant as the horse is so helpful, so handy, the companion and pride of man. From the earliest dawn of civilization the horse has borne this relationship to the master of the animal kingdom. The general in the field at the head of an enemy is a pigmy on foot, but becomes a power and demi-god when mounted on his prancing charger. The horse is the ideal of grace, of courage, of majesty and of power. He is man's help-meet in labor and his crown of glory in pleasure. While man lives the horse will be his pet and companion, and for him he will pay all the price his purse can bear.—*Myron Angel in San Luis Obispo Tribune.*

THE FIELD.

Sugar Beets at Fresno.

University Experiment Station, Bulletin No. 72.

The culture of the sugar beet in the San Joaquin valley has until lately remained a bare suggestion. It is well known that they have been successfully grown near Isleton and Sacramento, on the moist lands of the Sacramento river, on which irrigation is unnecessary. It is doubtful that the sugar beet has ever been cultivated where irrigation is indispensable, and this fact, as well as the high summer temperature of the southern valley, has discouraged the attempt. In fact, the very idea of a root filled full of irrigation water, and then wilted by the torrid heat, is enough to excite the antipathy of the manufacturer.

The success of the sugar beet in Los Angeles, however, encouraged the hope that with a proper selection of soil and of the time of planting and irrigation, a root suitable for the sugar-maker might be produced in the San Joaquin valley; and, if so, that the crop might be made to supplement that of the coast valleys so as to prolong materially the annual campaign, the shortness of which is a heavy charge on the capital invested in the somewhat costly plant of beet-sugar factories. As stated in a paper on the subject, published in the December number of the *Overland Monthly*, the campaign period in Europe usually does not much exceed three months—October, November, December—while in California, owing to the favoring climatic conditions, there is no difficulty in lengthening it to the five months from September to January, both inclusive. If by early sowing in the precocious season of the Upper San Joaquin two or three months more could be added to the time of campaign, it would place beet-sugar production in this State on a ground of vantage from which it might calmly defy the competition of its tropical competitor, the sugar-cane.

Preliminary experiments to test the feasibility of growing good sugar beets under the condition of the Fresno climate have, during the present season, been made by Mr. M. Denicke of Fresno. Mr. D. obtained last autumn from Mr. Dyer of Alvarado, some reliable sugar-beet seed, and sowed it at intervals from December to April. The results of the examination of three lots, planted and harvested as stated below, were as follows:

Lot No. 1.—Seed sown in December, harvested May 27th. The lot consisted of four roots, two of which (A) showed just an indication of new growth starting in the center, while in the two others (B) a short seed-stalk was already formed, so that they had evidently passed the proper stage for sugar-making.

Lot No. 2.—Two beets from seed planted early in April by Mr. L. J. McCleary, on sandy, ashy soil on King's river, six miles east from Selma. Harvested June 26th. Little or no indication of new growth starting.

Lot No. 3.—Two roots. Seed sown about March 15th, on "white-ash" soil. Harvested June 29th. Somewhat fresh-looking in the center but no serious show of new growth.

Lot No. 4.—Date of sowing not stated. Roots in good apparent condition. Harvested August 4th. The assays resulted as follows:

ASSAYS OF FRESNO SUGAR BEETS.					
Lot.	No.	Sown.	Harvested.	Average Wt. of Beets.	
				Purity.	Per Cent.
Lot No. 1	A	Dec.	May 27	21	10.1
Lot No. 1	B	Dec.	May 27	24	7.0
Lot No. 2		Apr. 10	June 26	18	10.5
Lot No. 3		Mar. 17	June 29	22	12.6
Lot No. 4		?	Aug. 4	25	13.2

With regard to the data in this table it should be stated for the benefit of the general reader that roots having an average of 10 per cent of cane sugar and a purity coefficient of 80 (that is, 80 per cent of cane sugar in the total solid contents of the juice) would be considered a fair workable material by the sugar-maker. But a higher sugar per cent in the juice may offset a lower degree of purity, and vice versa.

It will be noted that the average of the three first lots (leaving out of consideration lot 1, B) is 11.1 per cent of sugar with a purity coefficient of 81.4; they are therefore amply within the limits stipulated by the sugar-maker. As for lot 1, B, the fact that the roots had begun to throw out seedstalks shows at once that they had passed beyond the limits within which the crop should have been harvested. I conjecture that this growth had been started by untimely irrigation. As for lot 4, although it shows a somewhat higher sugar percentage than No. 3, its lower purity coefficient would nevertheless render it less desirable as it stands; but the appearance of the roots suggests in this case, also, that the time for harvesting had passed by.

Considering that the persons growing these beets were without experience in the premises; that, in fact, irrigation has probably never been before applied to the production of sugar beets; and that the right time and the proper amount must in this case be considered as at least equally as important as in the case of wine grapes, the results thus obtained are exceedingly encouraging. They imply that in Middle California the working campaign for sugar

beets can very probably be extended through the months of June, July and August, making it reach from June 1st to February 1st; and considering that the beets of the first lot had already passed their best condition by a week or two, and that with somewhat improved arrangements for the preservation of the late-grown beets they can probably be carried to the middle of February, we can foresee the possibility of such an extraordinary feat as an eight-months' campaign of a beet-sugar factory, running on fresh beets. With the additional possibility of utilizing beets sliced and dried under the same conditions as the raisin crop, the full 12-month may ultimately be called into requisition.

It must, however, be remembered that in order to realize such results, it must be feasible to bring the beets of the San Joaquin valley and those of the coast valleys within reach of one and the same factory plant. The roots will not bear railroad transportation to any distance; but with cheap water transportation it might be feasible to let the crops of Fresno and Merced start up the factories located in the upper bay region, in June, and to keep them running until the middle of February by supplies from the coast region.

It is to be hoped that more extended and carefully guarded experiments will be made the coming season, even if the omission of Congress to render the Experiment Station bill effective by means of an appropriation should not be made good in time. E. W. HILGARD.

Berkeley, Aug. 12, 1887.

The Hessian Fly and Resistant Grains.

In Bulletin No. 58 of the University Experiment Station (issued Oct. 9, 1886) is given a sketch of the results of an experiment made in 1886 to test the resistance of a large collection of grain varieties to the attacks of the Hessian fly (*Cecidomyia destructor*). The annual report for 1886, which is now nearly ready for distribution, will contain a fuller account of the same experiment. For the purpose of verifying the results of last year, and at the same time to determine other points in view, the full collection of cereals was resown in 1887, on the same fly-infested ground. In addition to the varieties sown last year, there were a number of new sorts, some selected with special reference to their supposed resisting quality.

The present announcement is for the purpose of giving early notice of the varieties which gave best results, and in some cases to compare the outcome of two years' trial. A full consideration of other points involved in the experiment will be reserved for the next annual report. The following table gives the behavior of certain varieties of wheat under attack by the Hessian fly:

VARIETIES OF WHEAT AND THE HESSIAN FLY.		
Name of Variety.	1886.	1887.
	Sown February 25th.	Sown January 24th.
Missoyen	Small crop, but no fly found.	Good crop; no fly.
Palestine	Fair crop; no fly.	Good crop; no fly.
Petali	Fair crop; no fly.	Good crop; no fly.
Volo	Good crop; no fly.	Good crop; no fly.
Atlanti	Small yield; no fly.	Good crop; very few flaxseeds.
Forelle	Fair crop; no fly.	Fair crop; no fly.
Common March	Fair crop; very few flies.	Good crop; no fly.
Diamond		Good crop; no fly.
Ex. Early Oakley	Failure; abundantly infested.	Good crop; very few flies.
McGeehee's White	Failure; largely infested.	Good crop; no flies.
Polish	Fair crop; somewhat infested.	Good crop; no flies.
Red Sea	Failure; badly infested.	Good crop; no flies.
Victoria	Not sown.	Good crop; no flies.
Brenner White Club†	Not sown.	Poor yield; no flies.
Winter Crimea	Not sown.	Good crop; no flies.
Nicaragua	Not sown.	Good crop; very few flies.
White Genesee	Fair crop; slightly infested.	Fair crop; very few flies.
Raub's Black Prolific	Not sown.	Good crop; no flies.
Winter Fulcaster	Not sown.	Good crop; no flies.
Russian Red Beard	Not sown.	Good crop; some flies.
Centennial Black	Nearly destroyed.	Good crop; some flies.
Big White Club, Oregon	Poor; abundantly infested.	Good crop; few flies.
Diehl's Mediterranean	Failure; abundantly infested.	Fair crop; few flies.
Egyptian	Failure; abundantly infested.	Good crop; few flies.
Faltz	Failure; somewhat infested.	Good crop; some flies.

*Seed sown in 1886 was very old, from museum specimen; growth of 1886 resown in 1887.
†Old seed from museum collection.

The foregoing are a few varieties chosen from over 150, which have been tested this year, and they are selected with a view of pointing out some of the most obvious conclusions concerning resisting quality.

First: The value of early sowing is apparent, for it is shown that quite a number of varieties which yielded entirely to the fly last year were able this year, by having a growing season a month longer, to pull through and make a fair to good yield on the same ground that they failed on last year. At the same time it appears that the time of sowing does not fully hold the key to the situation, for some varieties were destroyed both years. The full report will show more instances of this kind than it is thought worth while to cite at this time.

Second: That the resisting quality inheres in the variety largely, is shown by the continued resistance of the varieties which succeeded last year, and which were therefore sent out for experiment in fly-infested districts

last winter. These varieties are the first six enumerated in the table above. In most of these cases an improved yield was secured by earlier sowing this year, but whether yielding little or much, they had the same distastefulness to the fly.

Information Desired.

This brief statement is made chiefly with the design of drawing out reports from those to whom we sent resisting varieties for trial. Such local experience will be of great value in the full discussion which is contemplated. We desire not only the facts of yield and behavior of these varieties themselves but a comparison of them with other varieties commonly sown in the localities; also what is the conclusion of the grower of the value of these strong growing dark varieties, either for home use or in the market.

During the year we have been in correspondence with Miss Eleanor A. Ormerod, Consulting Entomologist of the Royal Agricultural Society of England, in reference to the Hessian fly and its work. Miss Ormerod announced the discovery of the fly in English grainfields in July, 1886. Up to that time its presence had not been observed. Miss Ormerod's tenth report contains a very interesting description of her investigations and study of the insect. One point on which Miss Ormerod desires the observation of others who may be handling fly-infested grain is the point at which the flaxseeds or puparia are deposited in the process of thrashing. She did not find them in the cleaned grain nor in the chaff blown out by the fan, but found them in great abundance with the screenings which in English practice seem to be deposited just beneath the machine. The point of deposit in California would depend upon the kind of cleaner which is used with the thrasher. We would esteem it a favor if any reader who may have opportunity to make examination on this point would send us the results. The puparia are called "flaxseeds" from their resemblance thereto. They are generally about one-sixth of an inch long, smooth, spindle-shaped, or pointed at both ends, and of different shades of chestnut color. When very thickly crowded in the stem, they are irregularly compressed but would still be recognizable. We shall be glad to receive notes on the occurrence of such bodies in screenings, and to receive small samples of screenings which may be thought to contain them. Of course if it is found that these bodies are largely aggregated by the process of thrashing, measures can be taken to somewhat reduce the pest by treatment of the screenings, which is calculated to destroy the insect when in this form. Such measures, coupled with burning the straw and stubble right after removing the grain from the field, would seem to be a serious blow to the increase of the fly. Our experi-

POULTRY YARD.

An English Opinion on Incubation.

1. Procure good-constitutioned eggs. 2. Withdraw your eggs once a day from the incubator for 20 minutes at least. 3. Dip them in tepid water before replacing them. By good-constitutioned eggs I mean such as are produced from a farm where the poultry have a good run, and where the proportion of one male bird in seven is maintained. Moreover, the male birds should be drawn from an entirely different strain, and be in no way related to the hens. It is also essential to remember that the eggs of the first few months in the year produce much finer chickens than later ones. Eggs hatched in August or September are worthless, the chickens always being poor and stunted. When setting a hen the best results will be produced by setting her in the darkest and dampest corner of an outhouse on the ground. She must then be lifted off her nest every day and placed under a coop to feed for half an hour, and the eggs sprinkled with tepid water before she is allowed to return to them. Under such circumstances she will frequently bring off the whole brood, or at least 16 out of 17. To prevent disappointment it is a useful practice to test the eggs. Supposing that, in the case of hens, you set half a dozen the same day. When they have set two days you can test all the eggs, reject any bad ones, make the six settings into five, and reset the sixth on fresh eggs. Testing is easily accomplished as follows: Take a piece of cardboard, exclude all light from the setting-house except a candle, or better still, a reflector-lamp. Take the eggs one by one and hold them sideways against the hole in the card; then hold them up to the candle or lamp, so that the card is between the light and the egg. It will be seen then in the case of a fresh egg, which has not been set on, that the egg is semi-transparent, but when the egg has been set upon for two days, an opaque body will be observed floating about in it. This will be more readily seen if the egg is gently revolved while thus held up. This dark body means that the egg has germinated and is a good one. But if the egg remains clear after two days it is not a fruitful one and will not hatch. The matter can be made quite a certainty by the third day.

Hints on Hatching.

It is hardly the time for setting hens yet, but the weeks roll around fast and setting-time will come soon enough. It is the general opinion that early settings are better than late, so it is well enough to think over methods. We find in the *Southern Cultivator* some hints on setting which are of interest. H. B. Geer writes as follows: We place the nests for our setters right on the ground. It is customary with me to make the nests after this fashion: First, select a rather secluded spot in or about the chicken-house and loosen up the earth. Then I wet it thoroughly and place about it a wooden frame with neither top nor bottom. Then fill in on top of the wet earth with dry dirt to the depth of two or three inches, shaping it into the right form for a nest. Within this space put fresh green grass, and on it place the eggs. The result is a cool, moist nest, that is both gratifying to the hen and beneficial to the eggs. And as a result, nearly every egg hatches. When hatched, however, I do not take the chickens from the nest until the youngest one is fully 24 hours old, for I believe they need hovering more than food during the first day of their existence. From the nest they are taken to a rat and cat-proof canvas-covered bottomless coop, which is inside of a chicken-proof pen about ten feet square. Sawdust or sand is placed inside the coop and the hen and her brood deposited there directly from the nest. The hen is fed first on whole grain, and then when she is pretty well satisfied, the first feed for the little chicks is placed before them, which consists of hard-boiled egg and potato crumbled up together. The potato is alternated with oatmeal uncooked. A little meat is given them every other day and occasionally a little red pepper with their food of a morning. The hen is thoroughly dusted with Persian insect powder as soon as taken from the nest, and twice a week thereafter for the first three weeks. The chickens are fed four and five times a day as above described, and they thrive wonderfully when so cared for. They are allowed all the fresh water they desire.

EGYPTIAN CORN.—Mr. C. A. Starkweather brought to the Stockton Independent from about eight miles north of Oakdale a stand of Egyptian corn as a sample of the crop he has raised without irrigation on 100 acres of summer-fallowed land. Mr. Starkweather informed a reporter that he planted the Egyptian corn as an experiment, and he was perfectly satisfied with the result, as showing the adaptability of the plain land of the San Joaquin valley for such productions. There is very little Egyptian corn raised in this section, but there is a good demand for it. It is an excellent food, either pure or mixed with other grain, for poultry, and Mr. Starkweather is of the opinion that there is no reason why it should not be good food for hogs and cattle.

ment this year included a large collection of varieties of barley. The results, which will be more fully discussed at another time, show that barleys were much less seriously affected this year than last, and that a number of kinds which failed last year gave very satisfactory returns this year. E. J. WICKSON.

Berkeley, Aug. 12th.

TO KEEP FLIES AWAY.—Geo. E. Doering, Ph. D., informs one of our medical journals that an alcoholic solution of oil of wintergreen rubbed on the marble slab of a soda fountain will keep the flies away and not prove disagreeable to customers. It is well known that all essential oils are poisonous to insects. If from soda fountains why not from all other places?

CANNERS and driers at Santa Rosa cannot get sufficient help to handle the fruit crop. That is the complaint in nearly all the fruit-growing sections of the State.

PATRONS OF HUSBANDRY.

Correspondence on Grange principles and work and reports of transactions of subordinate Granges are respectfully solicited for this department.

The Worthy Master Away from Home.

[NUMBER 6—CONCLUDED.]

[Written for the Rural Press by Mrs. W. Johnston.]

June 28th arrived and with it the Australia, bringing us letters and papers from home. How we longed to hear from those loved ones! How eagerly we snatched at every particle of news from the world at large! None can appreciate the dispatches of our daily papers until they are deprived for a season of the privilege of seeing them.

Next to attract our attention was a concert, given by a native amateur club, to raise funds for the benefit of the native church now nearing completion—so near, in fact, that they were holding services in the basement. I am proud to say that the Masonic excursion party, in this case as in all others, responded promptly to the call and did their part in behalf of the good cause. The opening song was "America," sung in English by 15 young men—natives—who pronounced every word so distinctly that had we been at home, or their dark faces veiled from view, we should have thought them a party of Americans, fully inspired with love of their country and mankind. This was followed by a number of native songs, well rendered, some of which seemed so plaintive and the music so charming that we really enjoyed them, although we understood but few of the words. The entertainment was closed with a tableau, representing the killing of Capt. Cook. This at first seemed strange—to represent murder in order to raise funds to build a house for the worship of God; yet when we read His word, we find that in no instance would He permit a man to live who allowed himself to be worshipped as God, but by some means caused his life to be taken. Cook was such a man, and taking this view of the case the tableau was quite appropriate, after all.

Preparations were already under way to have a grand celebration July 4th. Money was freely subscribed by the American residents to make a gay day of it, and well did they succeed. The site chosen was a park on King's street, a very appropriate place. The ground was thickly carpeted with a sod of Bermuda grass and dotted over with beautiful trees. A stand had been erected for the speakers, seats provided for the company and a platform laid for the dancers, so that the comfort and pleasure of all was assured.

The American minister headed the program, and was chairman of the day. W. M., Atkinson, read the Declaration of Independence, after which talented speakers entertained the large and appreciative audience. The King's band furnished music for the occasion. Mr. Merrill announced that a reception would be given by himself and wife at their cottage in the afternoon. Many availed themselves of the pleasure of attending this very social affair. The cosy little cottage seemed truly American, with the stars and stripes floating high over our heads in the yard, and over each door a flag was gracefully draped, while smaller ones were artistically arranged in clusters and designs. All who called were warmly received and made to feel at home by the host and hostess.

The time for starting homeward drew near, and we were all anxious to leave a Government that was already in the hands of a mob who threatened to detain our boat until all their demands were acceded to. These threats caused much uneasiness. In due season, the hour of departure arrived, and even then, after all preparations necessary for the voyage had been made, we felt there was a possibility of being detained. But our fears proved groundless. Our landlord provided bays or wreaths for all his guests who boarded the Australia that day, and we were truly glad when the round of festivities was over and we were once again installed in our narrow quarters on board.

It is a strange sight to see a party leave Honolulu—each one decorated with bays and wreaths. So general is the custom among the natives that it is considered a mark of disrespect, and shows you have no friends if you leave the islands unadorned by one or the other. Some of the natives who came over with us were completely covered with wreaths of green and bays of flowers.

A large crowd came down to the pier to bid us good-by; also the King's band to cheer us for the last time. I could but feel a tinge of sadness as we moved slowly out through the rainbow-tinted surf, and took a last look at the city that had furnished us so much enjoyment. Many of the inhabitants were greatly troubled over the revolution that the Government was then passing through.

Before land was out of sight that disagreeable feeling of seasickness began to creep over a large majority of those on board, and by morning many were unable to respond to the breakfast-gong. We had a stiff head wind all the way, making slow progress, and the rough sea greatly aggravated seasickness. The last night out the boat rolled fearfully and the waves dashed so wildly that they washed clear over the hurricane deck and poured down on the dining-table. One terrific surge threw a bucketful of Spanish mackerel on the bow of the boat, which seemed truly like manna in

the wilderness, for they were quite a treat at the closing of so rough a trip. By the time we had feasted upon this delicious fish, we were nearing the Golden Gate and seasickness was rapidly disappearing, as we began to feel impatient to touch land again.

In due time we got ashore, and were placed in the hands of the Customs officers to whom an account of our baggage had to be rendered. All this well over, we bade our friends good-by and scattered to our respective homes.

Pomona's Service at the Fairs.

At the monthly meeting of the Sonoma County Fruit and Grape Growers' Association, held July 30th, the *Democrat* says that a good deal of deliberation was had as to making the most worthy and effective manifestation of the county's resources. It was generally conceded that hearty co-operation should exist between the various committees and the Pomona Grange committee. The Grange is much better prepared with all the paraphernalia and to a great extent with the material for a large exhibit than any other organization in the county.

Mr. Rogers urged that Sonoma has abundant reason to put forth every effort in her power this year. The other counties are envious of the success she has achieved, and would compete strongly for the honors.

The discussion finally gave birth to the idea in the minds of a few of the members that it would be wise to dissolve the Committee on Mechanics' Fair Exhibits, and resolve the entire association into a committee of the whole to co-operate with the Grange Committee, for the attainment of the success of the common cause. After some little discussion, the idea was reduced to words in a motion made by Mr. White. The motion was carried.

President Whitaker stated that any who might desire to make an individual exhibit at any of the fairs where the Pomona Grange is to be represented can do so under the supervision of the Grange, if agreeable, and such displays will receive every attention necessary free of charge.

Mr. Adams stated that the collection made by the Grange this year would be twice as large as the one of last year. As the speaker continued, he grew enthusiastic on the subject of the county's eminence in agriculture, horticulture and viticulture, and opined that no other county in the State could even approach a standard of comparison with old Sonoma. He referred humorously to the manner in which the farmers and enthusiasts in agriculture had showered contribution after contribution of every variety of product upon the Exhibit Committee at the fairs last year. The committee was literally covered up with sheaves of wheat, barley, oats and samples of the various products of the soil, and was compelled to improvise ingenious methods for their display. Extra tables and sub-tables, benches and sub-benches were constructed—in fact, they had a flight of steps, reaching from the floor to the ceiling, and presenting an array imposing and magnificent.

At the supervisors' regular monthly meeting, August 1st, the sum of \$300 was appropriated to Pomona Grange to enable it to make a suitable showing of Sonoma products at the State and Mechanics' Fairs.

The Gridley Monument.

The statue of Gridley was imported June 10th, and the duty upon it was paid by W. C. Townsend. A dispatch from Washington, 3d instant, states that the Secretary of the Treasury has decided that he has authority to refund the duty and will do so.

The Stockton *Independent* mentions a meeting of the Monument Committee, on the 6th, at which the sub-committee appointed to receive the monument reported that the work had been performed in a satisfactory manner.

A communication was received from Mrs. Gridley, stating that she would be satisfied with whatever action the committee saw fit to take in the matter of an inscription and inclosing the following data for their information: "Rael Colt Gridley; born in Hannibal, Missouri, January 23, 1829; died in Paradise, Stanislaus county, California, November 24, 1870, aged 41 years, 10 months and 1 day."

Admission Day, Sept. 9th, was fixed as the date for unveiling the monument, and a committee consisting of Fred West, H. S. Sargent, and one from the Pioneers and the Grangers, was appointed to make arrangements for the ceremonies. The choice of an orator rests with this committee. Justice Paterson of the Supreme Court sent a communication to the General Committee regretting that a pressure of official business would prevent him from attending the exercises.

SANTA ROSA GRANGE is receiving applications for membership at every meeting. The fourth degree has just been conferred upon a class of three, and another class is waiting for the first degree. A special meeting of the Grange has been fixed for Saturday, Aug. 20th. The members at Santa Rosa are making great calculations for the State Grange. A large attendance and a good time are confidently expected.

The young Grangers of Danville give a social dance in Grange hall at that place on Friday of this week.

Grange Insurance Companies.

[By M. WHITEHEAD, National Lecturer.]

Perhaps in no more marked manner have farmers proven their ability to look after their own business interests, through organized effort in the Grange, than in the many successful Grange fire-insurance companies that have been started and are now running successfully in many States. Literally, they are saving millions of dollars to farmers every year. And how simply and plainly it is accomplished! In the old way the farmer who insured his buildings paid, in addition to the amount really required to cover the risk, local agents' commissions, general agents' commissions, large salaries of officers, cost of expensive headquarter buildings, amount added to "surplus" of the company (undivided property), dividends (divided profits), greater risks and therefore expense of city fires. Under the Grange plan he pays only for the fires and the exceedingly small sum required to run the company.

The State Insurance Commissioner of Massachusetts is authority on insurance matters. Two years ago, in his annual report, he said:

The too great cost of insurance challenges the attention of a frugal public. We pay too much for insurance protection. Plainly it should not, as for a quarter of a century it has, cost the people of this country \$100,000,000 and more to protect themselves by insurance against \$60,000,000 loss of property by fire.

In his last report (1887) just issued, the Commissioner continues:

Two elements make up the cost of insurance, (1) the payment of losses, and (2) the expenses of carrying on the business, which, if conducted on the stock plan, includes profits to the capital engaged in it. These may be termed the lost cost and expense cost. The expense cost was the larger part of the cost of fire insurance in 1886 to the people of Massachusetts. The same is true of the year before. The popular discontent with the expensiveness of fire insurance protection is manifesting itself in efforts to cheapen it by avoidance of needless expense in the transaction of the business and by expedients to prevent loss. A great influence is exerted by the mutuals, which save the expense of capital, and escape the burdensome charges for procuring business in the form of commissions to agents and brokers.

These insurance lessons are among those that farmers have been learning in their Grange halls, and many companies are now in successful operation in different States. In the Jefferson County (N. Y.) Patrons' Fire Relief Association the cost for insuring \$1000 was \$2.18 for five years, and in the Chautauqua County (N. Y.) Patrons' Fire Relief Association, \$1.76 for three years.

The following report of 61 co-operative companies, submitted to the State Grange of New York in 1883, shows what the farmers of that State are saving in the item of fire insurance: Number of policies in force, 31,143; amount of risks in force, \$61,761,715; average amount of each policy, \$1983.16; average cost of \$1000 three years, \$1.84; cost of insuring \$61,761,715 three years, at \$1.84, \$113,641.66; cost of insuring same amount three years in stock companies, at \$8 per \$1000, including survey and policy, \$494,093.72; difference in cost, \$380,452.16; interest on difference in cost for three years, \$68,481.39; total saving to the policyholders in the co-operative companies for three years, \$448,933.55.

One of the oldest of these Grange mutual fire insurance companies, "The Farmers' Reliance," of N. J., gives the following figures in its last annual report: Whole amount insured, \$1,298,550; running expenses one year, \$131.35; increase of business for the year, \$150,000.

The charge that property insured in mutuals fares much worse than that insured in stock companies, is, says Commissioner Tarbox of Massachusetts, "so wild and reckless of the fact, that, in justice to the system it unfairly assails and in defense of the true history it falsifies, it must be challenged." He proceeds to quote the actual results among the companies bankrupted by the Boston fire of 1872, and shows that the superiority of specific capitals over associated mutual liability, as a basis of insurance, is not apparent. "The losers by the Boston fire found the mutual obligations of the mutuals more efficient than the cash capital of the stock companies for their protection." When it is remembered that the parties comprising a farmers' co-operative insurance company would be even more likely to fulfill their obligations in case of necessity than a city company, the strength of the system is apparent.

Again, Grange insurance companies only insure the buildings of "Patrons in good standing"—selected risks. And farmers' fires are not great city conflagrations, which, starting from one small fire burn up hundreds, perhaps thousands, of their risks besides. Farmers' companies cannot be broken up in that way; their risks are isolated, scattered.

BUSY GRANGERS.—The Stockton *Independent* of last Sunday says that the committees appointed by the San Joaquin Grangers to collect specimens of the county's products for exhibition at the State fair, and the later fair to be held in Stockton, have been very successful in their work, and secured excellent samples of all kinds of grain grown in this section of the State. A committee of ladies is now engaged in arranging the samples for exhibition, and the male Grangers look wise and say that this year's exhibit will be larger and better than ever before. A number of the ladies interested visited the new pavilion on Saturday to spy out a location for their attractive display.

They want the most prominent space in the new structure, and the management of the association seem in no wise averse to giving the energetic Grangers just what they desire.

The State Grange.

There will be a large attendance of Grangers at Santa Rosa the first week in October. Our advice to those who have never seen the thrifty county seat of Old Sonoma, is, by all means, to attend. The ride from San Francisco occupies but two hours, and the trip is a very pleasant one.

Special arrangements have been made with the S. F. & N. P. R. R. Co., so that round-trip tickets, good for ten days, will be issued for the small sum of \$2. All the hotels in Santa Rosa have given special reduced rates, which will be published in due time. One of the most commodious and handsomest halls in California has been secured for the sessions of the Order. The Feast of Pomona will be a sight worth all the labor, time and money it will cost any one to attend the State Grange.

Santa Rosa Grange is one of the live organizations of the State. They know how to entertain, and will spare neither toil nor coin to make a success of the occasion. They have committees appointed and at work—and working hard—to arrange every detail. The election of officers of the State Grange, of itself, ought to call out a large attendance.

Let all who can, attend the next session of the State Grange to be held in Santa Rosa. They will see a fine country and a neat and thriving city; they will have a good time themselves and should assist others in having a pleasant visit, and, all in all, a week will be devoted to a good cause by a good people.

Literary Day at Sacramento Grange.

EDITORS PRESS:—A good attendance of members graced the hall to-day, notwithstanding the busy season in field and orchard. The sisters came out in full force, but the brothers were called upon to look after the ice-cream, furnish their own cake and wait on the fair sex. You may imagine the variety and delicacy of the cakes that each had to provide with his own hands after rambling over many pages of cook-books! Of course it was all done in the latest mode. It was gay, picturesque and—well, we passed the ordeal; but it would not do to repeat too often—the cost of skill would suffer by their hands. The charge was gently laid at their feet for further time, when they were not so busy. Adieu, cakes, etc.

Following is the program: Opening song, Grange; recitation, "Independent Farmer," Harry Beach; music, Ruth Merwin; recitation, "Legend Organ Bell," Flora Greenlaw; Matron's offering, Ida Flint; music, Frankie Stevens; essay, "Tobacco—Its Uses and Abuses," E. Greer; song, "Little Blue-Eyed Baby, Sleep," Gussie Wilcox; address, "Sounds of Vowels," J. E. Welty.

All the parts were well rendered, and a social time was spent by all. G. T. R. Sacramento, Aug. 15th.

Urgent Work Forbids.

Prof. Geo. Davidson of the U. S. Coast and Geodetic Survey, having been invited to lecture before the State Grange at Santa Rosa, in October, has promptly acknowledged the invitation in a letter, from which we make the following extract:

You know that I have always held myself ready to help the progress of this State, and therefore you will appreciate fairly the regret I must express at not being able to accept the invitation. Just at this season I am under a dreadful pressure of work, not only in the charge of fieldwork, but in finishing the 2300 pages of MSS. for a fourth edition of the "Coast Pilot." Otherwise I would cheerfully have acceded to your proposition. Very truly, GEORGE DAVIDSON.

While we can but share the regret expressed by the Professor at his inability to do the desired favor, we cannot help congratulating our sea-going citizens, whose voyages are to be made more safely through his devoted labors.

POWDERLY ON TEMPERANCE.—Extract from one of his letters: "I know that in refusing to touch even a drop of strong drink I was and am right. In refusing to treat another to that which I do not believe to be good for myself to drink, I know I am right. In refusing to associate with men that get drunk, I know I am right. In not allowing a rumrunner to gain admittance into the Order of the Knights of Labor, I know I am right. In advising our associates not to rent halls or meeting-rooms over drinking places, I know that I am right. I have done this from the day my voice was heard in the council halls of our Order. My position on the question of temperance is right. I am determined to maintain and will not alter it one jot or tittle."

BRO. JAMES N. LIPSCOMB, W. M. of the State Grange of South Carolina, has been appointed Chief Clerk in the Patent Office at Washington. The *National Farm and Fireside* happily remarks that while this is a serious loss to the Patrons of Texas, whither he was soon to go as Deputy National Lecturer, it is a gain to the country to secure the services of such a man, and the farmers of Northern Virginia are also likely to be benefited by having him with them during exhibition week at Grange Camp.

AGRICULTURAL NOTES.

CALIFORNIA.

Butte.

HELP SCARCE.—Chico *Enterprise*, Aug. 12: The largest force ever employed on the Rancho Chico is now at work, and still the cannery is short of help. Employment could be given to 100 more in the orchards and cannery if they could be had. Even Chinese help is scarce, and none can be had from S. F. In one district the schools were to open last week, but were kept closed that the children might continue to work in the orchards and canneries. A number of boys were brought up to Cana from S. F., but a large number of them turned out hoodlums and would not work. Large quantities of fine fruit will go to waste this year.

THRASHING RATTLES.—Sam Schoonover has been running his thrasher the past week on the ranch of Supervisor Bowers, below Dayton. Last Monday they were thrashing in a field near the river and were throwing in a stack of grain close to a clump of trees, when all of a sudden, just after an unusually large amount of wheat had been placed in the draper, the old machine began to jerk and tear, the fans stopped and the belts on the thrasher began to break loose. The men who were feeding the machine began yelling and climbing into the wagons, calling out "Rattlesnakes! watch out!" The feeder and thrasher were alive and squirming with rattlesnakes of all sizes. They had taken refuge in the stack of grain and had been fed into the machine, completely blocking it up. The men set to work and killed 54 of the varmints, and took a dozen more out of the thrasher. Three or four of the snakes were of unusual size. The rattles were taken from the larger ones and averaged from 10 to 20 to each snake. After several hours' delay the machine was started again.

DAM FOR THE IRRIGATING CANAL.—W. M. Cutter in *Appeal*: There is a point a short distance above Oroville where the river narrows and the banks are perpendicular, where a dam could be built which would take the water out at the elevation necessary; but, as it would have to be 50 feet in height and would constitute a standing menace, it was not selected, although it would diminish the length of the canal more than one-half. The point where the dam is to be several miles farther up, and its size can be judged when I say that an experienced and entirely responsible party is ready to construct it and guarantee its permanence for \$25,000. The dam will be constructed at such a point and its height will be such that even if it did wash out no injury would be done to any one. The dam is really a very small matter; it is the construction of the 11 or 12 miles of canal made necessary by placing the dam at a spot where its washing out could do no damage that requires the great bulk of the expenditure.

Contra Costa.

GRAIN IN SAN RAMON VALLEY.—Martinez *Gazette*, Aug. 13: In an interview with J. M. Stone of Danville, who has harvested a large portion of the San Ramon crop, we were enabled to form an estimate of the yield throughout the valley. The following instances are illustrative of the general yield: Myron Hall of Alamo got 30 cents to the acre on his farm; William Hemme of Danville, 27 cents to the acre; W. Z. Stone, above Danville, 33 cents to the acre of cheviater barley; the Cook farm, in Green valley, over 20 cents to the acre. Grain on Frank Webb's place, Walnut Creek, turned out nearly double what was expected. Notwithstanding the large crop harvested, an average of five cents to the acre was left upon the ground on most of the farms, owing to the fact that a considerable portion of the grain had lodged.

Lake.

COUNTY PRODUCTS.—*Avalanche*, Aug. 11: Ira M. Carpenter brought in for the exhibit some Smith Club wheat. There are 170 heads that were grown from ten kernels of seed. Each head contains 60 kernels, making a yield of 1000-fold. . . . C. W. Bingham brought to this office some Early Crawford peaches that measured nine inches in circumference. They were raised on land that, four years ago, was considered worthless by all but Mr. Bingham. He has certainly proved that this land is, if not the best, at least good for raising peaches. Lake county has thousands of acres of just such, that is Government land, open to those that will take it up.

FROM UPPER LAKE.—Cor. Clear Lake *Press*, Aug. 9: The crops generally prove better than was expected. In fact, the yield exceeds that of any former year in this end of the county. . . . Upper Lake now has the appearance of a spring garden. Fresh flowers and green fields greet the eye on every side. Thrashing is the order of the day. The fruit crop is up to the average, and a cannery would not be misplaced here. The hop crop is extra good, and picking will soon commence.

Los Angeles.

SPUDS, CABBAGES AND LAND VALUES.—Westminster Cor. *Times*: Henry Pope planted over three-quarters of an acre in Early Rose potatoes last spring, and a half-acre in cabbages. He sold in June 140 sacks potatoes at \$1, reserving seed and feeding out small ones, and the cabbages in bulk to Chinamen for \$40; total money receipts, \$180. He has now planted three acres, including the above acre and a

quarter in second crop Early Rose to mature in October. What now is land worth that will pay \$150 per acre for the first half of the year, and a probable \$75 to \$100 the second half? Is it overestimated at \$500? It can be bought, however, for \$150 to \$200, and will only reach its value by subdivision, and the close cultivation which a larger population will justify.

Mendocino.

HOP-GROWERS' MEETING.—Ukiah *Dispatch and Dem.*, Aug. 12: The Hop-Growers' Association of Mendocino convened in the courthouse last Saturday at 2:20 P. M., Pres. L. F. Long in the chair, and J. A. Poage, Sec. On roll-call a majority of members were found to be present. Voted that the officers of the past year be continued in office for the present year. It was resolved that Chinamen hop-pickers should not be paid to exceed one cent per pound.

Monterey.

SAMPLE FRUIT.—The Salinas *Democrat* office was favored last Saturday week with a box of fine apricots and peaches grown in the Corral de Tierra country by T. M. Bramers. The apricots were large, perfectly formed and of good flavor. The peaches were Golden Clingstone, tipped the scale at a half pound each and measured in circumference between 9 and 10 inches. The samples were perfect beauties and tasted as good as they looked. Mr. Bramers informs us that his orchard and vineyard are doing well this year and that he will have an abundance of grapes as well as other fruits.

Plumas.

CHEESE FACTORY.—Greenville *Bulletin*: A. F. Martin is building a cheese factory, which without doubt will become an enterprise of much interest to the dairymen of Big Meadows. The building is 25x60 feet and divided into three compartments. It will be supplied with a cemented cellar. It is estimated that the capacity of the factory will be 10,000 pounds of milk per day. When the factory begins operations it should prove quite a stimulus to the dairying interests of that section.

Sacramento.

INDIAN HOP-PICKERS.—Record-Union, Aug. 16: The hop-growers are bestirring themselves to procure help for the picking of their crop, which should commence in about a week. The Chinese have combined and demand increased pay for picking, which the growers feel unable to give. As quite a number of Indians were employed in this vicinity to gather last year's crop, and worked well, it has been considered advisable to see whether the red men cannot be procured to work this season, and the railroad company has been asked for rates of transportation for 1200 or 1400 natives—bucks, squaws and youngsters—from Reno, as it is thought that numbers can be secured from the vicinity of Pyramid lake and other localities in Nevada. Last year it required about 2000 persons to harvest the hop crop in the immediate neighborhood of Sacramento.

San Benito.

GOOD WHEAT.—Free Lance: Thos. Williams lately brought into this office a clump of wheat, grown on his ranch near San Juan, which is well worth looking at. The wheat, fairly selected from the field, measures five feet eight inches in height; has long, well-filled heads and as plump, bright grain in them as ever grew in this or any county.

San Diego.

GRAIN CROPS.—Union, Aug. 11: The wheat crop of San Diego county this year is carefully estimated at 25,000 sacks, and the barley crop at 10,000. No one in San Diego was hurt by the recent collapse of the wheat ring in San Francisco, as our dealers marketed their wheat two months ago, when prices were up.

San Joaquin.

FRUIT FOR TEXAS.—Stockton *Independent*, Aug. 14: Yesterday a carload of fruit was shipped from this city to San Antonio, Texas. The fruit comprised choice lots of grapes, peaches, pears and plums, grown on the lands of Geo. S. Ladd, Geo. West and other orchardists of this county.

Santa Clara.

PRUNE PROFITS.—W. D. Pollard in *Mercury*: The French prunes on the old orchard of W. D. Pollard, one and a half miles north of Saratoga, yielded in 1886 \$500 per acre, clear of expenses, except trimming and cultivating. These prunes were dried and afterward sold in Peoria, Ill. The orchard is now owned by Lyman McGuire and is 12 years old. In 1884, it brought \$500 per acre, green, at three cents per pound, and has paid nearly \$600 per acre.

ACRES OF DRYING FRUIT.—Santa Clara *Journal*, Aug. 12: The Santa Clara fruit-drier now has about ten acres covered with drying fruit. An immense amount will be dried there this week. They are now devoting their entire time to apricots. The delivery of fruit, cutting, drying, packing and shipping of it makes the business loom up in fine shape. Nothing like it has ever been seen in Santa Clara before.

Santa Cruz.

ORCHARD NOTES.—Pajaronian, Aug. 11: It is the exception this year to see a poor apricot. Either the orchardists have struck the variety adapted for this climate or apricots have scaled but little this year. . . . A Corralitos orchardist informs us that his prune crop will be light this year, most of the fruit having fallen from the trees. At D. A. Rider's mountain fruit farm, above Corralitos, the young prune trees are well loaded with fruit, and a yield of several tons is expected. . . . The blower is being

put in place at the fruit-drier, and the engine is expected here this week. When the blower gets in operation the process of drying will take less time and the drier will not only handle more fruit but give employment to more people. . . . The berry-growers keep up their steady gait in big shipments from Pajaro. The berry crop of Pajaro valley this year will exceed that of any previous season.

Shasta.
